Mr. Cleveland has materially advanced the cause of civil-service reform. The overthrow of the spoils system was not a thing to be achieved by a proclamation of emancipation and incorporated in an amendment to the Constitution. It must needs be a gradual process, making slow advances, step by step, as public sentiment extorted unwilling concessions from the hostile politicians. The passage of the Civil-Service Act, in a spasm of death-bed repentance, by the Forty-seventh Congress, after the stinging defeat of the Republicans in 1882, was one such step. Another most important one was made by Mr. Cleveland when he established the rule of allowing efficient incumbents holding under a four-years' term to serve out that term. From Jackson's day until Cleveland's, a "clean sweep" of such officials had been held proper. It had been made when the last previous change of parties occurred with Lincoln's accession in 1861. In 1885 the Democrats had been denied all chance at the Federal offices for a quarter of a century, and all the spoilsmen in the party wanted Cleveland to follow Lincoln's example and "turn the rascals out"—rascal meaning a Republican incumbent. He refused to do it, and long after the inauguration of a Democratic President hundreds of important and lucrative offices, scattered all over the country, remained in the hands of Republicans—each, as the months and often the years passed before the incumbent's term expired, an impressive object-lesson. These lessons have sunk deep into the public mind and have left an enduring impression. Neither Benjamin Harrison nor any other President will ever make a "clean sweep" of office-holders, good, bad, and indifferent, because Grover Cleveland broke up the practice. This is a great service, rendered at a cost of private comfort such as the liveliest imagination cannot easily exaggerate.

The Civil-Service Law has been, on the whole, well enforced, and large additions have been made to the classes under the rules, although the most important of these additions—that of the Railway Mail Service—was far too long delayed. In other relations to civil-service reform Mr. Cleveland was less successful. Whether consciously or not, he seems early to have conceived a notion of applying a sort of rude local-option principle to the subject. That is to say, where, as in New York city, in Brooklyn, and in Massachusetts, he found public sentiment pretty well educated on this question, he would live up pretty well to the spirit of his voluntary promises to the civil-service reformers by such acts as reappointing Postmaster Pearson of this city and three or four Republican postmasters in Massachusetts; appointing a new postmaster in Brooklyn, who, although a pronounced Democrat, proceeded to conduct the office strictly on business principles; and selecting a pronounced civil-service-reform Democrat for Collector of the Port of Boston. On the other hand, in States like Maryland and Indiana, he gave the spoilsmen almost as free a rein as Andrew Jackson had done two generations before, and appointments of the most disreputable sort were made in the Baltimore Custom-house and the Indianapolis Post-office. This was as serious a mistake from the political point of view as from that of the public interest. The partial concessions to the spoilsmen never overcame their disgust that the surrender had not been complete, while they dampened the enthusiasm among reformers which exhibitions of independence in some quarters had aroused. The result was that Mr. Cleveland lost strength with both elements. Even in Indiana, where there was supposed to be least sentiment in favor of reform, and where consequently least attention was paid to it, the Democrats lost several Congressional districts in 1886, after filling the offices with spoilsmen of the Aquila Jones stripe; and Mr. Cleveland failed to carry the State in 1888, although he had carried it in 1884, when the Republicans held all the offices. Not the least misfortune of these and like offences was the fact that they obscured the value of the real service performed in the general refusal to apply the "clean-sweep" rule. But it must always be remembered that what was hoped for by the most sanguine was beyond reasonable expectation. There are limits to the capacity of one man for resisting the "pressure" of a party which had polled for that man nearly 5,000,000 votes, which wanted twenty times as many offices as there were, and which wanted them quick.

> "What's done we partly may compute,
> But know not what's resisted."

Mr. Cleveland has rendered great service in resisting the tendency towards paternalism in government. This tendency had been steadily gaining strength for a long period, and had gone so far in 1881 that Gen. Garfield, in his inaugural address, advised the assumption by the Federal Government of a share in the work of education in the States. Mr. Cleveland revived the true doctrine. In his veto of a bill appropriating $10,000 from the national Treasury to buy seeds for some Texas farmers who had suffered from drought, he said, after a reference to the power and duty of the general Government: "A prevalent tendency to disregard the limited mission of this power and duty should, I think, be steadfastly resisted, to the end that the lesson should be constantly enforced that, though the people support the Government, the Government should not support the people." In accordance with this principle, he vetoed the Dependent Pension Bill, and thus thwarted the raid of the pension agents upon the Treasury. The belief that he stood ready to administer a similar blow to the Blair bill prevented the final passage of that measure, until now the sentiment of the country has pronounced against the policy of Federal aid to education. The many vetoes of private pension bills not only represented opposition to the idea that the Government is a sort of benevolent society, but also illustrated the remarkable conscientiousness which Mr. Cleveland brought to the discharge of all his duties. It will probably be held in future that the wholesale use thus made of the veto prerogative was ill-advised, as tending somewhat to cheapen it both in popular esteem and in influence over Congress. On the whole, however, Mr. Cleveland greatly benefited the nation by his consistent attitude of opposition to legislative extravagance and recklessness.

Mr. Cleveland has given the country striking exhibitions of courage. Such was the veto of the Dependent Pension Bill—the first objection ever raised by a President to a general pension measure; an objection raised by a President who thereby subjected himself to the charge of having been elected by rebels and copperheads, and of thus venting their spite against Union soldiers; an objection which every consideration of personal and partisan advantage operated to withhold. Such, too, was the message to Congress of December, 1887, declaring for tariff reform, and necessarily making that dreaded question the issue for the campaign in which he was the predestined Democratic candidate, and, in the opinion of Democratic politicians, sure of success if he only kept silent. Mr. Cleveland failed of re-election, but the display of manly independence and devotion to the public interests

which so many politicians think caused his failure, has not been lost upon the people, and will not be forgotten.

That there were more aberrations from the path of duty during the last half of his term than during the first half, must be admitted. The reason is clear. During the first two years Mr. Cleveland was thinking how to be a good President during the term for which he had been elected; thereafter he was trying to secure a chance to be a good President during a second term. In his letter accepting the nomination in 1884, he had foreshadowed what actually occurred in his own case. "When we consider the patronage of this great office," he then said, "the allurements of power, the temptation to retain public place once gained, and, more than all, the availability a party finds in an incumbent whom a horde of office-holders, with a zeal born of benefits received and fostered by the hope of favors yet to come, stand ready to aid with money and trained political service, we recognize in the eligibility of the President for reëlection a most serious danger to that calm, deliberate, and intelligent political action which must characterize a government by the people." Mr. Cleveland would have been a better President if he had not tried to get a second term. But, as it was, he has been one of the best Presidents we have ever had —a model of industry, an exemplar of honesty, a representative of common sense, an embodiment of courage; in short, an excellent type of those homely virtues upon which the future of the republic depends.

SECRETARY BAYARD.

THE time has not perhaps come to do justice to the retiring Secretary of State. Few persons who have ever occupied the office have suffered more obloquy. Few have had greater difficulties to contend with. Few have suffered in silence under greater or more galling misrepresentation. No one, we venture to say, from the time of Thomas Jefferson, first Secretary of State, has been governed by purer motives, more patriotic impulses, more self-denying reticence and fidelity to the high interests under his charge. The measure of his ability cannot be determined now to the satisfaction of all. So much of heat and rancor has entered into the foreign complications of the past four years, and especially into the fishery dispute, that a calm judgment is not now to be looked for; but we are persuaded that Mr. Bayard's vindication will not be long deferred, and that when it comes it will be lasting. We believe that when we shall be a little further removed from the smoke of strife that has clouded Mr. Cleveland's Presidential term, and when (if ever) the Irish vote shall cease to be a peculiar prize in the field of party contention, Mr. Bayard's administration will be generally regarded as one marked by sound judgment as distinctly as it has been by high purposes.

In drawing any comparison between Mr. Bayard and other recent heads of the State Department we must bear in mind that the fishery question had been at rest for more than thirty years, except during a brief space prior to the negotiation of the Treaty of Washington, and that in this negotiation it was altogether subordinate to the greater issues growing out of the war of the Rebellion. The *Alabama* claims so overtopped everything else that fishing rights and fish tariffs were thrown into the balance, the one against the other, with scarcely a note of opposition. The Halifax award produced some discreditable murmuring—it is always discreditable for a party who has submitted a case to a tribunal of his own choosing, to whine over the verdict. So completely, however, had the fishery dispute been forgotten when Mr. Bayard came into office, that few people knew that such a thing had ever existed. The whole nation had to be educated upon it, and, naturally enough, the party in opposition seized upon it to make trouble for the party in power.

This is not the time or place to review Mr. Bayard's negotiation with Great Britain in detail. What we wish to direct attention to —what, we are convinced, future generations will most concern themselves about—is the fact that Mr. Bayard strove, against great pressure, for peace and good will among men and among nations. It is one of Mr. Webster's chief titles to glory that he negotiated the Ashburton Treaty. Then, as now, extravagant claims were made to the "rights" in dispute. Then it was territorial instead of maritime jurisdiction that constituted the body of the contention. Probably some persons can be found now who think that Mr. Webster gave up too much territory west of Lake Superior for the sake of a more immediate advantage to the State of Maine, but all such considerations are sunk in the noble achievement of peace and amity between two great nations. It is the true and ineffaceable judgment of both countries, and of other nations as well, that Mr. Webster is entitled to the thanks of mankind for bringing to a peaceful and honorable close a dispute of much acerbity and danger, and that his great influence was given to the stilling of passions and the prevention of bloodshed.

Now, it must be said for Mr. Bayard—and this nobody will deny—that he has carried the country through an angry dispute which has lasted his whole term of office without a breach of the peace or anything akin to it. He was confronted with this difficulty when he first came in. He turns it over to his successor in no worse plight than he received it, and this, considering the opportunities and great provocations for mischief, is no small achievement. We think that the treaty which the Senate rejected was a good one, and that if it had been negotiated in the same identical words by a Republican Secretary, it would have been ratified. But, be that as it may, it stands to Mr. Bayard's credit that he has preserved friendly relations, without dishonor, with Great Britain and with Germany, in the midst of unwonted clamor, and in spite of the strongest temptation to reap partisan advantage from the passions of the hour.

This is Mr. Bayard's chief claim to the gratitude of his countrymen; but when a closer investigation comes to be made into the records of his office, it will be found that he has administered his office with stricter conformity to the principles of civil-service reform than any other man in recent times who has held it—than any other in recent times who has held any Cabinet office, with the exception of Mr. J. D. Cox and Mr. Schurz. Whatever may be the judgment of his contemporaries on his foreign policies, his administration of the consular service and of the Department at Washington will command the hearty respect of all those who are opposed to the spoils system in politics.

PRESIDENT HARRISON'S INAUGURAL.

THE inaugural address of a new President is a part of the ceremony of introduction to Congress and the people. As it has no official place, it is never referred, as messages are, to committees of the House or Senate having charge of the several subjects considered. It has scarcely any influence on legislation, but is always looked for with interest as indicating the personal views of the President on a small variety of current political topics. Usually the inaugural address invokes attention to the virtues of morality, temperance, obedience to law, Christian charity, and toleration; and these passages are always much prized by the mass of the President's political supporters. He would indeed be a bold President who should omit to pay this tribute to virtue. President Harrison has done his full duty in this regard. Whatever his administration may bring forth, he has started on as good a basis as can be imagined. Like his predecessors in office, he has also a high degree of confidence in the future of the republic. In short, he is equipped with broad and generous ideas which harmonize with the inclinations and cheer the hearts of all good citizens.

When we come to look at particulars, we find that Mr. Harrison is in favor of protection to home industry on the plan of the fathers, that he favors steamship subsidies, at least upon North and South lines, that he believes in a more liberal system of pensions, that the revenue should be reduced without "breaking down our protective tariff or seriously injuring any domestic industry," that we should not be too economical, and that our navy should be increased and improved. On the subject of foreign relations, he holds that European Governments ought not to acquire new lodgment on this Continent, and especially not on any line of water communication between the Atlantic and Pacific Oceans; also that our treaty rights and commercial rights in Samoa ought to be respected and enforced. It is gratifying to know that the President has "altogether rejected the suggestion of a special executive policy for any section of our country." We shall not ask who made the bad suggestion, or in what manner it could have been enforced under the Constitution. It is enough for us that President Harrison rejects it altogether, thereby saving himself and everybody else a deal of trouble. On the subject of civil-

service reform, the President's utterances are not as decisive as we could have desired. He says in effect that he does not wish to promise more than he can perform. There is a degree of frankness in this which we can commend, provided he really does perform all that he can. As regards the Civil-Service Law, however, he is more emphatic. He says that the heads of departments and all other public officers will be expected to enforce it fully and without evasion, and that he hopes to do something more to advance its principles, as the present law empowers him to do.

Since the issue that divided parties in the recent campaign was the tariff, we examine that part of the inaugural address somewhat more attentively. Here we perceive the confusion of ideas that marked Mr. Harrison's campaign utterances on that subject. Protection appears to his mind not as a means to secure an end—namely, the building up of certain specified industries—but as a good *per se;* and this, he tells us, was the idea of our forefathers. We are now, he thinks, reverting to the policy of the fathers. He says:

> "The revival at the end of the century of the same patriotic interest in the preservation and development of domestic industries, and the defence of our working people against injurious foreign competition, is an incident worthy of attention. It is not a departure but a return that we have witnessed. The protective policy had then its opponents. The argument was made, as now, that its benefits inured to particular classes or sections."

The fathers, we venture to remind Mr. Harrison, took the view that protection was a tax levied upon all the people in order to give certain industries a start, to naturalize them, so that they might within a brief time go alone and do without the tax. Nor did it ever occur to the fathers that such a tax was a help to the wage-earning class. That is a late discovery. Mr. Harrison, of course, did not intend to falsify history in this particular. He has simply taken the campaign speeches of his own side as the truth without seeking to verify them. The fathers would have been much amazed if they had been told that protection was to be everlasting and on an increasing scale because it was a good thing in itself—as much as if they had been told that the war of 1812 was a good thing in itself and ought to be prosecuted after the terms of peace had been settled. "It is not a departure but a return that we have witnessed," says the President. When did we depart and when did we return? It does require some charity to read this calm statement, and then to recall the successive steps that have been taken during the past quarter of a century to pile up protective duties, until they have reached the pinnacle of 47 per cent. average on dutiable articles. The President is speaking of the end of the century as marking a return. Is it a return to the tariff of 1789, averaging 8½ per cent., or to any other that anybody can name? Ah, Mr. Harrison, any "return" that could possibly take place would be towards lower duties, and if you do not know this, you should ask your new Secretary of the Treasury to point out the year in which protection stood at as exorbitant a rate as now.

THE CABINET.

We presume few well-informed persons have seriously doubted, since Gen. Harrison's nomination, that Mr. Blaine would be his Secretary of State. The evidence of a bargain to that effect in the Convention, as a condition of the nomination, is as strong as evidence of that kind can ever be. Mr. Blaine, in fact, represented a much larger proportion of the party than Gen. Harrison did. He was, as a politician, the natural product of twenty years of party history after the war. His career and qualities illustrated the growth of the money power and the speculative spirit within the party, under the influence of an inflated currency and high tariff and in the absence of all serious criticism or opposition. His audacity, his good humor, his fondness for coöperative ventures, his horror of rebel brigadiers, and his contempt for reformers, were admirably suited to the party temper, and made his nomination sooner or later inevitable. He lost the election in 1884, in spite of the Irish vote, because he could not keep the small minority to whom his ways were odious, and who held the balance of power. But the attachment of the bulk of the party to him was never seriously shaken. Consequently it was a necessity that if it was held dangerous to run him again in 1888, some arrangement should be made to give him a high place in the Administration. That Gen. Harrison was cognizant of and a party to this arrangement we have no doubt. Some of the Mugwumps, who went back to the fold last year, could not bring themselves to believe it during the canvass, but it was none the less true, as they now see. Blaine was offered the State Department a few days after the election, a little sullenly perhaps, but loyally and punctiliously.

As to the amount of influence he will have, it is, of course, useless to speculate. We believe he has not thus far been consulted about anything. President Harrison has probably been somewhat nettled by the predictions that Blaine would "dominate" in the Cabinet; and it may be the Maine statesman will accordingly be confined strictly to his own Department. Eight years ago this would, perhaps, hardly have been possible. Blaine was younger then, and in much better health than he is now, full of what the Irish call "divilmint," and eager to make some more money. Time and disappointment have told on him; his natural force is considerably abated, and he is better off pecuniarily. We may, therefore, reasonably expect a less "brilliant" foreign policy, and in fact a delicate man's shrinking from avoidable troubles of every description. Whether he can long abstain from instructing President Harrison how to carry on the Government, remains to be seen, but that President Harrison will resent anything of the kind is tolerably certain.

Mr. Windom is another of the statesmen of Garfield's Cabinet who lost his place through Guiteau's crime, and to whom the party may, therefore, reasonably think it owes another opportunity. His administration of the Treasury from March, 1881, until Judge Folger succeeded him in November of the same year, was in all ways creditable. He went back to the Senate, and served the remainder of his unexpired term, but was not re-elected in 1883, having somehow lost his hold on his State. The principal agency in this disappointment was, it is said, the distribution in Minnesota of a photograph of a very fine house he had built himself in Washington, which, it was held, was grander than a true friend of the people would be willing to inhabit. At any rate, since then he has lived in New York, and occupied himself with New York enterprises, notably the Arcade Railroad, the bonds of which he has unsuccessfully tried to sell in various European capitals. Consequently he may now be considered, to all intents and purposes, a "Wall Street man," and how his appointment can, under these circumstances, be made to satisfy the West, we do not see; but if the President sees it, it is, of course, sufficient. The office of Secretary of the Treasury is yearly losing the importance it possessed during and for some time after the war, owing to the rapid disappearance of the public debt and the settlement in one way or another of the currency question. The Secretary is gradually ceasing to be a Minister of Finance, in the European sense—that is, a man who has to use his wits to find ways and means of meeting the public liabilities and preventing monetary disorder. He is becoming more and more an ordinary administrator, charged with the task of simply seeing that a great revenue is collected by honest agents, and that the drafts on it of extravagant heirs are duly honored. Great financiers are, in fact, out of place either in a nation or in a household which does not care how much it spends. The disposition of the surplus pending the action of Congress is no doubt a charge of considerable difficulty. Apart from this, Mr. Windom will find his task a simple one. The principal part of it will be, or ought to be, the overhauling of the customs service, which Mr. Fairchild claims that he has left in a most unsatisfactory condition.

As regards the other members of the Cabinet there is little to be said. Gen. Tracy is the only one about whom much is known in these parts, but he is the right man in the wrong place. He would have made an excellent Attorney-General; what kind of Secretary of the Navy he will make, time only will tell. Mr. Wanamaker, as has been generally expected, gets the Post-office, under conditions which President Harrison must know, and, knowing, must deplore and feel ashamed of. That Mr. Wanamaker will administer the office respectably we have little doubt, and that this will after a while be used as an argument, even by clergymen and religious newspapers, in favor of allowing Cabinet offices to be purchased by contributions to campaign funds, we

have just as little. Nearly all corruption begins under some harmless guise. Votes are always bought for the good cause; decisions are always sold to the right side, and we finally get to the comfortable conclusion that not only is God with the big battalions, but that He makes political debauchery one of His instruments for good. The way the mind of a religious editor or a political clergyman sometimes plays round a proposition of this sort, is a very interesting bit of intellectual gymnastics.

REPUBLICANISM AT THE SOUTH.

One of the chief political aims of the incoming Administration is the development of a strong Republican party in the South. Lincoln assumed the Presidency by virtue of an election in which not only had his party failed to secure an electoral vote south of Mason and Dixon's line, but not a single ballot had been cast for the Republican ticket in ten of the old slave States, while in most of the other five the Republican votes scarcely rose above the dignity of scattering. Harrison received no electoral votes from any of the former slave States; and while the Republican party has become an active force in several of those States near the border line, its vote in most of the cotton States last fall was extremely small. Moreover, the party is even weaker than was indicated by the number of ballots it cast in some of these States, because the votes it actually polled included scarcely any which were cast by men of education, property, and standing—the sort of men which a party must have to give it power.

It is as desirable as it is natural that the Harrison Administration should seek by all legitimate means to strengthen the Republican party in the South. Sectional parties are not good for the nation. The North and South alike will be benefited by a recasting of lines which will cause the men of intelligence, property, and standing in the South to divide their support between the two parties in the same way as men of this class at the North do. One may go even further, and say that it would be better for the Democratic party throughout the nation to have a strong Republican party built up in the South. The Democrats have lost a good deal more than they have gained by having the South solid for their party, and could well afford to exchange two or three States in that part of the country which they have held the last dozen years, for two or three Western States which might before this have inclined their way if the solidity of the South had not deterred them from such a change of base.

In considering how to build up the Republican party at the South, President Harrison has one great advantage. An experiment has been tried which shows with perfect clearness how not to do it. Eight years ago, just as the last but one of the Republican Senators whom the South had sent to Congress during the reconstruction era disappeared, there came upon the stage a man who was hailed as the first in a line of successors who were to restore the party in the South to a power even greater than it had wielded in its palmiest days, during the early years of Grant's first administration. William Mahone was welcomed with outstretched arms by the Republicans of the Senate, and Mr. George F. Hoar, claiming to speak for the people of New England, burst forth into loud strains of joy over the evidence which this Virginian's coming furnished that the South was "turning its face towards the morning." Two years later Mahone was joined by another Virginian, and Riddleberger stood forth before the country as another representative of a rejuvenated Southern Republicanism. The Arthur Administration lent all possible favor to the experiment. The Federal offices of Virginia were turned over to Mahone, and he was given all the support he could ask from the standpoint of practical politics. The Union League Club bestowed upon him the favor of its countenance—and of its treasury. Leading Republican newspapers endorsed him as a great leader.

Eight years have passed. Mahone's term has expired, and the seat which he occupied has been filled for two years by a Democrat. Riddleberger's term expired at noon on Monday, and a Democrat succeeds him. Mahone is a thoroughly discredited man. Everybody recognizes him to have been a political boss of the most odious type, and nothing more. Riddleberger has for years past been a standing nuisance in the Senate through his drunken habits, and on the last night of the session had to be removed from the chamber by force because he was so disorderly. The Republican Senators rejoice at getting rid of a cheap politician who has disgraced the body to which he belonged, and securing in his place a gentleman. Republicans everywhere are happy that the party has no further responsibility for either Mahone or Riddleberger.

The end of it all renders ludicrous in the retrospect such anticipations as were entertained by men like Senator Hoar; and yet such an end was seen by clear-sighted men to be inevitable from the outset. Mahone gained power in Virginia on a platform of repudiating the State debt. Dishonesty was thus the corner-stone of the political structure which he reared. The corrupt methods of the spoilsman, naturally enough, were the only sort which such a man knew how to use. His idea of building up the Republican party of the South was to attract voters by demagogism and to buy them with offices. Northern Republicans would have ridiculed the idea that a party could be built up in the North by such means. The result of the Virginia experiment should prove sufficient to show them that there cannot be two standards of political morality in a country. If the Republican party at the South, under Harrison, is to succeed, it must begin by being decent, and elect to office other men than repudiationists and drunkards.

THE DEBATE ON "STANDARD OIL."

The debate in the Senate on the oil-transportation clause in the Inter-State Commerce Bill on Wednesday and Thursday of last week was one of the most instructive of the session. It arose on an amendment to the bill inserted by the House, providing "That it shall be unlawful for any common carrier, subject to the provisions of this act, to carry refined oils and other petroleum products, cotton-seed oil, and turpentine for any shipper, in tank or cylinder cars, who shall own, lease, or control the same in any manner, except upon the condition that said carrier shall charge the same rate for the transportation of said products in wooden packages or barrels, in car-load lots, as in said tank or cylinder cars, the said tank and cylinder and said wooden packages and barrels being carried free in each case." This proposition was supported by Senator Sherman in a running debate filling three or four pages of the *Congressional Record*, in which the Ohio Senator was at his best. It is seldom that we find anything in the pages of that publication more logical, pointed, and convincing. In dealing with the Standard Oil Company Mr. Sherman was respectful and even friendly in the terms of his discourse, but nevertheless firm in his resolve to expose and, if possible, break down their practical monopoly in the distribution of oil throughout the country. In this matter he has failed for the present, the Senate having voted against the amendment of the House; but the discussion has awakened so much interest and attracted so much attention that the question cannot be looked upon as settled.

The facts in the case were brought out in an official way, in the case of Rice vs. the Illinois Central Railway, before the Inter-State Commerce Commission. The Standard Oil Company supplies its own tank cars and gets them hauled by the railroad companies, so that the rate for carrying its oil is less by perhaps 20 per cent. than the charge for oil carried in barrels. Other shippers of oil are either unable to pay for tank cars or are prevented from getting them, since the builders refuse to make any except for the Standard Company, lest they lose the trade of that powerful organization. After hearing the arguments and testimony, the Commission held that "it is properly the business of a carrier by railroad to supply the rolling stock for the freights he offers or proposes to carry; and if the diversities and peculiarities of traffic are such that it is not always practicable, and consignors are allowed to supply it for themselves, the carrier must not allow its own deficiencies in this particular to be made the means of putting at unreasonable disadvantages those who make use, in the same traffic, of the facilities it supplies." This interpretation of the law left it somewhat a matter of doubt how much, if anything, should be allowed by the railroad as a rebate to the Standard Company for the use of its cars. Of course it makes no difference to the Standard Company whether it gets its oil hauled for 20 per cent. less than the shipper in barrels, or whether it pays equal rates and gets a rebate of that amount for the use of its tank cars. The doubt seems to have been removed by a subsequent decision, quoted by Senator Cullom holding that no rebate could be allowed for the use of tank cars, but the decisions of the

Commission are not law; they are only prima-facie evidence for the use of litigants. The amendment of the House to the inter-State bill was intended to remove all doubts and delays, by providing that the railroad companies shall either supply their own tank cars, or carry in barrels for exactly the same rate as they carry in tanks, per pound or gallon of oil.

It was objected on the other side that nearly all railroad companies hire rolling stock more or less, and pay for its use, and that to deny this privilege in the case of tank cars would be to make an unjust discrimination. Senator Harris of Tennessee put it strongly in this way: "I say, if one producer has invested a half-million dollars in tank cars and rolling stock, and another producer has not invested a dollar in any such thing, and the carrier is compelled to charge exactly the same price per gallon for transporting oil between these points, you have by law worked out a gross inequality and discrimination in favor of one and against the other." This argument would have been stronger if Senator Harris had answered the point made by Senator Reagan a moment before, that it is the prime and foremost duty of the railroad to supply itself with the means of transportation, and offer the same to all shippers alike. There is hardly any kind of freight upon which discriminations might not be devised if the Harris doctrine is allowed to prevail.

The most forcible objection to the House amendment was made by Senator Cullom, viz.: that this was special legislation engrafted upon a general law—legislating about oil and oil cars when the Inter-State Act dealt only with principles, leaving details to the Commission and the courts. As to oil transportation, Mr. Cullom read from another decision of the Commerce Commission, that of Scofield vs. the Lake Shore Railroad Company, that "the preference thus given to oil shipped in tank cars as against oil shipped in stock cars in car-load lots is, we think, unlawful, and must be regarded as forbidden by the act to regulate commerce." This was all that the House amendment sought to enact, and being presumably the law now, although it had not been so pronounced by a real court, Mr. Cullom was opposed to meddling with the matter at all by legislation.

To Mr. Cullom's objection that this was special legislation, Mr. Sherman replied by quoting from the first report of the Inter-State Commission, in which it was shown that there were "outside organizations" engaged in the business of transportation between the States, as for example tank-car companies, who were just as much tempted to disregard the principles of equity and justice as the railroad companies, and that the purposes of the Commerce Act could not be fully reached without bringing these secondary agencies under the same rules. In other words, the original act had been defective because Congress had lacked information. If the facts had been known in the beginning, they would have been provided for in the beginning by some clause like the pending amendment. Replying to several Senators who contended that the Standard Oil Company had reduced the cost of oil to consumers, and that the proposed amendment would tend to defeat the benevolent designs of the great Trust, Mr. Sherman trampled that nonsense out of all shape, showing that human nature is the same in the Standard Oil Company as everywhere else; that in matters of business it takes all it can get, and that if its competitors are crushed out, there will be no restraint upon its exactions. The House amendment was tabled by thirty-four yeas to eleven nays.

THE APOLOGY OF THE LONDON TIMES.

THE apology which the London *Times* has published for its performances in the matter of the Parnell letters has been generally pronounced unsatisfactory. It was as follows, after quoting and endorsing what the Attorney-General had said in court:

"Moreover, Mr. Parnell having, in the witness-box, stated that the letters attributed to him were forgeries, we accept in every respect the truth of that statement. In these circumstances we deem it right to express our regret most fully and sincerely at having been induced to publish the letters in question as Mr. Parnell's, or to use them in evidence against him. This expression of regret, we need hardly say, includes also the letters falsely attributed to Mr. Egan, Mr. Davitt, and Mr. O'Kelly. We must add that we firmly believed the letters to be genuine until the disclosures made by Pigott in the course of his cross-examination."

Of course this seems very tame, considering what the injury inflicted has been, but anything stronger or more emphatic would have been out of place. A man may properly make an expression of deep and heartfelt sorrow for great injuries which he has inflicted under a rash impulse, or under the pressure of a sudden and excusable mistake. But when you have pursued a man for two years with an accusation of complicity with assassins, based on forged letters; when you have treated his denials with scorn, and have loaded him with insult about three times a week during the whole of that period; when you have steadily refused to furnish him with the means of vindicating himself, by giving him the history of the documents; when by way of evidence you have offered him nothing but the testimony of "experts" that he lied when he denied his signature; and when you yourself, after all is over, have to confess that you never found out, even for your own satisfaction, where the letters came from, what can you *say* by way of atonement? What sufficient apology for such deliberate and persistent wrong was ever put in writing or expressed in speech? What was the form of excuse which inquisitors made when they found they had broken a man on the wheel by mistake? If that could be found, it would furnish the *Times* with a good model. In its absence we can think of nothing better than the apology the Montana lynchers made to the widow when they found they had hanged the wrong man for horse-stealing. "Madam," said the spokesman, "we must admit you've got the laugh on *us* this time." As matters stand, we think the *Times* has done well to say as little as possible, and to say it quietly and unostentatiously.

The sole duty the conductors have to perform in the matter is one which we can hardly expect from human nature, and that is to help Parnell in making preparations to bring to justice the editor, manager, and solicitor—Messrs. Buckle, Macdonald, and Soames. We ought, perhaps, to include the youth Houston, who supplied them with the letters, but there appears to be a general disposition to let him run—he is only twenty-two—as an inexperienced lad. Mr. Parnell, and the whole Liberal party behind him, owe it to themselves, and to everybody in all parts of the world who has sympathized with and supported them through this ordeal, to see that the men who played this nefarious game are punished in every way known to the law. That three such persons as they have shown themselves to be, should have been left in charge of such an engine of oppression and cruelty as the *Times*, is doubtless the fault of that rather absurd and pompous person the chief proprietor, Mr. Walter; but his responsibility is, of course, only remote and indirect. The three above named are the chief actors in the crime, and the exhibition of fatuity they have made ought not to be allowed to extenuate their offence any more than their calling themselves "a great journal" ought to shield them from the proper pains and penalities.

Some such calamity as this has been impending ever since Mr. Delane and Mr. Morris passed away, and the control of the paper, in fact as in law, passed directly into Mr. Walter's hands. It is, we believe, he who manned it with the wiseacres who have brought him and it so near ruin. Mr. Macdonald's exhibition of himself in the witness box, as a petulant, conceited, and rather silly person, must have been a curious revelation to the London public, who thought that Wisdom herself sat up at night in the *Times* office and saw the paper safely to press. His evidence showed that he considered it a master-stroke in journalism to print facsimiles of he letters on the day of the second reading of the Coercion Bill. After testifying, with almost asinine simplicity, that "six months, more or less, were occupied in investigating the bona-fide character of the documents," he, on his cross-examination, continued:

I may take it that on the 18th of April you were satisfied that the letters were genuine? Yes.

How long previously had you satisfied yourself? I believed the letters were genuine from the beginning.

Without any inquiry? Yes.

From their intrinsic qualities? Yes; from their internal qualities, from their contents. I thought the facsimile letter would be the sort of letter Mr. Parnell would be impelled to write under the circumstances.

Did you think the "make it hot for old Forster" was the sort of thing Mr. Parnell would write? Yes. Mr. Parnell frequently makes use of the expression "make it hot."

In Kilmainham Jail? Yes. Kilmainham Jail was at that time managed in such a way that the mere fact of Mr. Parnell's presence there would offer no impediment to his writing such a letter.

That is your opinion? It is a matter of proof.

You satisfied yourself of the genuineness of the letters some time before you published the facsimile? Yes.

Why did you select the 18th of April for the publication? Because I thought it was a proper occasion.

Why? I thought it was a suitable time to make the public acquainted with the character of men who were prominent in public affairs. There were discussions going on in Parliament which made it an appropriate moment to publish the letters.

Discussions about what? Upon Irish affairs. Every journalist chooses his moment.

You chose the moment when the division on the second reading of Mr. Balfour's Crimes Bill was to take place? Yes.

Of course it makes little difference in what terms a man of this sort apologizes when he is found out.

We trust that, in the general uproar, the two "experts" who were waiting to testify that Parnell's signatures were genuine will not be overlooked. The Attorney-General tried to get their evidence in before Pigott was examined, but failed. They must now be thanking an overruling Providence for their escape from an exposure which would have been ignominious as well as droll. They seem to have overlooked the fact that traced writing gave their "science" nothing to work on except unsteadiness in the writing, and that all their lore about the comparison of the formation of letters would in this case have been wasted. They are probably now lying as quiet as possible, waiting for the storm to blow over.

A GERMAN VIEW OF ENGLISH ECONOMICS.

Prof. Cohn of Göttingen has an article in the January number of the *Jahrbuch für Gesetzgebung* on "The Present Condition of Political Economy in England and America." The title is in some respects misleading. The article says almost nothing about America and very little about the present day. It is, nevertheless, a valuable one, not merely on account of the many really acute things which it contains, but still more for what it indicates as to the point of view of the critic and the mental attitude of the German school.

One noticeable thing which distinguishes it from similar articles a few years ago, is the infrequency of allusion to the historical method. Cohn himself never committed the error of undervaluing abstract reasoning in the way that some of his associates did; but it is significant of a change of attitude among the Germans that Cohn should really say what he thinks. It has become obvious that the so-called historical method, as typified by Roscher, could not do what was claimed for it; that it was unfruitful in discovery, and only of moderate use in criticism. Inductive methods in political economy, as originally conceived by the German school thirty years ago, were very much like inductive methods in physical science as conceived by Lord Bacon—a sort of complicated system of bookkeeping wherein every fact should be entered in an economic ledger, but where there was no available means of arranging the facts in such a way as to make any use of them. Like Lord Bacon, the German historical school talked about induction beautifully, but their discoveries generally were made by an abandonment of their own method. The important change has been that they recognize the fact themselves. Cohn even criticises Jevons, and quite justly, for a failure to understand the relations of induction and deduction in political economy. "With all his mathematical exactness, Jevons makes the stupid logical error [professor of logic though he was] of confusing statistical methods with his mathematical method, when the two are precisely the opposite. The arithmetical side of statistics and the mathematical strictness of deduction are wholly different from one another. In making use of the much abused word 'exact' in application to both of them, he only lays bare the ambiguity of the word itself."

What then, it may be asked, is the difference between the English and the German schools at the present day? It has ceased to be one of method; it has become one of aims and of assumptions. The quotation from Carlyle with which the article is headed is significant: "One thing I do know, never on this earth was the relation of man to man carried on by cash payment alone. If at any time a philosophy of laissez-faire, competition of supply and demand, started up as the exponent of human relations, expect that it will soon end." The Germans object to the English school on the ground that it disregards moral elements in its postulates, and treats of material wealth as the main object of human pursuit. The difference of method has become comparatively small. Menger and Sax, with the whole Austrian school, have followed in the footsteps of Jevons. Cohn himself has used more abstract reasoning on the theory of prices than any English or American economist. In his care for verification he simply follows the example of the best of the English political economists, and breaks away from the traditions of the so-called historical school, whose generalizations were usually not verified at all. It is not to the method of English economists that he takes exception, but to their subject-matter; not to the use of deduction, but to the exclusion of moral considerations.

In one sense this objection is well-founded; in another it is not. It is true that a great many writers of the English school have given cause for these criticisms; but we doubt whether there is any justice in applying them to the school as such. As long as the science remains an abstract one, its propositions take a conditional form. If free competition exists, certain results will follow. The man who studies these results scientifically cannot be said to glorify wealth any more than the student of pure mechanics can be said to glorify brute force. It is only when people draw unwarranted consequences from their abstraction, and say that, because they have assumed that free competition exists, it generally does in fact, and ought to, when it does not, that they lay themselves open to severe criticism. For some reason it seems hard for the German to comprehend that the abstract science can be pursued without the practical errors resulting from it. The so-called Manchester school in Germany has carried these mistakes to their very worst consequences.

One instance where Cohn does conspicuous injustice is to Walter Bagehot. Bagehot was a man who thoroughly understood the facts with which he was dealing. He knew that he was reasoning within limits; he made no secret to himself of the limitations, but within the sphere where his assumptions were correct his results were wonderfully trustworthy. Cohn seems to think that Bagehot claimed more for his science than it actually accomplished, and contrasts him unfavorably with Mill in this respect. To us the contrast seems rather to the advantage of Bagehot. Mill, it is true, said a great deal more about the moral element and brought it considerably more into his reasoning; but the result of partially introducing morals and partially reasoning from another set of assumptions—making the two as it were into a kind of emulsion—is not scientific method, though it may be popularly useful. Nor has it stood the test of experience. A large part of what Mill wrote was cast aside by himself and must be cast aside by any thinker to-day; whereas, Bagehot's writings, whether in the form of articles in the *Economist*, of books on society, or essays on scientific method, are almost as valuable now as they ever were.

When a German writes on political economy, he almost always has a wide scheme of social philosophy in view. An Englishman generally has not. He is concerned with getting the explanation of certain facts which are before him. Bagehot could write social philosophy when he tried—witness his 'Physics and Politics'—and he did it remarkably well. But even in that case, he was concerned with explanations rather than ideals. He is much more intent on explaining the conditions which determine survival than on answering the question whether the results are for the good of the human race. He is not a philosopher any more than Darwin was a philosopher; he is a specialist dealing with his specialty, and anxious to make his explanations fit the facts. What conclusions philosophers may draw on the basis of his reasoning, is no concern of his.

With English political economy thus independent of philosophy, the work of a man like Ingram counts for very little in the history of the science. His address before the British Association, criticising past results from the point of the Comtist philosopher, aroused some discussion; his article on Political Economy in the 'Encyclopædia Britannica' has reached a still wider circle of readers. But on actual economic thought its influence has been trifling. When he criticised economic methods as crude, he proposed to substitute the yet cruder methods of sociology. To speak of his work as in any sense whatever "*epochemachend*," is quite misleading. The fact that Cohn, in spite of his great familiarity with English writers, makes such an error, shows how hard it is for one nation to comprehend the political thought of another.

GUDBRAND VIGFUSSON.

The announcement comes from England of the death, at Oxford, of Gudbrand Vigfusson, the Scandinavian scholar, in his sixty-third year. Since the appearance, in 1855, of his first essay, Dr. Vigfusson's career has been, in his chosen field, one of altogether unprecedented literary activity. Text after text, whose preparation for the press has necessitated the most painstaking persistence and critical skill, has appeared with his name singly or as principal collaborator; extended lexicographical work has been done; essays have been written embodying a wider knowledge of the ancient literature of the North as a whole than has been possessed by any previous historian, and frequent contributions have been made to the proceedings of learned societies and to periodicals. In the death of Vigfusson not only England, but the world has lost one of its most indefatigable workers and the foremost Icelandic scholar of the day. Vigfusson's career is remarkable as well for what it saw accomplished as for its exemplification of the love of learning for learning's sake. His work was such as to command the attention of a public comparatively limited, and the recognition and emoluments that fell to him were, from the nature of the case, restricted in amount; but neither his interest nor his enthusiasm was allowed to flag, and his literary productiveness was continued almost up to the day of his death.

Vigfusson was born in 1827, at the farm-

stead Frakkanes, on Broadfirth, in the west of Iceland. His father, Vigfus Gislason, was a peasant, rich in pedigree, like most of that sturdy class in Iceland, but poor in purse. After the preparatory course at the high school, then at Bessestad, Vigfusson went to the University at Copenhagen, in 1850, as a stipendiary of the Arna Magnusson foundation, which, since its institution in the last century, has done such inestimable service for the general cause of higher education in Iceland. In Copenhagen appeared his first literary work, 'Timatal,' written in modern Icelandic as a contribution to a collection of essays on the history of Iceland published, in 1855, by the Icelandic Literary Society. This treatise, while primarily intended only to furnish a complete chronology of the events recorded in the Icelandic sagas, really marked an epoch in the history of the old literature. Though the antiquity of the sagas had scarcely been seriously doubted, their claim to credence and their reliability as history had been called in question. In Vigfusson's essay all the sagas specifically Icelandic are considered, and the time they cover, the so-called "saga age," from 830 to 1031, is viewed in the light of the common material, which is found so to support and circumstantiate itself that incidentally one of the most potent arguments for the intrinsic worth of the old traditional material is formulated, once for all. Vigfusson's chronology has been in one or two instances superseded; as a whole, however, it is accepted as indisputably correct.

Other works now followed in rapid succession. In 1858 appeared the first volume (the second volume in 1878) of the 'Biskupa Sögur,' lives of the bishops of Iceland, in collaboration with Jon Sigurdsson. In 1860 were published volume xxvii of the 'Nordiske Oldskrifter,' containing several shorter sagas, all edited by Vigfusson; 'Fornsögur,' three old sagas, in collaboration with Professor Möbius of Kiel; and the first volume of the Book of Flatey, 'Flateyjarbok,' in connection with Professor Unger of Christiania. The 'Flateyjarbok,' now for the first time rendered accessible as a whole, is, in its completed form—a second volume appeared in 1862 and a third in 1868—one of the most valuable and well edited collections of historical sagas extant. It contains among its many sagas, short and long, one of the two accounts, called by Vigfusson the northern, of the discovery of this continent by the Norsemen.

Vigfusson's next work was an essay printed as a preface to the folk-tales of Iceland, which had been assiduously collected by Jon Arnason. In it he reviews the whole subject of Icelandic folk-lore, and forms thus one of the most important parts of the work. His next volume was the 'Eyrbyggja Saga,' of which Sir Walter Scott once wrote out a careful abstract; it appeared in Leipzig in 1864. This same year Vigfusson was called to England to enter upon the work which was to occupy him for many years, and which now stands the principal monument to his fame. Richard Cleasby, an Englishman of means and scholarly tastes, in his rambles about Europe had conceived the idea of a dictionary which should open up to the world the then practically inaccessible stores of the old Icelandic language and literature. Aided by an Icelandic amanuensis, in Copenhagen, some rather desultory work had already been done to carry forward his project, but Cleasby's death, in 1847, left the collected material in a chaotic condition, with really little accomplished. His heirs, however, came to the rescue with pecuniary aid, the Delegates of the Clarendon Press were interested in the undertaking, and Vigfusson was ultimately called to Oxford and assigned the task of completing the work. The dictionary did not appear as a whole until 1874, twelve years after Vigfusson entered upon its completion. Although his name occupies a subordinate place upon its title-page, it is, in reality, Vigfusson's work, and not Cleasby's, whose material, indeed, it was found in every case necessary to revise and even, in some instances, to discard as useless. The Cleasby-Vigfusson dictionary has done more, perhaps, than any other work to stimulate an interest in the study, in both England and America, of the language, and through it the literature, of Norway and Iceland. Its scope is the broadest, as it not only aims at full definitions, but at etymologies and abundant references; some of its explanations are short essays on history, law, and mythology. Vigfusson's genius is seen in the dictionary at its best. His knowledge of the old literature is, even for an Icelander who has made it his life study, simply stupendous in its minuteness and range. It must not, however, be overlooked that he had undertaken a more than herculean task in attempting to work out alone an exhaustive dictionary of a whole language. His etymologies are frequently only to be used with the most extreme caution, and his knowledge of the literature, if the condition can be imagined, was often too ready for an absolute accuracy of citation from a sometimes treacherous memory. As a whole it stands, nevertheless, as a monument of indefatigable labor and broad scholarship. It is safe to say that no other man could have performed the task so well.

Vigfusson's next important work was, again, a remarkable one. It was a much needed critical edition, based in part upon new material, of the most important of the family sagas of Iceland, the so-called 'Sturlungasaga,' issued, in 1878, in two volumes, from the Clarendon Press. What rendered it, however, particularly valuable to the student of Old Norse literature was the excursus, which the author calls the Prolegomena, prefixed to the first volume. These modestly named "observations" really constitute a detailed, if a short, history of the origin, authorship, purport, and literary value of the whole prose and poetical literature of the North, and in wealth of material and suggestiveness of idea far transcend anything at all on the subject that has preceded it. It is in the Prolegomena that Vigfusson first promulgates his now well-known hypothesis of the age and origin of the lays of the elder Edda, which, with one or two exceptions, he refers to Norse poets in the Orkneys and Shetlands at a time subsequent to the settlement of Iceland, and in which he sees a parallel development, in that part of Norse territory, to the prose saga in Iceland. Unfortunately, to the support of this and to not a few other no less daring suppositions Vigfusson can bring only ingenious surmise instead of the necessary evidence; and while he, no doubt, from his superior knowledge often sees further and more minutely than his less gifted fellow-laborers in many of his clever attempts to account for phenomena hitherto considered unaccountable, he can scarcely be soberly followed.

Vigfusson's next book, this time in collaboration with Mr. Frederick York Powell, with whom he was thereafter associated, was issued the succeeding year from the Clarendon Press. It was an 'Icelandic Prose Reader,' containing a variety of texts, with grammar and notes, designed for use as a text-book. The most ambitious work after the dictionary, and altogether the most remarkable for its breadth of purpose and the learning it involves of all the author's literary criticism, the 'Corpus Poeticum Boreale,' was the next to appear, in 1883, in two volumes, from the Clarendon Press—an exhaustive collection of the whole body of Norse poetry as contained, not only in the classical literature, the Eddas, the poems of the scalds, and the strophes scattered through the sagas, but as exhibited in the later literature of the Middle Ages, before the religious epic, in verse, but not poetry, had driven out almost everything else before it. With the poems themselves are complete prose translations into English, countless textual emendations, reference and explanatory notes without end; in many instances is given a lengthy excursus on literary history, rhetorical figures, whose overwrought complexity forms one of the chief stumbling blocks to an intelligibility of much of the scaldic poetry, chronology, and mythology. The whole is an elaboration of the suggestions in the Prolegomena, and carries still further the ideas of origin and authorship there first advanced. In it an attempt is made, for the first time in Old Norse poetry, to follow the comparative historical method, manifestly the only correct one if evidence, external and internal, is at hand to substantiate its assumptions. In the poems of the elder Edda, particularly, as they have come down to us, there is, unfortunately, no such evidence; and although Vigfusson's suppositions are supported by a familiarity only limited by the boundaries of the literature itself and by a poet's appreciation of the spirit of the original, qualities that have never been united to a like degree in a critic before, much of his theory is, and will long remain, only theory. That he has, on the other hand, often read deeper and truer than his critics, there can also be no doubt, and many of his daring suggestions will be found, in the light of subsequent discoveries, to be in reality but the foreknowledge of genius.

The 'Corpus Poeticum' is one of the greatest critical works in the literature of any language, and it very fittingly marks the culmination and virtually, at the same time, the end of Vigfusson's remarkable career. But one book succeeded it, 'Sigfred-Arminius, and Other Papers.' This last published work forms part of a number of short essays by Vigfusson and Powell issued, as a contribution from Oxford, in honor of the Grimm centenary, in 1885. As the title indicates, the principal paper is an attempt to identify the German Siegfried with the Roman Arminius. There are, however, of necessity, phonetic questions involved in the discussion of such a point, and what it suggests, that bring the author upon ground where he is not firmly footed, and the thesis cannot be accepted as proved. In addition to the foregoing, it is safe to assume that a mass of unpublished material will be found. For several years Vigfusson had been engaged upon the compilation of the 'Origines Islandiæ,' suggested in the Prolegomena, which is reported to be so nearly completed that it can be issued this year. It will be a fitting final tribute to his native land of one who has been proud to uphold the greatness of its unparalleled past.

Personally, Vigfusson was a quiet and unassuming man, who loved principally the companionship of his books, and regarded but little the formal requirements of society. To those who knew him well, and where he felt there was a genuine sympathy based upon mutual tastes, he was, however, a genial associate and the stanchest of friends. He lived a life of seclusion at Oxford, where twice distinction sought him out: in 1871, when he was made an honorary M.A. of the University of Oxford, and again in 1877, when the University of Upsala, at the celebration of its fourth centenary, conferred upon him the degree of Doctor of

Philosophy. His particular claims to distinction and scientific recognition are based principally upon his work as literary critic and lexicographer. He was not a philologist, in its restricted sense, as is frequently proved by his etymologies and by the grammatical abstracts appended to the dictionary and to the 'Icelandic Reader.' About the phonetic refinements of the "young grammarians" he knew little and cared less, and modern scientific grammar, foundation and fabric together, was to him, accordingly, a sealed book. That he had his shortcomings as critic has already been pointed out. He is frequently too imaginative and sanguine to fortify himself as impregnably as modern criticism demands. His service, none the less, has been inestimable, intrinsically and for the stimulus of its suggestion, to the cause in which he labored. All in all, he is the one man in his generation who has done the most for the world's knowledge of the literature of the ancient Scandinavian North.

THE STUART EXHIBITION.

LONDON, February 10, 1889.

THE exhibition of the Royal House of Stuart, at the New Gallery, which opened with the new year, continues to be crowded with visitors daily. It is so eminently successful that there is some thought of its being followed by a Tudor Exhibition next winter. This is the first time that this complete collection of relics of the Stuart House has been shown together. Some portion of the objects exhibited here were at the Glasgow Exhibition this summer, but here we have pictures, personal relics, coins, medals, miniatures, seals, and autographs, all relating to the Stuarts and their faithful adherents. Among these objects there are things beautiful in themselves, works of art, ornaments and jewels, exquisite needlework, and also quite ordinary implements of daily use, interesting only because they have been touched or used by the royal fugitives, or connected in some way with the fortunes of the Stuarts. The authenticity of the relics may be depended upon. The Committee has been very rigorous in refusing anything of doubtful provenance, and in most cases the catalogue contains the history and pedigrees of the exhibits. It is clear, also, that the loyalty of the followers of the House of Stuart held these things belonging to them as almost sacred, and would not have parted with them for their intrinsic value, which in many cases would be but small. The chief promoters of the exhibition have been Lords Ashburnham, Wharncliffe, and Crawford, Mr. Magniac, Mr. James Doyle, and Mr. Scharf, of the National Portrait Gallery, besides many others.

Very noticeable for pure, clear painting are the portraits of James V. and his Queen Mary of Guise, parents of Mary Stuart, two half-length life-size figures in a balcony. The Queen is holding a pink and resting on a parapet; the King is touching a Holbein jewel hanging round his neck. The case containing drawings and miniatures of Mary Queen of Scots is particularly attractive. Every one is more or less conscious of having some clear idea of the fascinating woman whose charm was so fatal both to her admirers and to herself. The earliest portrait here is at the age of nine and a half, by François Clouet, or Janet, called Clouet III. This is a drawing on white paper in red and black chalks. There is a similar portrait near it of Francis II. of France at the age of four. At the side of the head of Mary is the inscription, "Marie royne descosse au le age de neuf ans et six mois Lan 1552 au mois de Juillet." This drawing of Mary is at too early an age to have any very marked individuality; the close-fitting coif, jewelled all round, and the rich ornaments of the dress, so carefully drawn, indicate how dexterous the artist was. These drawings in red and black chalk (of which there are other examples here, Magdalen of France, Francis II. as Dauphin, and still another inscribed "le roy françois Segond) belong to the collection of Castle Howard.

The most authentic portrait of Mary is the very fine miniature, by Janet also, lent by the Queen, from the royal collection of Windsor. This is a highly finished portrait, three-quarters length, in a pink dress slashed and embroidered with gold and pearls. The white collar is of the Medici shape; the hair is turned back in the usual Mary Stuart fashion, with a cap embroidered with pearls at the back of the head. This must have been taken while Mary was still in France. She looks about fifteen. One can understand that her face must have gained in refinement and mobility with womanhood. The cheeks are here fat, the expression remarkable for a submissive and rather shy look in the eyes; the long aquiline nose adds to the air of duplicity which one recognizes in all her portraits. The hands, with tapering fingers, are very characteristic. The other later miniatures of Mary are less careful, and all of much later date. "Le Deuil Blanc" is also supposed to be a portrait from life by Janet. The Queen is in white mourning for the Dauphin; a close-fitting French cap, showing the curling hair, surrounds the face, a wimple of white lawn falling from the ears covers the shoulders, and is gathered in folds under the chin, showing the dark dress beneath the transparent veil. Two photographs from other drawings of Janet in the Bibliothèque Nationale at Paris show that Mary's reputation for beauty must have been greatly due to her vivacity and intelligence and power of fascination, rather than to actual beauty of features. The hair, of which the Queen sends a lock, is of a beautiful golden hue, as in Janet's miniature, and her complexion is said to have been dazzling. There are several portraits of Mary, full length, ascribed to Zucchero, to whom she may have sat; but their genuineness as to painter or sitter is confessedly doubtful. The memorial portraits of the Queen, of which there are very many here, are interesting, especially the one of P. Oudry, lent by the Earl of Darnley, and the one lent by the trustees of Blair's College, containing in the background a representation of her execution from the notes of Burleigh's agent, an eye-witness of the scene in the hall at Fotheringay.

Among the relics is the book of hours Mary used on the scaffold, referred to in the account of the circumstances given to Cecil. "All the assembly, save the Queen and hir servantes, sayde the prayer after Mr. Deane as he spake it, during which prayer the Queen sat upon hir stoole, having her agnus Dei, crucifixe, beades, and an office in Latynn. Thus furnished with superstitious trumpery, not regarding what Mr. Deane sayde, shee began verie fastly with tears and a lowde voice to praye in Lattin." There are other books of hours illuminated, and an especially beautiful psalter given by the Queen to Mary Seton, one of the "Queen's Maries." The handbell of silver gilt she was permitted to retain at Fotheringay Castle, mentioned in the inventory of her goods as a "Closchite," is here. According to the fashion of her time, it used to stand on her writing-table. We see also a silver draught-board she gave to Mary Seton. Some leading strings embroidered by Mary for her son, James VI. of Scotland, show her great skill at her needle. Other larger pieces of needlework with which she beguiled the weary hours of captivity are likewise here; we remark especially two curtains, a counterpane, and a valence worked on green velvet by Mary and the Countess of Shrewsbury, while the Queen was at Tatbury in charge of the Earl of Shrewsbury, who treated her with "such care and concern" that she felt safe in this captivity, and worked all day at these complicated embroideries.

The most beautiful of the relics of Mary Stuart is the Limoges ciborum and cover, known as the "Cup of Malcolm Canmore": it is in copper gilt, elaborately enamelled in champlevé. On the bowl are six Old Testament subjects in medallions; on the cover likewise six subjects from the New Testament. This ciborium is said to have belonged to Malcolm Canmore, King of Scotland, 1056-1092, and was given by Mary to Sir James Balfour of Burleigh, one of her stanchest adherents. There is also a Limoges tazza, painted by Jean Court dit Vigier, with the arms of Queen Mary and the Dauphin crown, besides many personal trinkets, rings, seals, clothing, etc. There is a portrait of Darnley as a youth, which is convincing as a likeness of a very pretentious weakling: vain, headstrong, and unhealthy is the impression one carries away. A miniature of Bothwell, with a scar on his cheek, fiercely looking round at the spectator, would go far to prove that in his case history has represented him as he was. In the gallery are letters from Mary's own hand, though some are not considered authentic. The most interesting is the one written to Henry III. of France six hours before her execution, in which she begs the King to gather from her attendants the details of what has passed, and commends her son to his care.

Of the so-called Vandyke portraits here exhibited many are replicas, or copies of a later date even. It is unfortunate that the committee were unable to secure the originals, and accepted so many copies in place of them. The large canvas of Charles I., Henrietta Maria, and two elder children is a replica of the Queen's picture now at Windsor, the first portrait Vandyke painted in England. The three heads of Charles I. painted and sent to Bernini in Rome to guide him in his bust of the King are here in the original by Vandyke, lent by the Queen. They are too well known from the engraving to need comment. There are portraits by Lely and Dobson, also of the unfortunate King, showing him less romantic and distinguished-looking than in the Vandyke portraits. Of these latter the Earl of Warwick sends one of the several versions of the King mounted on his famous white charger going under an arch bareheaded; Monsieur St. Antoine in red holds the King's helmet. This is not nearly as fine as the National Gallery portrait of the same size. Of Henrietta Maria there are many pictures. The most beautiful is a three-quarters length in a blue satin dress, leaning on a table with her right arm, and holding roses in her lap with her left hand. An *amorino* flying overhead is about to crown the Queen. The jewels fastening the blue satin sleeves over the white lawn undersleeves are gold doves with breasts of dark precious stones. This seems to have been a favorite portrait, for we have a replica of the same in green dress here also. In strong contrast to this pretty, rather insipid, face, with large eyes *à fleur de tête*, is the aged portrait of Henrietta Maria, by Claude Le Févre. The face, worn with suffering, is in three-quarters, and the sad, faded eyes gaze towards us with a wistful passing look. The mouth has all the severity of a bigot in its stern, thin outline. She wears a black lace on her head, a falling white collar and cape over her shoulders; and in her left

hand she holds a book, 'The Advantage of Death.' It is a portrait which tells a sad story of a long life of expiation and sorrow. A case in the same gallery contains the clothing worn by Charles I. at his execution, the prayer-book he used on the scaffold, the two shirts still blood-stained. We are told that on account of the extreme coldness of the morning, the King, not desiring to be considered shivering from fear, put on a second shirt. A very fine one with lace and tiny knots of ribbon; his embroidered glove, a piece of his beard, a lock of his hair—all these relics have been carefully treasured by the different families to whom they have belonged, and are now exciting more attention than anything else in the exhibition.

Of the children of Charles I. there are innumerable portraits and miniatures, as also of Charles II. and Catherine of Braganza in a variety of fancy attitudes. In one the little lady is represented as St. Catherine with her wheel and palm. Sir Peter Lely has in this instance considerably lengthened his sitter to the conventional saintly stature. This portrait was painted for Lord Clifford of the Cabal, to whom the Queen presented also the earrings in which she sat. Charles II. at a ball at the Hague is one of the few good and interesting pictures of this period here. Charles, in a flat-trimmed black beaver hat and black dress, is dancing a minuet with a lady in gold-embroidered dress with blue petticoat. The company is looking on, and we see in an inner room a supper table at which people are feasting, the King himself in the post of honor. Of the subsequent Stuarts, James II., Mary of Modena, Prince James Francis Edward, known as the old Pretender, and Princess Maria Clementina Sobieska, Prince Charles Edward and Princess Louisa of Stolberg, and Prince Henry Benedict, Cardinal Duke of York, there are innumerable portraits, in miniature and life size in oil, at many ages, in many attitudes—all very third-rate productions as art, interesting only historically. There is a portrait of Flora Macdonald, in the background of which is written a Latin inscription signed "W. Robertson," referring to the escape of Prince Charles Edward from his pursuers in the disguise of "Betty Burke," the supposed maid-servant of Flora Macdonald. There is a case specially devoted to relics of Flora, and there is a portrait of Charles Edward in the disguise of Bettie Burke. Of this prince, whose earlier days inspired so much enthusiasm and devotion, there are too many relics. Some are quite without value—for instance, a gridiron given him to hold while hiding in some kitchen in the highlands.

The diptych from Holyrood, formerly in the Church of the Holy Trinity, Edinburgh, merits very careful examination. It is supposed by competent judges to be by Van der Goes, although the learned Director of the National Portrait Gallery has discovered in an angle of Margaret of Denmark's head-dress, a principal figure in one of the compartments, four letters, P. R. A. T., which he supposes to be Pratt, as there are books and records showing the existence of two painters by the name of Pratt at Stirling in 1497 and 1502. The meaning of those letters is certainly doubtful. The manner of painting, the exquisite finish, the careful treatment of detail, the type of the angel blowing the bellows in the St. Cecilia compartment, the full harmony of color, and the firm drawing, all remind us forcibly of the picture of the Portinari family in Santa Maria Nuova at Florence, by Van der Goes. The diptych has suffered from scourings and skinnings, which in some parts have destroyed the last glazings, and injured the painting. The first compartment shows James III. of Scotland (1453–1488) and his son, afterwards James IV., both kneeling. The figures are half life-size. The King wears royal robes of red brocaded with gold, under a purple mantle lined with ermine, and an ermine cape. Before him is a desk, on which is an open book. His son, in scarlet and ermine, kneels bareheaded behind him with hands clasped in prayer. St. Andrew, in green drapery, his cross saltire behind him, is presenting the King to the Holy Trinity on the back of this panel. In this composition the head of God the Father is rather Byzantine in character. He is in a red robe, on a golden throne, holding in his arms the crucified and agonized Christ, emaciated and stiff as in so many Flemish representations of the moment when he was taken down from the cross. The Father's mantle is lined with blue; the throne is on the clouds, and golden light surrounds it; the Holy Ghost hovers above. The crystal ball of dominion is at the foot of the throne. On the other panel we have Margaret of Denmark, wife of James III., kneeling to our left, at a desk covered with red, emblazoned with her arms in a lozenge impaling Scotland. Her red bodice is embroidered with gold. She wears an ermine mantle and a black kirtle fur-trimmed. The book before her is open and very beautifully illuminated. A coif enriched with pearls, and her crown, are on her head; her dress, too, has a yoke of gold and precious stones. St. George in full armor stands behind the Queen, holding a banner and presenting her to the Holy Trinity. On the reverse of this volet, St. Cecilia sits beside a small organ, playing from a book of music before her. An angel at the back is working the bellows. In the foreground kneels Sir Edward Boucle, Provost of Trinity College, Edinburgh, for whom, it would seem, this diptych had been painted. One sees his arms azure, three buckles or, parti per chevron argent, on St. Cecilia's seat. It is supposed that in the saint we have the portrait of the foundress of the College, Mary of Gueldus, Queen of Scotland.

Mr. F. G Stevens has supplied the catalogue with historical notes on the pictures and relics, and information as to the provenance of each object. Mr. Grueber, Mr. Jenner, and Mr. Holmes have treated respectively of medals, manuscripts, printed books, and miniatures.

SICILIAN ARCHÆOLOGY.

PALERMO, January 25.

BUT for the irruption of the Normans into Sicily, the island would still be Magna Græcia, and even with the traces of that invasion it is more Greek than Italian in most respects. Invasions in general, and especially by western races, have in most cases brought into the east of Europe better conditions of civilization and firmer ideas of law; but in Sicily the remedy was perhaps overdone, for the effects produced in other parts of the kingdom are here by reaction much in retard. An officer of the Italian garrison said to me lately, speaking from an experience of different parts of the State, that Sicily was a century behind the other provinces. Certainly before the Italian Government took possession of it this was true, and to a degree it must still be admitted that the island is the most backward of all Italy, and modern civilization can only be said to have been established since the railways and bersaglieri have made the repression of brigandage possible. When I was first here, not many years ago, the road to Monreale, only five miles from Palermo, was not safe to travel, and was patrolled by squads of bersaglieri at intervals of half a mile; but I believe the present condition of the island to be as secure as that of any part of the peninsula.

The persistence of the antique habits and the intense conservatism of the Sicilians, and in fact of all the provinces of the ancient Magna Grecia, I believe to be due largely to the obstinate, stereotyped character of the Greek race, intensified, perhaps, by the admixture of the more Oriental elements, Saracenic, etc., which obtained here as it did not in the continental provinces. There is, however, a curious similarity between the Sicilian and the New Hellene—the absence of refined tastes and of adaptability of character; the want of practical common sense and appreciation of veracity; an extraordinary acuteness in the details of business and shortsightedness in the great affairs (traits common to both), as well as the active brain and alertness, so different from the north Italian. But there is a far greater indifference to progress than in Greece, and, so far as I can judge, not the same thirst for knowledge, which I should be inclined to attribute to the influence of the Catholic church, so different from the Orthodox, and so much more powerful in its control of the individual, and naturally in its repression of individuality, the most remarkable trait of the Greek of Greece proper. But the resemblance is still striking even to the casual observer, and to the traveller there is a reminder in the deficiency in the means of communication and accommodation, in which respect he is little better off than in Greek localities. The consequence is, that we know less of the archæology of Sicily than of any other part of Italy or of Greece. The great temples of Girgenti, Segesta, and Selinunte have been known for many years, but are only now fully excavated and fully visible, while the prehistoric traces are still unknown, or unstudied adequately.

It has been a moot question, therefore, among the Italian archæologists, whether the traces of the Pelasgic occupation which forms so important a part of the prehistoric record of Italy had ever extended to Sicily. With regard to one point, the site of the ancient Cephalœdium, now Cefalù, there has been a dispute, and I have just returned from an examination of the remains there, which has shown me how vague are the ideas carried away from any object of antiquity by even a scientific observer who has not been accustomed to classify and compare the class to which it belongs. I was doubly disappointed in the results of my search, first in finding nothing of what I had been led to expect by the account given me, and, secondly, in finding most valuable indications of which I had not suspected the presence. The site, to a student of prehistoric archæology, is an extremely interesting one, and though the evidences of a Pelasgic colonization are not conspicuous, they are sufficient and unique. The ancient city was built on a point of the hard limestone of which the hills about here are formed; this point terminated in a spit, behind which lay a long sand beach. From this nearly level site the ground rises slightly for a few hundred feet to the foot of a massive bastion of rock, an outlying spur of the main chain of hills in the interior, but separated from the nearest hills by nearly a mile, and presenting on every side except one an inaccessible cliff, constituting a natural fortification, to which access was only possible by one break in the cliff. This wall is from three to five hundred feet in height, and about a mile in circumference. Across the space where the break occurs, forming a curtain from bastion to bastion, is a high wall of mediæval construction, but in which are stones of ancient workmanship, evidently the restoration of an ancient defence,

Inside of this enclosure is a cistern of an extremely interesting character; and though the manner of its construction is not by any technical test certainly referrible to the Pelasgic epoch, I have found similar reservoirs in several ancient and abandoned sites, and am disposed to assign them generally to prehistoric builders. There is one in the central enclosure of the Larissa of Argos, of importance, but not of the magnitude of this. They are utilizations of the natural fissures or caverns in the limestone rock, enlarged rudely and cemented so as to hold water; and in this case the cement seems to have served until comparatively modern times, as mediæval structures over the opening at the top show it to have been used during the later occupation. It may be twenty feet wide and deep, even partially filled up as it is by rubbish, and nearly a hundred long, with (at the upper end, where the crevice narrows) a stairway made out of the solid rock apparently; but as there is no means of access to the passage, the rock above having fallen in and obstructed the descent, the examination was of the most unsatisfactory character, and must go for what it is worth. But further on, and in such a position in relation to the enceinte of the present, and necessarily of the ancient fortifications, if such existed, is a fragment of what I must consider a palace of excellent and marked polygonal construction; a wall with a rather elaborate doorway admitting to a passage or hall, inside which are, at right and left, two similar doors, both utilized in the construction of a mediæval house, and one of which still opens into a vaulted chamber of brick—the wall itself being also surmounted by a portion of the mediæval structure. It is to this utilization of the old work that its preservation is due. It is of the later Pelasgic work, with some architectural decoration of a simple kind and such as could be executed in the neolithic age—a doorway slightly narrowing upwards, and a straight lintel like the gates of Mycenæ and Alatri, but not higher than a modern house door. Intending to return the next day, when I hoped the sun would serve to photograph and measure the monument, I neglected to make any drawing or measurement; and as the next day the rain came on worse than before (we have had ten days of it), I had to leave it with no exact record. The quarters in the town were such that a needless prolongation of our visit was too severe a penalty to pay for my memoranda, and we came away in the rain the day after our examination. However, the attribution of the structure to the period to which I have assigned it is beyond question, from the character of the work, at once unlike the Phœnician remains in the island, and the early Hellenic of the Greek colonies, and even earlier work in Greece proper.

The lower city gives even more conclusive testimony, for the entire circuit of the ancient wall can be followed by the Pelasgic foundations, which are in the greater part of it still standing, overbuilt by Hellenic and mediæval work, but still showing at intervals grand fragments of the most solid and ponderous "cyclopean" (as the unworked stone is conveniently designated). Out from the rock on which the town is built gush, one on each side of the town, two rivulets of crystal water, furnishing the supply to the inhabitants. One, that in the largest use, issues in a huge pool of considerable apparent depth, but filled to a certain height by the fragments of the vases which ill fortune has sacrificed on the spot. I wondered if this was not a modern form of the ancient offerings made to the deity of the fountain; for the cleanliness of the place to which the water-carriers came was extraordinary for an Italian town, and there was not a trace of anything but potsherds to be seen in the pool. Of these the quantity was enormous, while none were thrown into the sea, as they might have been. The other fountain was in another sense still more interesting, for the original passage by which the founders of the city had provided for the water-drawers, with its walls of cyclopean structure, still serves for the maidens to go down to the stream; and a dozen of them, more or less, were chattering and crowding on the narrow stone staircase between the door and the water.

The conditions of existence in Cefalù are probably, on the whole, more closely coincident with those of the extreme antiquity of the Italic populations than in any locality we shall find in the realm. Nothing can have changed much except names and other words. The shipping of the town was drawn up on the beach as it would have been in B. C. 1000, and, so far as the lower town is concerned, there is no probability of any further modifications of the external condition than those which grow out of the change in the method of building consequent on the use of mortar; so that the original wooden house of the early Italic populations has become a rude and, to our sense, comfortless stone structure.

Those who visit Cefalù do so in general from an interest in the Norman cathedral of Roger I. (a structure of which an architect can speak more authoritatively than I), or to see its mosaics, which are extremely interesting and very early, probably the work of Byzantine artists. In ecclesiastical history the church is famous as the occasion of the suit in which Bishop Ardouin and the Emperor Frederick II. figure, and the record of which has been published by E. Winkelmann (Innsbruck, 1884) as an episode in the life of the Emperor. Cefalù was then, and still is, the richest diocese in Sicily, its revenues not having been secularized by the Italian Government, owing to its ranking technically as a parish; but its wealth was not then regulated by the same strict construction of the law as now it is, and the process of Bishop Ardouin is one of the curiosities of the literature of the Church of the Middle Ages. Winkelmann drew his text from a copy in the National Library at Paris, but the director of the museum of Palermo, Signor Salinas, in searching the archives of the cathedral during the present restoration, has discovered the original parchment record of the trial. As architecture, this and the other Norman churches in the island, though extremely interesting, have not to me the interest of those of the Norman dynasty at Caen, owing to what seems to be a corruption of the canons of the style—as if the Sicilian churches had been the work of journeymen, or of architects who had to follow a style which was not their own.

As a practical hint to those who come to Sicily, I may say that a visit to the town and cathedral had better be made by the early train from Palermo (the railway now being finished to Cefalù), with the return the same day, for a night passed in the hotel is far from desirable. The filth and primitiveness of the place make a short stay imperative.

W. J. S.

VOLTAIRE AND THE DUCHESSE DE CHOISEUL.

PARIS, February 16.

M. GASTON MAUGRAS, who has published several interesting volumes on Galiani, on Mme. d'Épinay, on the life of Voltaire at Ferney, in collaboration with M. Lucien Perey, gives us now a volume written by himself alone on the relations between the Duchesse de Choiseul and Voltaire. The book has been edited with much care, and has a most agreeable portrait of the charming little Duchess, taken from the original, which is in the possession of Count de Ludre—a pastel made at the time of the marriage of the Duchess, and given by her to her cousin, Count de Ludre, a *maréchal de camp* of the King's armies.

The Duc de Choiseul is well known; nobody better personified the amiable qualities as well as the defects of his age. Count Gleichen, the Danish Minister to France, paints him as "good, noble, frank, generous, *galant*, liberal, proud, audacious, fiery." He was full of wit, and very seductive, though not handsome. His wife can be opposed to those who charge the eighteenth century with universal corruption. Her virtue was never attacked, and she remained all her life a model wife. Walpole has much contributed to enlarge her reputation; he speaks often of her in his correspondence, and paints her, in the most charming terms, as the most amiable and graceful creature that ever came out of an enchanted egg. Mme. du Deffand said of her: "It is a pity she is an angel; I should prefer her to be a woman. She has only virtues—not a weakness, not a defect." When the marriage took place (in 1755) Choiseul was already thirty-five years old; his wife was only seventeen. Louise Honorine Crozat du Châtel had a dowry of a million of revenue.

She was passionately in love with her husband, and always preserved for him a sort of adoration; she believed him to be a great political genius. "I assure you," she wrote to Mme. du Deffand (May 13, 1770), "that he is the greatest man this century has produced. He is so good-natured that people become familiar with him, and do not remark the superior talents and the sublime qualities which his modesty covers; they will be recognized when he is no more, and he will be much greater in history than he appears to us." The Duchesse de Choiseul seems to have looked upon her husband as Lady Beaconsfield did in our time on Lord Beaconsfield. History has not quite ratified her judgment, but the definitive history of the eighteenth century has not yet been written. At the present moment, Choiseul does not appear to us a great political genius, though he certainly was a man of superior abilities.

Choiseul's sister played a great part in his life. She was a proud Amazon, and had great power over him; she looked more like a man than a woman. He married her to a Duc de Gramont, who was a great libertine and very disreputable; three months after the marriage she separated from her husband, but kept the title of Duchess and a magnificent revenue. There was, of course, a rivalry between Mme. de Gramont and Mme. de Choiseul; but they found a sort of *modus vivendi*, and contrived to live together in peace. Choiseul owed his great fortune to Mme. de Pompadour, as well as his marriage, which had brought him an immense fortune. His various properties yielded him as much as 700,000 livres of revenue. On the death of the favorite he was able to maintain himself in power till Louis XV. chose a new one, in the person of Mme. du Barry. He was one of those who were not willing to adopt this low mistress, whom the King had much difficulty in imposing on the court. Mme. de Gramont was very violent against Mme. du Barry. Choiseul tried as much as he could to prevent her from being presented; but Mme. du Barry triumphed, and her presentation took place on April 22, 1769. Mme. de Choiseul and Mme. de Gramont were not invited to the ceremony.

We read in an inedited letter published by Gaston Maugras that "Lycoris [Mme. du Barry] is fast approaching the moment when the Lord will bid her: 'Sede a dextris meis donec ponam inimicos tuos scabellum pedum tuorum.'" Among these enemies were the wife and sister of "the man so powerful to-day, and who to-morrow will perhaps be nothing." The prediction was verified. The King in person attempted to reconcile the favorite with Choiseul, to whom he was accustomed, and whom he did not like to lose. "You conduct my affairs well," he wrote to him; "I am satisfied with you; but beware of the givers of advice. . . . You know Mme. du Barry; she is pretty; I am pleased with her. . . . She has no hatred towards you; she knows your talents, and does not wish you ill." Choiseul was intractable. Mme. du Barry found her instrument in the Chancellor Maupeou, who was quarrelling with the Parlement of Paris. Choiseul had always supported the cause of the Parlements. On the 24th of December Choiseul received an order from the King which exiled him to Chanteloup, his country-house; twenty hours only were given him to make his preparations.

The exile of Choiseul was a *coup d'état*. Paris was thrown into real consternation. Choiseul's departure was changed almost into a triumph; the Duke and Duchess left the capital amid the applause of the people. The philosophers, who were protected by Choiseul, made a great noise, and Voltaire wrote verses in favor of the Minister, who had extended to him his powerful influence in Switzerland. Voltaire had quarrelled with Geneva, and had established himself at Ferney, in the *pays de Gex*, a small district between the Jura and Switzerland. He had established there manufactures of silk, lace, and watches; Choiseul had given his manufactures the benefit of free trade with the other provinces of France.

Chanteloup had been built in 1744 for Mme. des Ursins. Choiseul bought it in 1763, and had made an exchange with the King of the Marquisate of Pompadour, and various other estates, for the forest and castle of Amboise. (Under the Restoration, Chanteloup, which almost touches Amboise, belonged to the Duke of Orleans. The castle of Amboise is now the property of the Comte de Paris, while the greater part of the forest belongs to his aunt, Princess Clementine of Saxe-Coburg.) Chanteloup, with the immense forest of Amboise, was a splendid domain, and Choiseul lived in it in royal style. The first courtiers who asked for permission to go to Chanteloup received this answer: "I neither forbid it nor allow it." This was taken for a tacit permission, and a pilgrimage to Chanteloup became the fashion. The hospitality of the Choiseuls was boundless: there were every day three tables served besides the Duke's. To give an idea of the expense of Chanteloup, I will only say that every month the butcher had to kill thirty sheep; four thousand chickens were needed every year.

The struggle between the royal power and the Parlement continued. Maupeou, the Chancellor, began the war fiercely; he dismembered the Parlement of Paris and created new courts in many places; he abolished the venality of the judicial functions. On the 13th of April, 1771, the Parlement of Paris was definitively suppressed by order of the King, and a new Parlement, composed of the nominees of Maupeou, was installed. This change was applauded by the philosophers. Voltaire had often attacked the venality of the judiciary; the old Parlements had not been lenient to the men of letters. Voltaire tried in vain to separate the cause of Choiseul from the cause of the Parlement; he did not like to seem ungrateful to the former, but he praised Maupeou to the skies. Speaking of Choiseul, he said: "I am like France: I owe much to this great minister"; speaking of Maupeou: "M. de Maupeou has covered himself with glory; he has rendered the kingdom the most important service. Before six months have passed, everybody will bless the Chancellor for having rid us of three hundred *procureurs*" (June 24, 1771). Voltaire wrote a number of pamphlets in praise of Maupeou, and his enthusiasm inspired his enemies to produce these verses:

> "Ne t'arme plus, Fréron, des traits de la satire;
> De l'infâme Voltaire oserais-tu médire
> Après qu'en bas flatteur il brûle son encens
> Sur l'autel détesté du plus vil des Séjans?"

"Oh, what an abomination is this Voltaire!" exclaimed Mme. de Choiseul when she heard that he asked that a civic crown should be given to the Chancellor. In vain did Voltaire send the most amiable and flattering letters to Chanteloup: his protestations of friendship and devotion were despised, he was denounced as a traitor. In her correspondence, Mme. de Choiseul was very cautious; she never said a harsh word of Voltaire. She wrote to Mme. du Deffand: "Say to M. de Voltaire that falling from power does not deprive people of taste, and that we preserve the same admiration for him; but that the circumspection which our position requires does not allow us to have any commerce with such a celebrated man; that his silence is the greatest attention which he can show to our situation, and the mark of friendship on his part of which we shall be most sensible." From that moment Voltaire ceased to try to justify himself directly, but in all his letters to D'Argental, Marmontel, and others, we see him preoccupied with the Choiseuls, and trying to prove that there was no relation, no connection, between their cause and that of the Parlements.

Louis XV. died on May 10, 1774. Maupeou was immediately exiled, and the ancient Parlement was recalled. The Choiseuls returned to Paris, but he was not recalled to the Ministry. Louis XVI. did not like him, on account of his excessive prodigality. When Voltaire came to Paris, in 1778, the Choiseuls did not make him any visit, and Voltaire died without being reconciled with them. In 1784 the financial embarrassments of the Choiseuls became so great that they were obliged to sell their magnificent hôtel. They were soon afterwards obliged to sell Chanteloup. Louis XVI. generously lent four millions to the Duc de Choiseul. In 1785 the Duke became very ill, and died on the 9th of May. Faithful to the habits of all his life, he left very generous legacies to all his friends. The Duchess obeyed all his wishes, guaranteed all the payments, and herself retired to the convent of the Récollettes in the Rue du Bac, where she lived in a small apartment with a single servant. She paid 300,000 écus every year to the creditors of her husband till the Revolution. Her conduct during the Revolution was worthy of her. All her friends became the victims of the Revolution, and she herself was arrested in 1793. She was so much liked by the poor people of her quarter that they put in a petition for her release. She became ill in prison; her sister-in-law, Mme. de Gramont, died on the scaffold (April 17, 1794). Mme. de Choiseul was left to live in poverty, in the utmost isolation. She died on December 3, 1801, in a miserable house, without a relation, without even a friend to assist her. Her body was thrown into the *fosse commune*. And so ended a charming woman, who had been the queen of the most elegant and refined society, who had brought to her husband a princely fortune, and who had, in a time of great corruption, remained spotless and irreproachable.

Correspondence.

TWO MORE.

To the Editor of The Nation:

Sir: (1.) Our English cousins, when they see how silently and smoothly public affairs go on in this country, are sometimes inclined to attribute it to our system of government by committees. They will have a chance now to see how they like it. We can furnish here some fine specimens of organized anarchy, but nothing to surpass the new English County Councils.

The city of London, for all administrative purposes, except Education, Poor Laws, and Police, is henceforward to be under the rule of a council of one hundred and fifty persons, the majority elected in sections for three years, and the rest elected by the others for terms of six years. There is absolutely no leadership or guiding authority, all members being perfectly equal and independent of each other and of any power outside. They do, indeed, elect a chairman and a deputy chairman, but these are and can be nothing but presiding officers, like the Speakers of the Commons and of Congress, or the moderator of our town meeting. They also elect a nominal executive agent, but he will be only a tool in the hands of factions in committees.

The *Spectator* observes with regret that the Council has begun at once to act by Executive Committees. Of course it has—it could not possibly do anything else; and those committees must either be elected by the body or appointed by the Chairman—two methods of which it would be hard to say which is the worst. Says the *Spectator*: "The offset of that system is, that nothing is ever done vigorously, and that responsibility disappears." "The use of committees is the very secret of corruption, and makes administrative efficiency almost impracticable." If this is true, it is rather a serious reflection that this whole country, from the national down through the State governments to the smallest and last-made city, is governed entirely and exclusively in just that way. The *Spectator* suggests as an alternative the formation of a cabinet of seven persons dependent upon the support of the majority. But the advocates of the English parliamentary system maintain, and with justice, that the only defence and possibility of existence for a ministry thus exposed is to be able to hold the rod of dissolution over the constituent body. It is just this power which enables the English Ministry to keep its high character, and the effect of the absence of this power is wretchedly shown in the French Chambers to-day. In the case of the City Council it does not exist.

Another thing to be demonstrated is the effect of such an institution as this Council in running down the quality of public men. It begins with Lord Rosebery, Chairman, and Sir John Lubbock, Deputy Chairman; but where it will end is quite another matter. With the prospect of unlimited talk, the Council has proceeded to "hire a hall," and one member has already called another "no gentleman," while a third has characterized a fourth as a "traitor." And when after some years a pandemonium of extravagance and jobbery breaks out, it cannot even be charged to universal suffrage, because the Council is elected by the rate-payers—a restriction which

many persons here regard as our only hope of salvation.

It is a beautiful saying of La Rochefoucauld that there is something in the misfortunes of our best friends which is not wholly unpleasing to us; and those who enjoy the luxury of lamentation over our own shortcomings, may find fresh stimulus in watching the progress of the English County Councils.

(2.) Among the many wise provisions of the Federal Constitution, not the least is that for a single executive head, with power of appointment of subordinate officials. It was the only way to secure efficiency and responsibility in administration. Congress, however, as soon as it met, proceeded at once, after its kind, to deprive both the President and his Cabinet of all public share in the guidance of policy or legislation, and indeed of influence of any kind, unless exercised like that of any private interest—upon committees through the lobby—and so to paralyze both brain and hand. The result is curiously shown in the speculations of the last three months as to Mr. Harrison's Cabinet. Nobody imagines that it is a question of great national officials who are to exercise an important influence upon the policy or destinies of the country. It is only whether they shall be personal friends or political supporters who contributed to the election, or so selected as to "recognize the claims" of particular States or sections. A Cabinet position, like all our other offices, is not a question of something to do, but of something to get. The Department of State alone excites some intrinsic interest, and that is largely a nervous dread, lest, from its want of public responsibility, it may drag the country into some false position in foreign relations. Just think how different it would be if there was really a question of statesmen; if it was felt that when Congress meets next December, these national officials were to bring forward publicly plans for the management of their several departments, to discuss these plans with individual members in open session, and were held to answer questions and entitled to give opinions as to the details of administration and the effect of laws! Would not the public interest be of a somewhat different kind? G. B.

Boston, March 2, 1889.

THE PROPAGANDA OF FREE TRADE.

To the Editor of The Nation:

Sir: Your correspondents have suggested several ways in which the light of free trade may be let in upon the darkness of protectionist farmers. My experience brings me to the conclusion of Mr. Jessup, who says in his note in the *Nation* of January 31 that the farmer is acted upon by local events and local causes. He does not think beyond them—too often he cannot if he would. If he is born a protectionist, a protectionist he stays. The same may be said, of course, of other classes. I am unable to recall a single person, in a wide and rather varied acquaintance of the past ten years, who has changed his views on the tariff question to any notable extent. Facts are quoted both ways; logic is something in which people do not often indulge, and an appeal to the doctrine of liberty is too abstruse to reach the mind of the average citizen. Among men, almost the only class you may hope to reach are those Mr. Jessup points out as the ones most worth reaching—the editors, advocates, jurists, clergymen, and legislators. And, unhappily, it is well-nigh useless to attempt to recast the material of the minds even of such as these, the most reasonable fraction of our population.

There is a field for missionary work, however, which has long appeared to me the most promising of any the free-trader can enter. I have not seen it mentioned by your correspondents. It is the schools, academies, colleges, seminaries, and universities. To illustrate: The report of the Commissioner of Education shows that there are about 44,000 students in those institutions of our country which are classed as universities and colleges. Next September some 10,000 of these will be entering on the second year of their four years' course. From the catalogues of their respective institutions the names and addresses of these 10,000 can be easily found. From the same catalogues can be learned their ages, approximately, the studies they are occupied with, and the names of the text-books they are using. Can a better point of attack be found? A central propaganda, like the Tariff-Reform League, can mail to these students from time to time a judicious selection of tracts, adapted, as far as may be, to their respective ages, to the character of the institution in which they are enrolled, to the State in which that institution is situated, to the text-books they use, and even to the professors under whom they may suffer. In every institution thus attacked could be found a professor, or at least an enthusiastic student, who would gladly inform the agents of the propaganda as to the better sort of fact and argument and appeal for each particular class, and as to the efficiency in actual practice of the various tracts and publications used. The 10,000 students taken up next September could be followed and beat upon with tracts through the remaining three years of their course. The majority of them will have become voters by November of 1892. They will not count for much in themselves; but if the leaven work to good effect, they will help materially to broaden the foundations of the party of unrestricted commerce. And they, moreover, are the men who will become the editors, advocates, jurists, and clergymen of the next generation. And on them, by following the plan suggested, not a single shot will fall aside of the mark, whether it be effective or not. By this same plan, if it be wished, can be reached, not one, but all, classes in the colleges and universities, and not alone those in the colleges and universities, but also those in every educational institution in the country of sufficient dignity to boast a catalogue.

Not much is to be expected even from this method, which is almost equal to direct personal appeal. It is a lamentable fact that the young academician is not of an inquiring turn of mind. At eighteen the minds of young men are already fast in the cake of custom. I maintain simply that here is a field where the point of attack is well open to view, and where the forces of ignorance and unreason are not yet well marshalled against truth and logic.

It may be a question if money can be obtained to carry on the fight in a quarter whence visible results may for so long fail to appear. But the ardent free-trader is commonly blown upon to an extent—is he not?—by the breath of liberty, and is often in a measure inspired by the idea of humanity. In either case, if he contribute, it is not in the hope of direct financial return.

If I may be allowed one further word, I would suggest that this propaganda of free trade, carried on in the way suggested, could be made to some extent self-supporting. The League can issue a "Library," extend it into other subjects, and obtain from its sale, in time, a partial return for the outlay.

John Cotton Dana.

Three Mile Ranche, Colorado.

A SIGN OF THE TIMES.

To the Editor of The Nation:

Sir: You may be interested in a local illustration of progress made in the popular acceptance of civil-service reform. The present Postmaster here, a Democrat appointed by Mr. Cleveland at the close of the term of his Republican predecessor, is spoken of by leading and strong Republicans as one who, in view of his excellent service, should be allowed to finish the term for which he was appointed; and they have accordingly declined to sign the application of a Republican who is now seeking the office. It is something thus to make good the position assumed by Mr. Cleveland; but something better still is in the air. A very strong Republican tells me that he is ready, if the present Democratic incumbent continues worthy of the office, to solicit signatures to a petition *that he be reappointed for another term!* Verily the political atmosphere is getting purer.—Respectfully yours, H. D. C.

Eastport, Me., March 1, 1889.

PROHIBITION IN NEW HAMPSHIRE.

To the Editor of The Nation:

Sir: For more than a quarter century New Hampshire has had statutory prohibition, and, practically, free rum. In 1887 the Legislature passed an act probably the most direct in process and the easiest in application of any in the United States (N. H. Laws, 1887, chap. 77). It provides, in brief, that every place used for the illegal sale of any intoxicating liquor shall be considered a common nuisance, and that the Supreme Court, or any justice thereof, shall abate such nuisance by injunction on information filed by the Solicitor of the county, or upon petition of not less than twenty legal voters of the town or city in which such nuisance shall exist. To disregard this injunction is, of course, contempt of court, to be punished by fine and imprisonment, at the will of the judge. No jury trial is allowed; not only the seller, but the landlord of the tenement, is liable.

Spasmodic attempts have been made to enforce this incisive law. The failure has been ignominious and almost complete. The liquor-seller carries on his business unfettered; he sells week-days, nights, and Sundays: he sells to old topers and to schoolboys; he pays for no license, and his profits are enormous; not seldom is he counted among the "solid and influential men" in the community. Yet the prohibition sentiment seems to be gaining. The evil is so frightful in both its nature and its extent; its causal connection with nearly all the evils with which organized society has to deal, is so close and so apparent, that even those who hold most strongly to the non-interference theory are coming to regard this traffic as within the legitimate sphere of governmental control. Then why this disgraceful nullification of the most stringent laws? Because our town and municipal affairs are run by the political parties in the interest of the party machines, and not in the interest of the community at large.

The two parties are very closely balanced in the State and equally so in many of the towns and cities. Each party has its rum vote—the Democratic party the larger number, but the Republican too many to dare to enforce prohibition. Thus the rumsellers actually hold the balance of power, and in many cases dictate the policy of the city governments. Consequently our policemen can *see* nothing; our city marshals will *do* nothing; citizens do not enjoy playing informer and detective—it is not

in human nature to do so; the rumseller is our ruler. Is it possible to exaggerate this evil of politics in local affairs? Good citizens who differ on questions of national and State policy are thus made to offset their votes against each other, to the great joy of all the baser elements. For the exquisite pleasure of having a Republican or Democratic (as the case may be) janitor in the city hall, men consent (yes, *vote*) to give the saloon full swing and to see drunkenness and debauchery run riot.

This deplorable condition of affairs might easily be remedied. Let the law-abiding and temperance-loving citizens of each town and city form a non-partisan Citizens' League, not for one year, but as a permanent organization; let each member pledge himself to act and vote in an absolutely non-partisan way in all local affairs. Let this League nominate and elect (for in most of our towns the temperance people are in the large majority) officers who shall understand that the enforcement of the liquor laws is as much a part of their business as the lighting the streets. Let them be as sure of losing their offices if they do *not* enforce these laws as our officers are now if they *do* enforce them; then we can have actual prohibition—never until then!

But what are these select few who arrogate to themselves the exclusive title of "temperance workers" actually doing? Trying to push up into the Constitution the statute law that has been a dead letter these thirty years. They seem to be afflicted with a perfect monomania. The more useless *law* proves, the more loudly do they demand *law*. They fill churches from whose steps one can smell rum, and profoundly assert, "Statutory law is *functional;* constitutional law is *organic;* we must make prohibition one of our organic principles before we can succeed." They denounce as an enemy to all righteousness any one who dares question the advantage of their plan to the temperance cause, or the effect of such a policy on the dignity and authority of our Constitution. Yet, intemperate as they undeniably are, no one can doubt their sincerity or their purity of motive.

This last, however, cannot be said of all the agitators of this movement. The Republican politicians are strongly in favor of it, because they expect thereby to gain to their ranks the third-party prohibitionist votes without losing their own votes. The liquor-seller cares not what laws are *passed* so long as they are not *enforced* by the local authorities; but the third-party prohibitionist has no *raison d'être* after prohibition has become a "part of our organic law." It does not yet appear what action the liquor-sellers will take. The brewers will of course oppose the amendment; but there is no reason why the sellers should not prefer it to a high-license law, and it will not be surprising, after the vote, to find that they have actually favored it. G. W. A.

New Hampshire, February 24, 1889.

RHODE ISLAND IN BRYCE'S 'AMERICAN COMMONWEALTH.'

To the Editor of The Nation:

Sir: Mr. James Bryce has recently published an elaborate work on the American people and their governments, in two large, compactly printed volumes. It has received high commendation from sundry quarters, and deserves all which it receives. It is certainly a wonderful study for a foreigner to make, and yet, possibly, only a foreigner could make such a study. On one of his pages, Mr. Bryce complains of the leniency of criticism in this country. He in fact says that criticism here really does not exist, and that we really need a "searching criticism, which should appraise literary work on sound canons, not caring whether it has been produced in America or in England, by a man or a woman, in the East or in the West," etc. It is to remedy this evil (for I quite agree with Mr. Bryce that we have no criticism), so far as Rhode Island is concerned, that I send this paper. Rhode Island is but a small State, it is true, and Mr. Bryce found little to say specially about her. But there being so little, it is specially desirable that that which is said should be said correctly.

It is stated (vol. i, p. 16) "that all the thirteen colonies owed allegiance to the British crown, and, from them all, causes were carried by appeal from the colonial courts to the English Privy Council." This is qualified in a footnote, thus: "In Rhode Island no appeal seems to have lain to the crown, and the power of legislation was, by the charters of 1643 and 1663, left to the colony, with the proviso only that the laws should be agreeable to those of England as near as may be, considering the nature and constitution of the place." This note is in error. Appeals did lie to the crown, and were often prosecuted there. The celebrated case, Remington vs. Brenton, was an instance, in 1712. A large number of appealed cases could be cited were it necessary. Under a general resolution of the General Assembly, the statutes of England were established as the law of the colony, in addition to its own special enactments, and so they were held for many years; but a decision of the Supreme Court in 1749 overthrew the general resolution, making a specific act necessary to give force to an English statute.

In speaking (vol. i, p. 51) of the duty which devolves upon the President of the United States to maintain a republican form of government in every State, Mr. Bryce cites the case of Rhode Island in 1842. He says: "In the Rhode Island case the President authorized the sending in of the militia of Massachusetts and Connecticut, but the Rhode Island troops succeeded in repressing the rebellion." This is an error. No such proposition was ever even entertained, much less authorized. The President of the United States has no power to order Massachusetts militia to invade Rhode Island.

It is stated (vol. i, p. 547) that "Brown University, formerly called Rhode Island College, founded in 1764, is in the peculiar position of having for its regulation four denominations, Baptists, Congregationalists, Episcopalians, and Quakers, equally represented on the governing body." This is an error. By the Act of Establishment the government of this University was placed in the hands of thirty-six trustees and a Board of (twelve) Fellows. The trustees were to be divided thus: twenty-two Baptists, five Quakers, four Congregationalists, and five Episcopalians. The Board of Fellows was to consist of eight Baptists and four of other denominations.

In speaking (vol. i, p. 533) of the case Trevett vs. Weeden, which seems recently to have come into general notice, Mr. Bryce says, "In 1786 the Supreme Court of Rhode Island decided that an act passed by the Legislature was invalid, because contravening the provisions of the Colonial Charter (which was then still the Constitution of the State), securing to every accused person the benefit of a trial by jury. The Legislature were furious, and proceeded to impeach the judges for disobeying their will. The impeachment failed, but the judges were not reëlected by the Legislature when their terms of office expired at the end of the year, and were replaced by a more subservient bench, which held the statute valid." Again (p. 244), concerning the same matter: "The Supreme Court of Rhode Island held a statute of the Legislature void, on the ground that it made a penalty collectible on summary conviction without trial by jury." And, further, in the same matter, in a footnote on the same page, "See as to this interesting case, the first in which a legislative act was declared unconstitutional for incompatibility with a State constitution, Cooley's 'Constitutional Limitations,' page 106, note."

Mr. Bryce has studied American institutions to small purpose if he has failed to discover that when a properly constituted authority has pronounced an act of a legislature unconstitutional and void, it comes not within the powers of that same judicial authority to reconsider its judgment, and give validity to an act which it has once declared was unconstitutional, and which had never possessed force as law. Hence no "subservient court" could have made a statute valid. However, whatever may be the practice in American courts, this is what Judge Cooley says is the effect of a decision of unconstitutionality:

"When a statute is adjudged to be unconstitutional, it is as if it had never been. Rights cannot be built up under it; contracts which depend upon it for their consideration are void; it constitutes a protection to no one who has acted under it, and no one can be punished for having refused obedience to it before the decision was made. And what is true of an act void *in toto*, is true also as to any part of an act which is found to be unconstitutional, and which consequently is to be regarded as having never, at any time, been possessed of any legal force." ('Constitutional Limitations,' 5th ed., p. 224.)

Mr. Bryce cites Judge Cooley in support of that which he has written. Judge Cooley is an admirable authority. There is probably no man in America whose name would carry greater weight. But possibly Judge Cooley may be in error. On the point above stated, that a court can make valid a statute which itself has before pronounced unconstitutional, Judge Cooley does not, I think, sustain him; but on all the other main points mentioned, I think he does sustain him, for Mr. Bryce has taken many of his sentences almost verbatim from Judge Cooley's note.

This note is in Cooley's 'Constitutional Limitations,' fifth edition, page 194, and Mr. Bryce will, of course, fall back on Judge Cooley as authority; hence I must controvert them both, and this I do. And now, since I can be no more than overthrown, if I am in error, I propose to include Mr. James B. McMaster of Johns Hopkins and Mr. John Fiske of Harvard. All these gentlemen are more or less deeply involved, for they have all fallen into practically the same error. It makes, indeed, a goodly company. In contradiction to all of them, I affirm, that the Supreme Court did not declare the act unconstitutional "because it contravened the Colonial Charter," nor, indeed, "because it made a penalty collectible on summary conviction without trial by jury." The court *did not declare the act unconstitutional at all.* It simply declared that it had no jurisdiction. The record of the case was printed in the Rhode Island 'Acts and Resolves,' October (second session), 1786, page 6, and these are the words of the decision as there recorded: "Whereupon all and singular the Premises being seen, and by the Justices of the Court aforesaid fully understood; it is considered, adjudged, and declared, that the said complaint does not come under the cognizance of the Justices here present, and that the same be and it is hereby dismissed." This is simply a denial of jurisdiction, and was so held by one of the judges, David Howell, Esq., in an argument in defence of the court before the General Assembly. These are his words: "The

Legislature had assumed a fact in their summons to the judges which was not justified or warranted by the record. The plea of the defendant, in a matter of mere surplusage, mentions the Act of the General Assembly as 'unconstitutional and so void,' but the judgment of the Court simply is, 'that the information is not cognizable before them.' Hence it appears that the plea hath been mistaken for the judgment" ('Trial of the Case,' p. 38).

Mr. Bryce makes this statement: "The term of the judges expired at the end of the year, when they were replaced by a more *subservient bench*, which held the statute valid." This is not the precise language of Judge Cooley. He says: "Their terms expired at the end of the year, and (the Legislature) supplanted them by more *pliant tools*, by whose assistance the paper money was forced into circulation." The terms "subservient" bench and "pliant tools" are hardly proper epithets to bestow upon a court before which there came no questions for decision concerning the forcing into circulation of this paper money. The terms of the judges did not expire at the end of the year, unless, indeed, these gentlemen meant to have written "the year *for which they were elected*." But they did not so write; and this expiration has some bearing upon the question. The question before the court was, not whether the General Assembly had a right to legalize the issue of paper money, or to make that paper legal tender. It was the question of imprisonment of men who declined to take the money for goods sold or for debts. The *penal statutes* were called in question. These statutes were enacted in May, June, and August, 1786; and they were all repealed in December of that same year. The court which made the decision was elected in May, 1786, for one year. When their successors were elected, the obnoxious laws had been repealed five months, so that neither a "subservient bench" nor "pliant tools" were required for their enforcement.

The legal-tender aspect of the case is not here considered. It has not been discussed by Mr. Bryce nor by Judge Cooley. The State made paper legal tender in 1786. No Rhode Island court ever sustained the act. The United States made paper legal tender in the time of the Rebellion, and the Supreme Court sustained the constitutionality of the law. If that decision is well founded, I do not see how blame can attach to Rhode Island. But, as I have stated, I do not here enter upon that discussion.

SIDNEY S. RIDER.

73 ALMY ST., PROVIDENCE, R. I.

COMMODORE SLOAT AND THE MEXICAN WAR.

TO THE EDITOR OF THE NATION:

SIR: Apropos of your recent notice of Bancroft's 'California,' your curious readers may find further information about Commodore Sloat's stay on the Mexican Coast, and how he got information of the war, in Dr. Wood's 'Sketches of South America and Polynesia,' published in 1849 by Carey & Hart. Dr. Wood was sent across Mexico from San Blas in order to procure information; his journey was very adventurous and dangerous. In the interior of the country he received the news of war, and sent an express back to Commodore Sloat; this reached him on May 17, 1846, and was the first news to him of the war. The English admiral had previously succeeded in getting intelligence long before our people did, but on this occasion we were ahead: the English were engaged in protecting bullion smugglers. G.

CYCLIST.

TO THE EDITOR OF THE NATION:

SIR:

"The criticule . . . is simply suffering from acute whim, more or less bilious, complicated with defective information, not to speak of an asthenic condition of the logical faculty. To bear him out in his antipathy, almost equally little with the versifier about Dr. Fell does he produce anything that can, even by stretch of courtesy, be complimented as a reason. And now he may be released."

(With apologies to "F. H.," from whose letter on the word "Reliable," immediately preceding that of J. and E. R. Pennell, the above paragraph is appropriated.)

The letter of J. and E. R. Pennell was a source of considerable surprise to me. As an active athlete, I claim some slight acquaintance with athletic nomenclature generally, and out of that knowledge I without hesitation assert that the word "cyclist," be it "English of the poorest kind" or most defensible, is English as spoken in cycling circles; further, I will assert that the word "cycler" is a stranger and only an occasional visitor with us. Not content with my own conviction, I raised the point last night at a large gymnastic club where I am a member, among the members of which we number, I should judge, some 300 to 400 riders. My view was unanimously confirmed by those riders to whom I put the question.

The reference to the proprietor of the *Cyclist* journal as "a small local job-printer and paper-hanger" is hardly ingenuous, to say the least. I have no personal interest in the paper, and, indeed, hardly ever see it, but may say that the proprietor owns two or three other class journals, has an office in London and works in the country, and turns out from the latter, in addition to his own publications, at least one weekly journal with a 30,000 circulation. The composition, presswork, and general handling of such a publication is not usually in the power of "a small local job-printer and paper-hanger." *Verb. sap.*

Yours faithfully, B. J. R.

LONDON, February 18, 1889.

Notes.

SCRIBNER & WELFORD'S spring announcements include Villari's 'Life and Times of Girolamo Savonarola,' translated by his wife, with the author's revision and enlargement; a new and enlarged edition of O'Meara's 'Napoleon at St. Helena'; the works of George Borrow; Select Essays by De Quincey, edited by Prof. David Masson; a new Commentary on Genesis, by Prof. Franz Delitzsch; 'Greek Influence on Christianity' (the Hibbert Lectures); and 'The Dead Leman, and Other Tales from the French,' translated by Andrew Lang and Paul Sylvester.

Bourrienne's 'Memoirs of Napoleon' is to be reprinted from the latest English edition by Chas. Scribner's Sons in four volumes, containing thirty-eight portraits. They have also in preparation a new edition of the Erckmann-Chatrian historical romances, and will publish directly 'Chopin, and Other Musical Essays,' by Henry T. Finck.

J. B. Lippincott Co. have arranged with Boussod, Valadon & Cie. for the exclusive publication in the United States of a sumptuous quarto volume, 'Pierre and Jean,' with illustrations by Ernest Duez and Albert Lynch. The plates will be printed by the French firm, to accompany the English text.

G. P. Putnam's Sons commemorate the approaching centennial anniversary of Washington's inauguration with a unique limited edition of Irving's Life of Washington, in five volumes quarto, comprising 200 illustrations—steel plates, and woodcuts inlaid in the text. Three hundred sets will be printed from type.

A. D. F. Randolph & Co. publish immediately the 'Life of Samuel Wilberforce, Bishop of Oxford and Winchester,' by his son Reginald, revised with additions; the 'Imitation of Christ,' "for the first time faithfully rendered in rhythm"; 'The Spirit of Christ,' by Andrew Murray; 'The Counter-Reformation,' by Adolphus William Ward; and 'Thomas Hard, Priest,' by Barton Lee.

Thomas Whittaker promises directly a collection of twenty new sermons by Archdeacon Farrar.

Lee & Shepard, Boston, have in press 'Decisive Events in American History: Burgoyne's Invasion of 1777,' by Samuel Adams Drake; and 'Every-Day Business: Notes on its Practical Details,' by M. S. Emery.

'Hints for Teachers of Physiology,' by Prof. Henry P. Bowditch, of the Harvard Medical School, will be issued directly by D. C. Heath & Co.

T. Y. Crowell & Co. have just brought out a cheap edition, in paper covers, of Tolstoi's 'Anna Karénina,' in Mr. Dole's version. They have in preparation a translation of W. Heimburg's 'Story of a Clergyman's Daughter,' by Miss Jean W. Wylie.

Mr. Thomas A. Janvier's 'Mexican Guide' for 1889 (Scribners) is the same excellent publication we have had occasion to commend in other years, with few changes beyond those made necessary by the progress of events Some unimportant errors may still be detected, and occasionally a failure to note late changes in Mexican laws—for example, the adjournment of the date fixed for making the metric system compulsory in the country; but none of these at all impair the great practical value to the tourist or intending resident of Mr. Janvier's highly satisfactory work.

The fifth volume of the Transactions of the American Institute of Electrical Engineers (New York, 5 Beekman Street) contains much interesting and valuable matter, and concludes with an index to current electrical literature, or rather a series of monthly indexes, the utility of which would be vastly increased by a general topical index.

A convenient phonographic instructor is afforded by the 'Book of Psalms' "printed in the easy reporting style in accordance with the Manual of Phonography by Benn Pitman and Jerome B. Howard" (Cincinnati: Phonographic Institute).

The latest addition to the series of accurate texts of the Hebrew Bible edited by Seligman Baer and Franz Delitzsch is the Book of Chronicles ('Liber Chronicorum,' Leipzig: Tauchnitz. 1888). The editing is by Baer and the preface by Delitzsch. A second preface, by the latter's distinguished son, Friedrich Delitzsch, consists of a discussion of the etymology of the name of the Assyrian King Tiglath-pileser (Assyrian *Tukulti-pil-ashri*). The conclusion is reached that it means, "My help is the son of the sanctuary."

The *Journal* of the Military Service Institution of the United States will hereafter be published bi-monthly, instead of quarterly, at Governor's Island, New York Harbor.

Mr. F. S. Arnot's modest account of his remarkable journeys in South Africa, given in the February Proceedings of the Royal Geographical Society, are a distinct contribution to geographical knowledge. In the course of seven years he crossed the continent from east to west, and penetrated to regions almost

wholly unknown and unvisited by Europeans, "without a white or even a black companion . . . or show of arms," and "never received any ill-treatment." He succeeded in reaching the country of the Garenganze, at the head waters of the Congo and Zambesi Rivers, the goal of Dr. Livingstone's last journey. Mr. Arnot won the confidence of King Msidi, who appears to be a man of the same stamp as Mtesa, the founder of the kingdom of Uganda. The son of a trader, he has become a powerful sovereign, ruling over a great territory to the west of Lake Nyassa. This he has divided into sections, each governed by a chief who "is represented at court by one of Msidi's wives, by whom all tribute is collected, and all visitors to the capital are entertained." This novel plan, according to Mr. Arnot, who stayed in the country two years, is very effective. In a region lying between this and the Atlantic the natives have succeeded in extracting rubber from the talamba root, which has proved of great commercial value. Mr. Arnot, it should be added, travelled as an independent missionary, and succeeded in establishing a station at Mukurru, the residence of Msidi. An excellent map accompanies this paper, which is followed by an account by Mr. T. F. Bevan of his explorations in British New Guinea.

No. 139 of the *Zeitschrift* of the Berlin Geographical Society is almost wholly given up to proposals for a traveller's outfit in Eastern and Central Africa, by Paul Reichard, freely illustrated. The map of this issue is one helpful in filling out our scanty knowledge of the Amazon Valley; it shows a portion of the Peruvian department.

In the act of taking leave of a so-called winter (we speak for this part of the Atlantic coast), we can enjoy an article on "Der sogenannte Sommer 1888" published in a late number of *Vom Fels zum Meer* (Heft 3, 1888-89. New York: F. W. Christern). The "pious fraud of the almanac" exposed with a light touch, yet with tabular evidence, by Reinhold Kleemann, is, of course, the European "summer" season of last year. "It is a wonder," he says in closing, "that nobody has yet made Krakatoa responsible for it, for such explanations carry weight by their very unintelligibility, and are easy avoidances of confession of ignorance."

The American Society of Naturalists has adopted a report of a committee on the subject of "science in the schools"; recommending that instruction in natural science (chiefly by object lessons) begin in the lowest grade of the primary schools, and be continued thenceforward more and more systematically; that "an elementary (but genuine and practical) acquaintance with some one or more departments"—as, physical geography, phænogamic botany, and human physiology—be made a requisite for admission to college. The report briefly outlines the methods to be employed. The rudiments of human physiology and hygiene, even in the primary school, and of physics and chemistry in the highest grammar-school grades, are likewise urged as desiderata. The Society means to institute a propaganda to this end, and all must wish it success.

A centennial reunion of the alumni and matriculates of the University of North Carolina at Chapel Hill has now become possible, in the lapse of time, and is to take place on June 5 during Commencement week. There will be interesting exercises and class dinners; and a catalogue of all students from the beginning, with a complete history of the University, will be published.

Prof. Crane of Cornell University has been invited by the French Government to act as a member of the Committee under whose auspices is to be held next summer at Paris, in connection with the Exposition, the Folk-Lore Congress (*Congrès des Traditions Populaires*). The Committee is a small one, and is composed of scholars of various nations interested in the study of folk-lore.

—The first place in the March *Scribner's* is naturally assigned to the article of ex-Postmaster-General James on the Railway Mail Service. He sets forth with admirable clearness the growth and working of the system of travelling post-offices, and describes the demoralizing effect of partisan politics upon this branch of the public service with directness and vigor. Under the title "A German Rome," Mr. W. B. Scott writes an historical and antiquarian paper on the city of Treves. The other illustrated article of the number is that of William F. Apthorp on "Some of Wagner's Heroes and Heroines." It is a well-wrought piece of work, aiming mostly to show the ethical and metaphysical ideas which Wagner set himself to elaborate in his creations, with appropriate notice of their origin, growth, and changes, and will, of course, have a great timely interest, in New York at least. A baker's dozen of illustrations show the make-up adopted by some of the most famous Wagner singers in their different impersonations. In "Economy in Intellectual Work," Mr. William H. Burnham gives some old counsels driven home by the latest conclusions of physiological psychology. Mr. Janvier unloads a budget of Mexican popular tales, collected by him in his numerous trips to the neighboring republic; they are of slight texture and interest, though curious enough, some of them. Mr. Higginson and Mrs. Underhill furnish the poetry of the issue, and Henry James what is known as the "end paper." In this case, it is "An Animated Conversation," as Mr. James not too confidently calls it, where the talk flits in and out among the subjects of international relations, modern novels, French and English art, and international copyright, in a way which those accustomed to the author's style can easily imagine; his personal opinions on the topics mentioned will not be hidden from the judicious reader.

—The March *Century*, like most numbers of that magazine, has something to hit every taste. Mediæval art is represented in the paper on the two Gaddis, father and son, with a full-page reproduction of one of the latter's (supposed) works. The modern painters of whom Emma Eames Chase writes are Dutch, and the corners of their studios and other bits of Dutch interiors make pleasing illustrations. To the artistic taste, too, will appeal Mrs. Van Rensselaer's article on York Cathedral, with a dozen different cuts, outside and inside, of the majestic and beautiful pile. Mr. Kennan turns aside for the moment from his study of cruelty to take up that of superstition, and gives an account of an excursion he made off the main route to Siberia in order to visit the Grand Lama of the Trans-Baikal. The principal impression left by the portrait of the Grand Lama, given as the frontispiece of the number, is a growing wonder as to where the man could have stowed away his feet and legs—a wonder that might seem to him as strange as to us seems his at the sphericity of the earth as Mr. Kennan argued it out to him. Something more than an old proverb is illustrated in the careful account of experiments in the use of oil to still the waves of the ocean, and of the devices now employed and proposed to make the remedy more economical and effective, by W. H. Beehler. "Something Electricity is Doing" is more suggestive than descriptive, being made up mostly of hints at the industrial changes to be wrought by "taking the motor to the work instead of the work to the motor." The Lincoln biography reaches the completion of emancipation, up to which it has been working in the recent important chapters. Congressman Reed has a brief protest against the rules of the body in which he sits—not treating the subject with thoroughness, of course, but crying out as one himself in the toils.

—The most taking title in the March *Atlantic's* table of contents (at least for all who are not hopelessly under the spell of Prof. Hardy and Henry James) is "Personal Reminiscences of William H. Seward," by Samuel J. Barrows and his wife, each of whom served as the statesman's private secretary. If what these writers have to say does not fully bear out the expectations roused by their subject, it is only because it should not have been expected that they would have intimate or particularly important revelations to make. A pleasant picture they give us of the Secretary's personal affability, and considerable insight into his habits of composition and methods of work. Stuart F. Weld writes of the Isthmus canal as related to the policy of our Government, his aim being to show that the scheme of exclusive control is decidedly an afterthought, due to the appearance of Jingoism in the State Department in 1881-82. He also points out the changes wrought in international law by the Suez Canal, and argues that the guaranteed neutrality of that highway of commerce is a precedent that ought to be followed in the case of any route across the Panama Isthmus. In "Some Colonial Lawyers and their Work," Frank Gaylord Cook sketches the slow differentiation of the legal profession in colonial times, and dwells at some length on the great political and historical significance of the speeches (rather than strictly legal arguments) of Otis and Henry in the famous writs of assistance and parson's cause cases. John Fiske give more fruits of his historical studies in the Revolutionary period, this time detailing the grand military plan of the English to end the war in its second year, and the parts taken in it by Burgoyne and St. Leger at Ticonderoga, Bennington, and Oriskany. Of course, no one will skip Charles Dudley Warner's short paper on "Simplicity," or Whittier's poem on last year's extraordinary Christmas weather; and those who like a dialect story with something more than the dialect in it will not refuse it at the hands of Elizabeth W. Bellamy.

—The most memorable work of Mr. Halliwell-Phillipps is his 'Outlines.' This opinion of Mr. Furness's expresses the feeling of every true Shaksperian. When outsiders ask, "Why do we know so little about Shakspere?" the best answer is, "Because you have not read, or certainly have not marked and inwardly digested, Phillipps's 'Outlines,' especially the seventh edition." Seeing how all the world has been taxed for elaborating this monumental work, we are at once constrained to echo the saying of Furness, "It is not likely that any scraps of knowledge will be added to what is contained in these volumes." What shall the man do who cometh after the king? But had Phillipps lived a year longer, he would have added a good many such scraps. Witness the growth of the 'Outlines' year by year, even up to the last edition, our presentation copy of which is dated October 3, 1887. In our last conversation with him he said his favorite haunts were the New Record Office and the British Museum, and that he seldom entered either

without gathering up some Shaksperian fragments. He was, in truth, a magnet to such fragments, which attracted them out of hiding-places where no one would ever look for them. "No likelihood of any further scraps of Shaksperian knowledge"! What will Mr. Furness say to the following, which a lucky chance has just thrown in our way?

"In an indenture between the Right Honorable Sir Richard Saltonstall, Knt., Lord Mayor of London, and two other commissioners of her Majesty (fortieth year of Queen Elizabeth), and the parties deputed to collect the first of three subsidies granted by Parliament the year preceding,—bearing date 1 Oct. 1598, for the rate of St. Helen's Parish, Bishopgate ward,—the name of William Shakespeare is found as liable with others to that rate."

This scrap was unknown to Halliwell-Phillipps. He with other prophets and kings desired it long, but died without the sight.

—In the 'Outlines' there is but one statement concerning the local habitation of Shakspere in London. It is in these words: "At this time, 1596, he appears to have been residing when in town in lodgings near the Bear Garden in Southwark" (vol. i, p. 130, 7th ed.). Only this and nothing more. Thanks to the tax-record, we can say where his residence *was*, not merely where it "appears to have been." Mr. Phillipps gives no authority for his opinion concerning Shakspere's lodgings. We have legal proof that his abode two years after was in St. Helen's parish. Crosby Hall in St. Helen's parish is sometimes visited by Americans as the scene of assignation between Gloster (not yet Richard III.) and Lady Anne, and also the place where Catesby was to report to Gloster the progress of the plot for chopping off Hastings's head. It will be visited ten times oftener, thanks to our proof that Shakspere's home was close by that hall, and that, too, about the time, if not at the exact time, when "Richard III." was written. Indeed, the proximity of that Crosby Hall, of Gothic massiveness and oaken ceilings and historic associations, may have led to the selection of Richard as the subject of a play. No trace of the Bear Garden can be discovered. Crosby Hall is the best preserved mediæval building in the metropolis. The scrap we have raked from the dust of old oblivion, if known to Mr. Phillipps, would have become the starting-point of a new departure, "a small prick to a subsequent volume." His research was in many lines, but does not appear to have extended to tax-lists. But, once having caught the scent, he would have ferreted out every document on London taxes in the period of Shakspere's life there. Such a search is the duty of those on whom his mantle has fallen. The worm-hole of long-vanished days from which we plucked this gem we refrain from mentioning, till we learn whether it is known to any writer for *Shakespeariana*. The discoverer of the indenture did not tell anybody of his Kohinoor, but hid it in a place where nobody would look for it. Nor did we look for it, more than Saul looked for a kingdom when he went forth to seek his father's asses.

—The University of Cambridge has lately set up in several of the centres of trade in England examinations for what are called "Commercial Certificates." The first report of the examiners has just been published, and it gives a most depressing view of the state of business education in the country. Forty-nine candidates presented themselves for examination in twenty-three different places, and of these only eight passed. The quality of the papers seems to have been very poor. One question, on commercial terms and abbreviations, was hardly attempted by anybody. No candidate could draw a bill of exchange properly. "Very little power was shown of composing a simple letter in respectable English that should say what was wanted, and nothing more." "The spelling also left much to be desired in some cases, and the writing of a few of the candidates was so slovenly that they would have been rejected whatever the merit of their papers had been." The French and German were both found to be poor; advanced algebra and political economy good for nothing; no practical short-hand; weak geography and history. The English literature was "not of a high order"; the chemistry "inaccurate, and the practical work very poor"; the mechanical drawing "worthless." Even of the arithmetic it is reported that "none of the papers were of conspicuous merit, and the general average was low." Elementary algebra was better done, and some praise is given to single candidates for Spanish, sound and light, and heat and electricity. The English university examiner is not generally believed to err habitually on the side of over-gentleness of speech and judgment, but if the report of the Cambridge examiner is only half fair and just, it explains the preference of business men for German-trained clerks and secretaries, of which some complaint has at times been made in the English newspapers.

—In his address on occasion of the third graduation ceremony of the Imperial University of Japan, the President, Mr. H. Watanabe, presented a concise outline of matters related to that institution which will interest all who note the progress of the higher education in the far East. The College of Law, previously confined to the English and French divisions, has been enriched by the addition of a German division. Instruction in legal court practice is given gratis to students by eminent members of the profession in Tokio. Almost all of the graduates in law will receive appointments in the imperial legal courts. The law college now instructs more than eighty students. The curricula in the College of Medicine are now nearly complete, and include the addition of a new course of pharmacy. Lectures and practical instruction in nursing in the College Hospital were given by Miss Agnes Vetch, a scientifically trained English nurse. Advantages are now to be offered for the study of forensic medicine. Some months ago, on occasion of the visit of her Majesty the Empress to the University and its hospital, she inspected all the wards and operation rooms, and made inquiries as to the diseases of almost every patient. A grant of three hundred *yen* made by her Majesty at that time is devoted to providing extra accommodation for free patients, thus relieving the sick poor, and at the same time offering greater advantages to the course of clinical medicine and surgery. Original investigations conducted in the various institutes of the medical section have been published in the journal of the College.

—Perhaps the outlook of the Engineering College is the most satisfying. The construction of new engineering works and appliances throughout Japan is increasing to such an extent that the graduates of this College are insufficient to meet the demands for properly qualified professional men. Courses in sanitary engineering and the technology of arms and explosives have recently been added to curricula already very full. New buildings in the University compound just completed for the Engineering College are now ready for occupancy. Of the thirty-five graduates of this College, thirteen are in civil engineering, two each in mechanical engineering, naval architecture and electric engineering, one in architecture, eleven in applied chemistry, and four in mining and metallurgy. In the Literature College, only two students graduate, one in philosophy and the other in Japanese literature. In the College of Science many important researches have been carried out. Prof. Knott and his assistants have been busy with a determination of the elements of magnetic force in the empire. For the purpose of anthropological investigations, the *hyaku-ana*, or one hundred excavations, as they are popularly known, have been inquired into, with encouraging results. There were found between two and three hundred of these, and several human relics were obtained—gold rings, swords, old bits of earthen ware, etc. These are in Yoshimi; and elsewhere, many old tombs were searched and valuable archæological specimens procured. In furthering astronomical ends, the Japanese officials have made a wise move in the consolidation of the three Government observatories at Tokio into one. This is known as the Imperial Tokio Observatory, and is attached to the Mombusho, or Department of Education, with Prof. Terao as director. It is thus under the control of the University, and its site is that heretofore known as the Imperial Naval Observatory, in Azabu, whither the instruments and apparatus of the two other former observatories are removed. The principal telescopes are of the best German and English construction. The total number of students of the University, including elective and special students, is now about eight hundred, and more than two hundred scholarships, for the most part on the loan system, are available.

McCULLOCH'S MEN AND MEASURES.

Men and Measures of Half a Century. Sketches and Comments. By Hugh McCulloch, Secretary of the Treasury in the Administrations of Presidents Lincoln, Johnson, and Arthur. Charles Scribner's Sons. 1888.

THE reminiscences of great men are not infallible. "Chief actors" and "principal witnesses" the authors may have been, and still much of their testimony be hearsay, and many of the events which their eyes beheld have been seen through a distorting medium of jealousies, prejudices, unfounded suspicions, and angry, partisan denunciations. The writers were contemporaries, but the writings were not contemporaneous. Except in the case of hastily written, incomplete, imperfect daily journals, reminiscences are written generally long after the events, and by men who know so much about the things they are narrating that they never know when to distrust their memories and "verify their quotations." Thus, General Grant, in his political conversation in 1880 with a Methodist clergyman, said that a certain military order of General Hancock's in New Orleans had been a great mistake—an order which General Hancock should not have issued, and which he, General Grant, had been obliged to rescind. Here the main facts existed: there had been such an order, it had been deemed improper—General Grant had rescinded it; yet the record showed that it had been issued by General Sheridan, and had been rescinded at the request of General Hancock. It is fortunate for General Grant's own book that his military life had been written under his own eye several years before; that it had been subjected to criticism and correction before he himself began to write, and that his own work was subjected to the revision of so well trained a critic as General Badeau.

Mr. McCulloch's events, however, are seen through no distorting medium. A fairer, kindlier book was never written. It is refreshing indeed, in an age of detractious and sensational authorship, to find an able man treating so generously his rivals or opponents, and speaking so temperately of the mistakes and blunders and errors and wrongs which his judgment or his conscience condemns. The fault, indeed, of Mr. McCulloch's book, from a critical point of view, is the abounding kindliness and delicacy which govern his hand whenever he touches his contemporaries, living or dead. For instance, there are many anonymous sayings which would be much more interesting to the reader and valuable to the author if the name of the speaker had been given. Thus: "One of the ablest of the Republican Senators" said, alluding to the sentence in Grant's inaugural that he accepted the responsibilities of the office without fear, "You know, McCulloch, that I am not a religious man, but if I had been elected President I should not have accepted the responsibilities without fear. I should on my knees have asked God to help me." And another unnamed Senator, who viewed the fearful carnage of the Wilderness two days after the battle, exclaimed, "If that scene could have been presented to me before the war, anxious as I was for the preservation of the Union, I should have said, 'The cost is too great; erring sisters, go in peace.'" Both of these speeches reflected upon General Grant, and Mr. McCulloch, scrupulous as to the possible wishes of the speakers, withholds their names.

His appreciation of ability is circumscribed by no clique or faction or party lines, and his good words fall upon the just and the unjust. Of President Johnson he says:

"No public man in the United States has been so imperfectly understood as Andrew Johnson. None has been so difficult to understand. He had many faults, but he abounded also in admirable qualities. His love of the Union was a passion, intensified by the dangers to which it had exposed him and by his labors in its defence." "He was an honest man, and his administration was an honest and clean administration. In this respect it will bear comparison with any that preceded or has followed it. In appointments money was not potent. Offices were not merchandise. The President never permitted himself to be placed under personal obligations to any one. He received no presents. The horses and carriage which were sent to him soon after he became President were promptly returned." "If he did not declare that public offices were public trusts, his actions proved that he so regarded them. In some matters I doubted the correctness of his judgment, but I never doubted his devotion to what he considered his duty to the country, and the whole country." "By the Republican press and by some members of Congress he was denounced as a traitor, not only to his party, but to the country. His services during the war, in recognition of which he had been nominated for the Vice-Presidency; the bravery which he had displayed in his contests with the secessionists of Tennessee; the terrible trials to which his family were subjected by his fidelity to the Union, were all ignored, buried, forgotten."

Of Mr. Stanton:

"He died on the 24th of December, 1869, having made for himself a record for energy, promptness of decision, practicable ability, and inflexible devotion to the Government which entitled him to a very high rank among those who are justly honored for their services when the national life was at stake." "He relinquished a lucrative practice in the legal profession to serve the country when just such services as he was able to render were required, and he did serve it with unfaltering zeal and unremitted industry." "He was a great war minister, and his proper mission ended at the end of the war."

Of Mr. Seward:

"The statesman was much wiser than the soldier [General Grant]." "It was not cowardice, but prudence and intelligent statesmanship, that dictated the policy by adherence to which the French army was forced out of Mexico, Maximilian left to his fate, and the prestige of Napoleon III. severely damaged. Fortunate was it for the people of the United States, and for the cause of civil liberty throughout the world, that at the close of our great civil war the control of the Government was not in the hands of a self-confident soldier."

Of Mr. Chase:

"If I were asked to designate the man whose services, next to Mr. Lincoln's, were of greatest value to the country from March, 1861, to July, 1864, I should unhesitatingly name Salmon P. Chase."

Of Mr. Fessenden:

"He was one of the very few men of his day who merited the name of statesman." "He was not an orator, but a debater of the highest order, lucid, cogent, incisive." "In devotion to what he considered right he was as inflexible as steel."

Of Mr. Seymour:

"Horatio Seymour was one of the ablest and purest of statesmen." "No man in the country was better equipped for the Presidency."

Of Mr. Robeson:

"He was the best abused member of the Cabinet, but the abuse to which he was subjected neither soured his temper nor injured his digestion." "If instead of being Secretary of the Navy, he had been Attorney-General, he would have won an enviable national reputation."

Of Mr. Boutwell:

"He was, I am sure (being, in spite of his prejudices, a high-toned gentleman), gratified as he ascertained from day to day that the Department had been honestly administered."

Of Mr. Belknap:

"He had the reputation of being an able man and of good business qualifications."

Of Mr. Wm. E. Chandler:

"He had my entire confidence—in no one could it have been more safely reposed."

Of President Arthur:

"If any one of our Presidents merited a second term, he did."

Of Mr. Lincoln:

"He was unassuming, patient, hopeful, farseeing. He was also one of the bravest of men. In saying this, I do not refer to personal courage, in which he was by no means deficient, but to bravery of a higher and rarer kind—bravery which was steadfast under the criticism of his friends and the assaults of his enemies." "Throughout his administration Mr. Lincoln was wiser than his assailants, wiser than his friends."

And of Jefferson Davis:

"There have been few men more gifted than Mr. Davis, and few whose opportunities for intellectual culture have been better improved. I had not known him personally, but I knew what his standing was among the able men of the country, and expected to meet in him an accomplished gentleman. To those who knew him well, it is not necessary for me to say that I was not disappointed, and that I was most favorably impressed by his manners and conversation."

As a sagacious reader has remarked, "Mr. McCulloch has said too many good things about too many people." The only person to whom he has not done justice is the late General Rawlins, of whose appointment as Secretary of War he says, "General Rawlins had no special qualifications for the place, and had done nothing to merit the appointment." This was undoubtedly the opinion of many intelligent men at the time; but of General Rawlins, as of Mr. Lincoln, it may be truly said, the more we learn of him the better he appears. Certainly Mr. McCulloch, when he wrote that sentence, could not have read General W. F. Smith's article on Grant and Rawlins, nor the brave and noble letter which the chief of staff wrote to his commanding officer soon after the fall of Vicksburg—a letter which has no equal in the annals of friendship or of military life. Mr. McCulloch says that the success of Vicksburg had a decided influence upon General Grant, and that thereafter he believed in his own destiny. If the truth could be known, it would probably appear that the change was not due to Vicksburg, but to the letter of General Rawlins and the inexorable resolution with which he confronted his superior officer.

Yet it must not be supposed that Mr. McCulloch's courtesy and kindness have made his sketches of men valueless. On the contrary, the man of banks and business frequently dissects character with the hand of a master, and weighs merits and faults in the just and delicate balance which generally belongs only to an experienced critical writer. The analysis of President Johnson and General Grant, the delineations of their characters, the portrayal of their public acts and services, and the statement of their merits and defects, form the best biographical criticism that has yet appeared of those two men. It is not a criticism which the country is yet ready to adopt as to either of them; but when the prejudice and glamour of the day have passed, Mr. McCulloch's estimate will be adopted generally, and the future critic will admire the dispassionate calmness of a contemporary who, notwithstanding the friendly and unfriendly relations which existed between himself and them, was able to look at both sides of each character, and place an almost unerring estimate upon each.

The chief defect of Mr. McCulloch's book is, that, so far as public men and measures are concerned, it is neither reminiscence nor history. When he puts words into the mouth of a general during a battle without citing his authority, it is certain that he did not hear them, and uncertain where he found them. If his book had given only his reflections and observations at the time of the occurrences, it would be a valuable contribution to history, as showing how great events appeared to an unusually calm and intelligent observer, and would help the future historian to see them as they were seen. But, unfortunately, Mr. McCulloch's reflections do not stop there. Nor has he modified the old impressions by careful historical study. Thus, he says of General McClellan, that he "thought at the time that he merited the displeasure of the Government," but that subsequently, after he "had been better informed," his mind underwent a radical change, and he came to the conclusion that instead of having been relieved and retired, he should have been "honored for his generalship and continued in command." Mr. McCulloch also quotes a Confederate general "who served with distinction in the Army of Virginia," as saying, "There was no Union general whom we so much dreaded as McClellan."

Assuredly such statements as these are but a demonstration of the truth of Pope's immortal line. If there was any fact established in the year, 1888, when Mr. McCulloch's book went to press, it was that every Confederate general whose opinion is worth having held McClellan's generalship in unqualified contempt. The audacious movement of Lee *out of the defences* of Richmond, calmly and prudently considered before it was undertaken, was based on his contempt for his opponent's generalship. His operations in Maryland in 1862, the division of his army, the almost reckless advance upon Harper's Ferry, were again based on that contempt. We have also the articles of Generals Longstreet, Hill, and McLaws, and the words of Stonewall Jackson after his capture of Har-

per's Ferry. Even the guerilla Mosby in his book shows that Stuart's raid through McClellan's lines was a product of the same contempt, and he quotes with derision the false and pompous despatch to Washington, saying that some of the enemy's cavalry had gone somewhere, and that he had despatched troops to punish them. If he had telegraphed, "The young and energetic leader of the Confederate cavalry is riding where he pleases through my lines, but I have sent his old father-in-law with cavalry retarded by infantry to catch him if he can," it would have expressed the truth of the situation.

But the error is greater even than this. If Mr. McCulloch had given the world his first impressions and final convictions, and stopped there, no one could have found fault with that. But he then proceeds to give the reasons why injustice was done to McClellan, and why he should have been retained in command—*i. e.*, to write history. The history which he thus writes is nothing more than an abstract of McClellan's oft-repeated complaints and excuses. Of the almost infinite patience of Abraham Lincoln, of the kindly messages he sent to the semi-mutinous general, of the admonitory letters he wrote; of all the reproaches and abuse which were showered upon himself by his own political friends, and what he silently suffered and heroically endured, lest he should injure the cause of his country by mistakenly removing McClellan, Mr. McCulloch manifestly has never heard. The only justification for General McClellan is that which he himself offered at the time, the superior numbers of the enemy. We now know the relative strength of the opposing armies with as much certainty as we know the distance from New York to Liverpool; yet it is manifest that Mr. McCulloch has never seen the figures. Greatly to be regretted it is that so careful and painstaking a man should have published historical statements which were not based on historical research.

But the men and measures of half a century extend before and after the brief period of the civil war. In 1832 Mr. McCulloch listened to Jeremiah Mason as he addressed a committee of the Massachusetts Legislature in favor of a "bill authorizing the construction of a railroad from Boston to Salem"—a measure which was violently opposed, on the ground that a turnpike company was entitled to the exclusive traffic between the two towns. In 1888 he asks, "In what other country do manufacturers who are protected by tariff against foreign competition, combine by trusts and other agencies to prevent domestic competition?" and he comments: "There is no country of which I have any knowledge in which business of all descriptions is so steadily falling into fewer and fewer hands, in which combinations are so powerful, and individuals so powerless, as the United States." In 1833, when he left New England, the *North American Review* had been edited by Alexander and Edward Everett; in 1887 he notices, with the contempt of an upright gentleman, that it publishes the scurrilous trash of an anonymous coward. In his preface, and in the last pages of his book, Mr. McCulloch avows and reavows the conviction that "the greatest mistake which has been made by the Government of the United States has been in conferring upon foreigners the elective franchise," and that "by inviting to our shores to assist in administering the State and national governments men who consider it their duty to fight all governments, we have done much to make our grand experiment a failure."

Besides the men and measures of America, the book contains four chapters upon England, founded, of course, upon the author's six years' residence there. The subject is not a new one, but it is pleasant to have the first impressions of a mature and intelligent American mind, well trained in observation and deduction; and that Mr. McCulloch's certainly was when he first set eyes upon the soil of England. The same discriminating and appreciating spirit is seen in these chapters as in the American portions of the book, and the narration is in the same clear and simple style. An American schoolgirl might read his brief account of English society and life and customs with pleasure and profit, and learn that an English laborer on £1 a week can bring up a family comfortably with enough of food, and meat twice a week, his children in school and something laid by in the savings-bank; that a French village of 300 inhabitants could live well on the food that is wasted in one large American hotel; that a knight will speak of his wife as "my lady," and a duke of his as "my wife"; that London is "the most Sabbath-observing city in the world," and "Victoria one of the purest of women" and "most sensible of queens."

THREE BOOKS OF TRAVEL.

A Trip Round the World in 1887-8. By W. S. Caine, M. P. George Routledge & Sons.

Our Kin Across the Sea. By J. C. Firth, with a preface by J. A. Froude. Longmans, Green & Co. 1888.

Frau Buchholz im Orient. Von Julius Stinde. Berlin: Freund & Jeckel; New York: B. Westermann & Co. 1888. 8vo, pp. 238.

Mr. Caine shows wisdom as well as modesty when he states in his preface that he relies upon illustrations rather than on his literary powers for the success of his book. The illustrations are numerous and admirable almost without exception, and make amends for occasional slip-shod English and other defects of style. But if Mr. Caine is not a great writer, he says much that is interesting, much that is valuable, and he avoids in a most creditable manner the temptation to take the public into his confidence in matters of personal comfort and discomfort—a temptation to which many travellers succumb readily and with much resulting weariness to their readers. The book divides itself into two parts, the first dealing with Canada and the second with Japan, China, and India. Mr. Caine finds much to praise and admire in Canada: the incalculable benefits of a system of free education, not yet reached in England; the fact that an agricultural laborer can go to Manitoba, and in a few years save money enough to buy 160 acres of land, and in a few more years increase his capital ten or twenty-fold; and above all, for Mr. Caine is a strong temperance advocate, the fact that in Canada the cause of temperance is daily gaining ground, and that its inhabitants consume one gallon of liquor per head as compared with ten gallons in England. With all these things he is deeply impressed, as also with the magnificent scenery of the Rocky and Selkirk Ranges, much of which is reproduced in the illustrations, and with the delightful climate of Vancouver's Island, which he considers superior to Manitoba for farming.

Coming next to Japan, he says: "They make a great mistake who think that because Japan is a heathen country, it is, therefore, of necessity low down in the scale of civilization. In everything that makes a country happy, prosperous, and contented, Japan will compare favorably with any nation in Christendom." Mr. Caine thinks that the great Buddhist temples of Nikko rank with the finest religious edifices in the world, pagan or Christian, and that as specimens of carpenter's work they are quite beyond compare. He even goes so far as to declare that the Kutab Minar at Delhi is as beautiful as Giotto's Campanile at Florence. The ill success of missionary effort in the East is illustrated by the fact that after forty years of English government in Hong Kong, there are only 1,200 Christian worshippers out of a population of 160,000 Chinese subjects. This, Mr. Caine argues, is largely the result of the low moral tone of the English governing and mercantile classes. He moreover makes the very serious charge that throughout the East, wherever English influence sways the habits of the natives, intemperance is increasing instead of diminishing.

What strikes him most in India is the disproportionate distribution of wealth—the Rajahs and Princes being enormously rich, and the common people miserably poor, more so even than the inhabitants of southwestern Ireland. The rate of taxation in India is double that existing in England, and the people are constantly on the verge of starvation, owing to the uncertainty of the crops and the extraordinary density of population. Mr. Caine thinks the situation may possibly be improved by the admission of eminent natives to important positions in the Government, and he has hopes that, in view of the growth of manufactures, the time is not far distant when India will produce for herself all that she now buys from Manchester; but many of Mr. Caine's constituents regard India mainly as a dumping-ground for Manchester goods and missionaries, and it is to be feared that his views on these subjects will cause a shudder in Lancashire.

Mr. Firth, we learn from Mr. Froude's preface, is one of the oldest and most distinguished of the New Zealand colonists. He has risen to wealth and influence by steady industry and unblemished integrity. He has never meddled with professional politics, has kept clear of speculation, and attended steadily to his own business. He has been a merchant, has developed mines and railroads, and become a large landowner. In private life he is known as a gentleman and a man of honor. In public he has thrown the weight of his high character always on the side of measures best calculated to further the moral improvement of the population. He earnestly desires to see strengthened the bonds between the mother country and the colonies. Whether the means which he would wish to see adopted are at present available is another question. Mr. Firth has read much, thought and observed more; but he is not a man of letters, and his object is merely to set down in the plainest possible language his own observations and reflections. In the work before us he has described a tour through the United States, and though the subject is not a new one, the treatment of it by a New Zealander is a novelty.

After this flattering introduction by a noted historian, we feel somewhat modest about criticising Mr. Firth's book at all. But candor compels us to state that a large part of Mr. Firth's observations might have been got up with a little research in any good library, and without the expense and trouble of a trip through the United States. In fact, it has become very difficult for anybody not a genius—even a New Zealander—to have new impressions about one of the much-travelled countries of the modern world. With this limitation and restriction, we are quite willing to admit that Mr. Firth's is a readable little book. As to what Mr. Froude

vaguely calls his "economic heresies," they seem to us redeemed by their own vagueness, and his dream of a confederation of the English-speaking race all over the world is perfectly harmless. What we like best in the book is his report about what he actually saw—the behavior of the people in hotels and cars, their manners and traits. Here, as far as he goes, he is on solid ground.

As usual, much of what he says is not particularly flattering to our self-love. One point he notices which we do not remember to have seen treated by any of his predecessors, from Mrs. Trollope to Matthew Arnold—we mean the unwillingness of Americans to say "Thank you" for small services. It certainly is a marked distinction between Americans and English, and it would be interesting to investigate its causes. Is it because most Americans fancy that it puts the thanker in a position of inferiority? Is it owing to a general lack of high civilization and finish of manners? It cannot be for the reason that it is a finer and more democratic thing to be uncivil than to be civil, for what Mr. Firth says on this point is that "Thank you" are words rarely heard in "*this polite and courteous country*, even among equals, for any little service rendered. To inferiors or to servants I do not think I ever heard them applied." Such is one of the traits of the Great West—Mr. Firth does not seem to have travelled in the East—as it strikes a New Zealander.

Stinde's latest work is not a novel or one of the continuations of 'The Buchholz Family,' but merely a narrative of travel in Egypt, Palestine, Greece, and Turkey, ingeniously devised by its thrifty author to derive a little more profit out of the great popularity of his former publications. "Buchholz" has become a valuable trade-mark, to be utilized to its fullest extent. Aside from that, there does not seem any reason why the present volume should have been published. Viewed simply as a book of travels, it is neither better nor worse than the great mass of such writings annually turned out by the mob of tourists who write with ease, and read by nobody knows whom, unless it be the unfortunate critics. It is true, the author occasionally enlivens his narrative with a dash of the peculiar humor to which he owes his fame, and which is for the most part calculated for the latitude of Berlin only. Here and there one even lights on a translatable pleasantry, as when Frau Buchholz, in speaking of the unclouded Egyptian sky, says that it was beautiful clothes-drying weather; but a few such plums are not enough to make the otherwise rather heavy pudding digestible.

Realistic Idealism in Philosophy Itself. By Nathaniel Holmes. 2 vols. Boston: Houghton, Mifflin & Co. 1888.

THE best and shortest criticism that can be made upon these volumes is a comparison of the author's own language upon a theory which he rejects and one which he accepts. There are four theories, he says, which come under consideration: "The Biblical-Supernatural Theory," "The Materialistic-Machine Theory," "The Mystical-Idealistic Theory," and "The Realistic-Ideal Theory." The first three he repudiates; the last he adopts. The theory of materialism he defines and outlines thus:

"Matter has in it the potency of all forms of life. Mind has a physical basis and no other. Thinking is a physiological process, and the work done is measured by the consumption of brain-tissue. Feeling is a state of the nerves. Volition is reflex action, the turning of a balance on its hinge, or the motion of the drop in a spirit level. Memory is residual impression on brain structure, as if imprinted on wax, or is a well-hammered habit of the cell tissues. Consciousness is phosphorescent illumination, as when light glows from an electric candle. Judgment is an overweighing of conflicting brain-states, or of 'relational perceptions.' Reason is only the formal outlines of sense-impressions on the brain-tissue. There is no need of Will or Soul, and no proof of the existence of any: neither microscope nor spectroscope has ever discovered any. Art is a play of brain-tissues into imitations of sense-forms. The ideal is a dream of the fancy. Imagination is a vision-making play of neural states. Emotion is an excited state of the nerves. Morality is the utilitarian result of the mechanical working of the brain: vice and crime are the useless result. Religion is mere superstition: death ends all. Money is the *summum bonum*; but pure devotion to science, that leaves all the profits to patentees and speculators, is highly honorable. Physical science is all the knowledge worth knowing, and is the only redemption from Biblical supernaturalism. All beyond is unknowable and incomprehensible. Positive science is philosophy: all else is either theological vision or metaphysical moonshine."

Whether we agree with these statements or not, they are perfectly clear: there is no mistaking what the author intends the conception of materialism to be. Of his own theory, realistic idealism, he says:

"The theory is founded, as the universe itself eternally is, upon absolute and relative necessities. . . . Its summary category is that of Universality, Specialty, Particularity, and Totality or One-Wholeness. . . . The universal and essential Whole, as absolute Content and Form in eternal movement, is eternally and necessarily differenced, distinguished, and distributed into parts, aspects and special relations within the Whole: and the eternally active and absolute Causality therein involved is eternally and necessarily mediated through these special determinations of essence, form, and relation, as media, means, instrumentalities, and further differentiated into other specialties of essence and form, and into the particular substances, shapes, qualities, and properties of things in Nature; returning again through them and out of them into its own ever-continuous identity, whereby they vanish as such in a perpetual round or cycle of creation of new in the destruction of old. . . . Finite souls, in whatever degree, from the lowest self-conscious animal up to the highest human intelligence, are such specialties of essence and form, of soul and body compounded, in the sphere of external Nature; the internal soul being so specially constituted within the external body as to be in itself a special whole by itself considered, and a *quasi*-logical Notion (however incomplete), and, as such, a partial and dependent (not an absolute) unity or syllogism of synthetic Apperception and Judgment in a finite personality, sharing as such in the universal reason and life by a certain limited participation therein," etc.

The sentence is too long to finish. When giving the views of others the author is brief and sententious enough. It is when expounding his own that he falls into this interminable verbosity. He often has sentences twelve, fifteen, eighteen, or twenty lines long. The definition of the idealistic theory of morals is a sentence of thirty lines. All this reminds us of De Quincey's indictment against Kant: "He has sentences which have been measured by a carpenter, and some of them run two feet eight by six inches." But imagine two volumes of 500 pages each, the most of which is no more intelligible than the last passage we have quoted, much of it worse. The author belongs to that class of men who have rejected mythical Christianity, on the one hand, but have carried over against science, on the other, the hostility which they inherited from theology, and hence, in default of ability to reconstruct their philosophy in terms that would be satisfactory to either theology or science, they run off into parroting the phraseology of post-Kantian transcendentalists—terms that can neither be understood nor refuted. Scarcely anything but the introduction is intelligible. This, being largely an historical survey, is clear and interesting, although in some respects very radical; for instance, when the author would have some Caliph Omar destroy the whole literature of India and Greece as worthless to modern science and modern life. The chapters on evolution show no real appreciation of that doctrine. They practically amount to a complaint that Darwin and his coadjutors do not express themselves in the language of "Essence," "Form," "Power," "Necessity," "Actuality," etc. Evolution would have a different color for him if it could appear in scholastic verbiage. The tendency of the author's mind is very well reflected in the frequent use of such terms as "Quadruplicity," "Triplicity," "Essentity," "Isity," "living syllogism," "unical hyparxes," with a perfectly endless permutation of the charmed abstractions in Hegelianism. If philosophy comes to this, its fate will be pitiful, but deserved.

There is considerable learning in the work, but the author seems to have no sense of what is rational in language or thought, and, apart from occasional passages of an historical nature which reflect a sober judgment, and surprise us all the more at its obliquities when analyzing a problem, the largest portion of it can only be regarded as a specimen of philosophical dementia. It will be of no use to any scholar or student. Unless philosophy can perform its task better, we must give our allegiance to the sciences.

Modern Heliographic Processes: A Manual of Instruction in the Art of Reproducing Drawings, Engravings, Manuscripts, etc., by the Action of Light, etc., etc. By Ernst Lietze. D. Van Nostrand.

THE multiplication of books on photography without the excuse of a new discovery or a new application of an old one is carried to the point of becoming a nuisance, and merits only the most rigorous repression. When a compendium of what is known and to be practised is to be made, it should be done by a thoroughly scientific expert and made as concise as possible, for the practical matter to be taught is not voluminous, and the theoretical too well known to justify repetition by the uneducated.

'Modern Heliographic Processes' does not belong to the class of books that are required or to that of books which are amusing. It is an elaborate collection of all the known processes of reproduction by means of light, and its appellation is no bad indication of the scientific knowledge of the author, for it is a purely gratuitous substitution of the word "heliographic" for what time and general recognition have given the better word "photographic" to. It is an impertinence in this case to attempt to change the vocabulary already accepted. The book in question deals simply with light, and, in the case of almost every process described by the author, the light of a gas flame or an electric discharge has the same power of reproduction; while the term "heliographic" is already appropriated by a well-known process of printing.

The book is a swollen rehash of the most commonplace scientific facts, muddled in the most extraordinary manner, with practical explanations which are curiosities of statement. "The comparatively small susceptibility of the photographic plate to feeble light explains the reason why shadows, in photography [why not heliography?], are generally too dark," is a sample of the nonsense the author talks. The reason why "shadows, in photography, are generally too dark" is simply that the exposure is not long enough. The photographic plate is equally susceptible to any given

amount of light, whether concentrated or feeble, and the actinic force is the same in one case as in another. If an object in shadow has one-sixteenth of the light on it that is on another in sunlight, it will require sixteen times as long an exposure; and when a photograph is too black in the shadows, it is so simply because the exposure was insufficient, and the shadows in the work of a competent photographer are not generally too dark. Then, again, the statement that "the fact that colors exist which we cannot see, but which possess actinic power, and that certain colored rays of light, which possess a great illuminating power, produce but little chemical action, is one reason why photography represents many objects with a wrong distribution of light and shade," shows as complete a misapprehension of scientific relations and language as can be found in any of the blundering effusions of the whole tribe of writers on photography. It must be difficult to determine the character of a color that cannot be seen, but the "invisible red" of which the author talks appears to be definable; though it is not so easy to see what is wrong in the "distribution of light and shade" of the photograph which is due to colors that are invisible. What is alluded to is, of course, the unequal rendering of the values of colors in photography. Not one word of all the labored disquisitions of this book is worth the ink it has taken to print it, and the practical directions are worth much less than those of any good book by a practical printer, because in such works it is not the theory that is wanted, but the consummate experience of men who understand all the difficulties of the beginner. The illustrations are repelling, and recommend neither the operator who made them nor the process by which they were produced.

Life of Heinrich Heine. By William Sharp. [Great Writers Series.] London: Walter Scott; New York: Thos. Whittaker. 1888. 12mo, pp. 211, xvii.

THERE is room for a short English biography of Heine, but the present volume, although purporting to be a "life" of the poet, and nothing else, relegates mere biography to a secondary place, and devotes a disproportionate space to a critical description and estimate of Heine's writings. For such a task the author possesses the one great qualification of being an ardent, though not a blind, admirer of the writings which he has chosen for his theme, and which he seems to have diligently studied. Nevertheless, his criticism does not satisfy the reader, in that it fails to strike the right note with the intuitive precision which distinguishes Matthew Arnold's famous essay, and which atones for inaccuracy in minor details. Mr. Sharp would have made his book better if he had given us more about the poet's life. It was not more abundant in incident than poets' lives are wont to be, but there were enough episodes in his career to furnish forth a volume of such modest proportions as this one is with an interesting and attractive narrative. A useful feature of the book is the appendix of seventeen pages, giving a fairly complete bibliography of Heine's writings, including translations, particularly the English ones, as well as of lives and criticism, whether in books or in periodicals, and concluding with a long list of songs set to music, naming the principal composers in each instance.

YOUNG FOLKS' HISTORY OF

The War for the Union.

By JOHN D. CHAMPLIN, JR.,

Editor of the 'Young Folks' Cyclopædias.' 8vo, illustrated, $2.50.

"It is a book that can be heartily recommended, as designed to meet a real want, and meeting it well. Indeed, the book gives a good deal more than it promises, for it is equally well adapted to general readers who are not young folks. It is, in short, a well-written and entertaining history of the war of the rebellion, very fair and impartial in tone."—*The Nation.*

"Mr. Champlin has made an attractive volume, and has put in the form of a well-told, connected, compact narrative the story of the great civil war. . . . It is written in an entertaining style, calculated to hold the attention of young readers."—*N. Y. Tribune.*

HENRY HOLT & CO.,
PUBLISHERS, N. Y.

Diamond Hams.

For 48 *Years* this brand has given satisfaction for the evenness and richness of its curing. Sold by Leading Grocers, from whom obtain circulars "How to Cook the Diamond Ham."

FRENCH, GERMAN, SPANISH, ITALIAN.

You can, by ten weeks' study, master either of these languages sufficiently for every-day and business conversation, by Dr. RICH. S. ROSENTHAL'S celebrated MEISTERSCHAFT SYSTEM. Terms $5.00 for books of each language, with privilege of answers to all questions, and correction of exercises. Sample copy, Part I, 25 cents. Liberal terms to teachers.
MEISTERSCHAFT PUBLISHING CO., BOSTON, MASS.

The Mother's Register.

*In any family, whether large or small, but es*pecially where the number of children is large, a record of the constitutional peculiarities of each one, and the whole course of its physical development in sickness and in health, is certain to be instructive and may prove invaluable. Such a record is Prof. J. B. Fonssagrives's 'Mother Register,' consisting of a series of tables scientifically arranged for brief and convenient entries. A separate volume for boys and for girls. Price, post-paid, 75 cents per volume, or $1.25 for two volumes.

"By far the most practical record for the period of childhood that I have seen, . . . a separate part being devoted to the girl, in which are points of great importance as references in her after life. The completeness of its items and its convenient arrangement insure the entry of important events."—*C. E. Warren, M. D., in Babyhood.*

For sale at the office of the *Nation.*

*SCHOOL BOOKS IN FOREIGN LAN*guages. Miscellaneous Books in Foreign Languages. Catalogues on application. Foreign Periodicals. CARL SCHOENHOF, Importer, 144 Tremont St., Boston.

Invaluable to those intending to visit the Paris Exposition, and desirous of acquiring, in the shortest possible time, a practical knowledge of colloquial French.

JUST PUBLISHED.

GASTINEAU'S

Conversation Method

FOR

SPEAKING, READING, AND WRITING FRENCH.

By Edmond Gastineau, A.M., Graduate of the Université, Paris, and Principal of the Conversation School, New York.

The method is, so far as possible, that which a person follows in a foreign land when surrounded by those who speak only the French. Complete sentences and perfect idiomatic forms are supplied from the first, coupled with their translation and pronunciation, so that they can be immediately memorized and turned to conversational account.

From the N. Y. Journal of Commerce:

". . . The examples given by M. Gastineau cover all subjects within the probable needs of Americans. Equipped with this volume, and thoroughly familiar with its contents, anybody will be able to get along in a French-speaking country. . . . *The correct pronunciation of every syllable is set forth so clearly that none can mistake it.*

PRICE $2.30.

IVISON, BLAKEMAN & CO.,
753 and 755 Broadway, New York.

St. Jerome.
St. Augustine.
St. Chrysostom.

English Men of Action. Volume 1.

GENERAL GORDON. By

Colonel Sir William Butler. 12mo, cloth limp, 60 cents; cloth, edges uncut, 75 cents.

"Sir William Butler tells the story of Gordon's life as a brother officer should. The interest never flags and the narrative is imbued with a deep feeling of reverence."—*St. James's Gazette.*

"Sir William Butler's 'Charles George Gordon' makes a worthy initial volume to Messrs. Macmillan & Co.'s new series of biographies under the title of 'English Men of Action.' The story of Gordon's life has three conspicuous merits—it is briefly told, it is graphic, and it is discriminating."—*London Daily News.*

The Volumes to follow are:

HENRY THE FIFTH. By the Rev. A. J. Church. *March.*
LIVINGSTONE. By Mr. Thomas Hughes. *April.*
LORD LAWRENCE. By Sir Richard Temple. *May.*
WELLINGTON. By Mr. George Hooper. *June.*

NATURAL INHERITANCE.

By Francis Galton, author of 'English Men of Science; Their Nature and Nurture,' 'Inquiries into Human Faculty and Human Development,' etc., etc. 8vo, $2.50.

STATESMAN'S YEAR-BOOK (THE).

A Statistical and Historical Account of the States of the Civilized World. For the Year 1889. Edited by J. Scott Keltie. Revised after Official Returns. 12mo, $3.00.

"That most useful of all reference annuals. . . . Mr. Keltie has improved this invaluable work, year by year, until now the most critical of critics announces that he can discover no mistakes."—*G. W. S., in New York Tribune.*

History of English Literature. New Volume.

A HISTORY OF EIGHTEENTH CENTURY LITERATURE.

1660–1780. By Edmund Gosse, M.A., Clark Lecturer on English Literature at Trinity College, Cambridge. (Forming the Third Volume of "A History of English Literature.") 12mo, Library Edition, $1.75; Students' Edition, $1.

"In fact, 'Eighteenth Century Literature' is far from being exclusively adapted to students. The criticisms are never tedious or dry, and the short biographies contain interesting personal details of writers some of whom are little known. We shall be surprised if the work is not as popular with the general public as with those who may claim a special knowledge of its subject."—*London Athenæum.*

Price, 15 cents; Annual Subscription, $1.75.

MACMILLAN & CO.,

New York, 112 Fourth Ave.

A FEW MORE FINE BOOKS.

HOGARTH'S WORKS. A collection of the plates engraved by and after this great English master, ORIGINAL IMPRESSIONS, arranged in the same order as Boydell's edition of 1790, the title-page of which edition has been bound up with them. *In some instances duplicate impressions of the plates, sometimes in a different state of the plate, sometimes a restrike, and sometimes plates by different engravers, such as the small series of the "Harlot's Progress" by King, and the* MAGNIFICENT SERIES OF 6 MEZZOTINTS OF THE "MARRIAGE À LA MODE," BY EARLDOM, *and the Mezzotint of "Sigismunda," by Dunkarton, have been added. In addition to the 108 plates called for in the list of plates given by Boydell a few extra ones have been included, and among them the two suppressed ones "Before" and "After."* In all, 166 prints, neatly inlaid in drawing paper (a few mounted), and bound in two vols., atlas folio, russia super-extra, gilt edges. London, 1735, etc., $500.00.

This collection has been made up of FINE CLEAN COPIES. The highest expert authority in America says of it: "I have examined your copy of Hogarth very carefully. It is a very fine collection of his works. The plates are not only original impressions, but are fine early ones, and the collection is one of the finest I have seen."

LORD CAMPBELL'S LIVES, as follows: LIVES OF THE LORD CHANCELLORS, 7 vols.; LIVES OF LORDS LYNDHURST AND BROUGHAM, 1 vol.; LIVES OF THE CHIEF JUSTICES, 3 vols. Together, 11 vols., 8vo, ILLUSTRATED BY THE INSERTION OF 319 FINE AND RARE PORTRAITS AND PLATES, *representing the leading personages and places mentioned in the volumes*, newly and handsomely bound in yellow polished calf extra, gilt edges. London, 1846, etc. Unique and most interesting copy of the large-type edition. $250.00.

MÉMOIRES DU COMTE DE GRAMMONT, par le C. Antoine Hamilton. *Ornée de 72 portraits.* Royal 4to, russia super-extra, sprinkled edges. Londres, chez Edwards (1793). $50.00.

The portraits are finely engraved by Harding, and consist of 76, instead of 72 as stated on the title. In addition, 5 scarce portraits have been inserted, making 81 portraits in all.

MEMOIRS OF COUNT GRAMMONT, by Count A. Hamilton. A new translation, *embellished with 76 portraits finely engraved by Harding.* Royal 4to, finely bound in red grained morocco extra, gilt edges. London, Harding (1793). $150.00.

Published at the same time as the foregoing edition in French, and containing the same plates. This copy has the PORTRAITS BY HARDING HAND COLORED IN A WONDROUSLY BEAUTIFUL MANNER. But very few were made with the portraits colored.

THACKERAY'S NOVELS, comprising: VANITY FAIR, 1 vol.; PENDENNIS, 2 vols.; NEWCOMES, 2 vols.; and VIRGINIANS, 2 vols. Together, 7 vols., 8vo, *with numerous illustrations by the Author and Richard Doyle*, yellow polished calf extra, marbled edges. London, 1848–58. $75.00.

Complete set of the volumes issued in octavo, all FIRST EDITIONS.

SHAKESPEARE SOCIETY'S PUBLICATIONS; consisting of Works illustrative of Shakespeare, Old Plays, Poems, Curious Tracts, Memoirs, etc., either now printed for the first time or from their rarity difficult to be procured. Complete set, from its commencement, 1841, to its termination in 1853. 47 parts in 19 vols., 8vo, antique half calf, red tops, contents lettered. London, 1841–53, $90.00.

Among the distinguished editors of this publication were J. P. Collier, J. O. Halliwell, and Rev. A. Dyce.

DE FOE'S ROBINSON CRUSOE, Cadell's large-type edition, *with 22 engravings by Heath after* STOTHARD'S CHARMING AND CELEBRATED DESIGNS. 2 vols., royal octavo, yellow polished calf extra, gilt edges, the binding in new and fresh condition. London, 1820. $32.00.

From the library of JOHN FORSTER, author of 'Life of Dickens,' 'Life of Goldsmith,' etc., etc., with his Book-plates.

HIGDEN'S POLYCRONYCON. [Colophon]: Imprented in Southwerke by my Peter Treveris at ye expences of John Reynes boke seller at the sygne of saynte George in Poules chyrchyarde. The yere of our lorde god 1537, the xvi daye of Maye. BLACK LETTER, *with woodcuts*, folio, neatly bound in calf. $190.00.

Fine copy, tall and clean. *Collation:* rubricated title, with a large woodcut of St. George and the Dragon; also "an Introductorie Anno Domini 1492," 1 leaf; proheme and table, 49 leaves, folio ccclxvi; and a leaf at end containing imprint and a large woodcut of St. George and the Dragon.

The above, together with a very large stock of rare and valuable imported books, are for sale by

A. C. McClurg & Co.,

117, 119, 121 Wabash Ave., Chicago.

Premiums on Policies not marked off 1st January, 1888.....		1,388,238 01
Total Marine Premiums.....		$5,253,404 39
Premiums marked off from 1st January, 1888, to 31st December, 1888.....		$3,867,269 52
Losses paid during the same period.....	$1,998,897 36	
Returns of Premiums and Expenses.....	687,287 98	

The Company has the following Assets, viz.:	
United States and State of New York Stock, City, Bank, and other Stocks....	$7,501,315 00
Loans, secured by Stocks and otherwise..	2,469,000 00
Real Estate and Claims due the Company, estimated at.....	569,947 20
Premium Notes and Bills Receivable....	1,374,912 12
Cash in Bank.....	252,812 02
Amount.....	$12,167,986 34

Six per cent. interest on the outstanding certificates of profits will be paid to the holders thereof or their legal representatives on and after Tuesday, the fifth of February next.

The outstanding certificates of the issue of 1884 will be redeemed and paid to the holders thereof, or their legal representatives, on and after Tuesday, the fifth of February next, from which date all interest thereon will cease. The certificates to be produced at the time of payment and cancelled.

A dividend of FORTY PER CENT. is declared on the net earned premiums of the Company for the year ending December 31, 1888, for which certificates will be issued on and after Tuesday, the seventh of May next.

By order of the Board,
J. H. CHAPMAN, Secretary.

TRUSTEES.

The Nation.

NEW YORK, THURSDAY, MARCH 14, 1889.

The Week.

THERE has been nothing revealed since the Republicans "returned to their own" in Washington which has so disgusted them as the discovery that there were, in the departments and elsewhere in the public service, many Republicans who had remained in office throughout the Cleveland Administration. How to get these men out and secure their places for a few thousand of hungry office-seekers, immediately became a pressing question. A solution appears to have been found, and it was very appropriately announced in the *Tribune* of Monday, under the guise of a Washington despatch. It is that the "holdovers" retained their places "usually by playing the rôle of 'informer' against their former official superiors and professing to be ardent Democrats," and consequently they are now to be found "among the men whose anxious faces haunt the hotel corridors." It is intimated that the President will make short work with them. Why make so much of a pretence as this for getting them out? Why not take the bold ground, frequently taken by Republican statesmen, that no Republican of self-respect would ever consent to hold office under a Democratic Administration, and any Republican who did consent is *prima facie* unfit for his place? That is much the easier way out of the difficulty.

The Cleveland *Leader* has an important communication from Washington touching President Harrison's intentions regarding the Civil-Service Law and the rules and regulations now in force. Shortly before the expiration of his term, President Cleveland extended the provisions of the law to the railway postal service. Some doubt as to the validity of this action has been entertained because, at the time the order was made, the Civil-Service Commission was in a disorganized state. An examination of the law will serve to remove this misapprehension. The Civil-Service Commissioners do nothing to give validity to the President's action. What they have to do is to "aid the President as he may request in preparing suitable rules for carrying the act into effect." The President may act without such aid if he chooses to do so. He may ask the assistance of private persons, or he may proceed without assistance from anybody. All that is incumbent upon him in order to give validity to the step is to "promulgate" it. The act of promulgating is simply the filing of the order in the State Department. It then becomes a public document, like a proclamation, or a statute, or a treaty. This mode of procedure was followed by Mr. Cleveland in extending the civil-service rules to the railway postal service, but by a clerical error the time named for the order to take effect was March 15 instead of February 15. The error is not very important, since the President of the United States for the time being is empowered to make modifications of the rules at any time, whether these rules were made by himself or by any of his predecessors in office.

The despatch to the Cleveland *Leader*, which seems to be stamped with authority, says that President Harrison has declared his intention not to revoke the order, but to modify it, so that it shall take effect June 15 instead of March 15, and so that dismissed employees may be reinstated without reference to the time of their dismissal. The order, as it now stands, says that a dismissed employee may be restored within one year. President Harrison intends to strike out the words "within one year." The effect of the two modifications will be to give opportunity until June 15 to restore any employees who were dismissed under the Cleveland Administration, and to fill any or all positions in the service in the old way, instead of by competitive examination. Civil-service reformers would, of course, prefer that the extension of the rules made by President Cleveland should stand. Removals and changes were made in the railway postal service under his Administration that ought not to have been made; but since two wrongs do not make a right, it would be much better that the *status quo* should be respected in so far as the railway postal service is now well conducted, and that when it is not well conducted the places should be filled not by personal favor and political chicane, but by ascertained merit. The Civil-Service Law, it should be observed, does not prevent the President from *removing* any employee. It merely regulates the mode of filling the vacancy caused by the removal. The modifications made or to be made by President Harrison, therefore, simply open the door until June 15 for filling vacancies in the old way. We shall not attempt to criticise the President's action in the premises until we see in what manner he uses the liberty which he gives himself.

The Kansas Legislature adjourned on Monday. At the exact moment of President Harrison's inauguration, the House, after singing "Praise God from whom all blessings flow," adopted a resolution "that we congratulate the nation upon the incoming at this moment of a Republican Administration, and a consequent era of prosperity and good government." On Tuesday occurred the failure of the Reading Iron Works, with liabilities of nearly $2,000,000, throwing 2,000 men out of employment. On Wednesday came the failure of the Excelsior Pottery at Trenton, N. J., employing 300 hands. On Thursday the Keystone Rolling-Mill of Reading, and the rolling-mills at Naomi and Gibraltar, Penn., shut down, throwing altogether over 600 men out of employment. On Friday the Findlay (Ohio) Iron and Steel Company, with the principal rolling-mill in that manufacturing centre, made an assignment, with liabilities of over $100,000. We wonder what the protectionist newspapers and politicians would have said to these happenings if Mr. Cleveland had been re-elected. Would not the air have resounded with cries against tariff reform and all its disciples and advocates? We can scarcely imagine a more favorable basis for denunciation of the Cobden Club, the London *Times* and *Spectator* and *Iron Era*, and all the imaginary and forged extracts from the British press.

These failures are not chargeable to tariff reduction either actual or threatened. The Reading Iron Works were engaged principally in making wrought-iron tubes upon which there is a duty of 2¼ and 3 cents per pound, equal to 71 per cent. ad valorem. That this duty is virtually prohibitory, is manifest from the fact that the total importations for the year 1887 were only $116,000 worth. It is worth remark that this is the second failure of this great tube manufactory, the first having occurred in 1881, when the duty on their product was 3½ cents per pound on all kinds of wrought tubes. On the occasion of the first failure, the creditors were compelled to take preferred stock in the reorganized company for their claims. This is now wiped out, together with the original capital, for, although there is an apparent excess of assets over liabilities, it is not likely that the sale of a plant which showed a deficit of $87,000 in one year's operations would realize anything near the sum at which it stands in the company's balance sheet.

Gov. Hill's share in the abominations of the ceiling job were dimly discerned in Saturday's developments of the Assembly inquiry. Mr. Andrews, the janitor whom the "dealers" put in charge of the work, testified that he made a contribution of $1,000 to the Democratic State Campaign Committee, $500 of which he deducted from the $3,500 of extra compensation which the Ceiling Committee, in violation of the Constitution, awarded him, and the remainder he collected from persons "around the Capitol." Mr. Andrews was a Hill Democrat, and had been put in charge of the ceiling job by Republicans. If Andrews gave this large proportion from his illegal salary, how much did the contractor give of his $100,000 illegal profits on the job? In making this contribution to the campaign fund, and by collecting other moneys to go with it, Andrews violated the Civil-Service Law, and should be removed at once for that offence. It should be borne in mind

that the power to remove him lies in the Trustees of Public Buildings, who are the Governor, the Lieutenant-Governor, and the Speaker of the Assembly. When Mr. Andrews confessed at the first investigation that he was incompetent and had grossly neglected his duties, the Assembly formally demanded his removal. Was the demand granted? Not by any means. The trustees obtained an opinion from the Attorney-General to the effect that they had not the power to suspend him while under fire. Will they remove him now in face of his own confession that he has violated the Civil-Service Law? Let us see. They can possibly obtain from the Attorney-General an "opinion" which will help them to protect him a little longer. Let it be remembered that the Speaker is also the Chairman of the Ceiling Committee, which preferred Andrews to Perry for the work, and that it was the Ceiling Committee, a majority of whom were Republicans, who voted to Andrews the $3,500 of illegal compensation from which he gave $500 to the Hill campaign fund. The truth of Mr. Ainsworth's declaration that the ceiling job elected Hill and Harrison, becomes more and more clear.

The cordial welcome which Mr. Cleveland is meeting from all classes and conditions of people in this city, makes the virulence with which he has been pursued down to this moment by a portion of the Republican press difficult to explain, as it is almost unprecedented to follow a retiring President into private life with vulgar abuse and ridicule. But, when one reflects on it, it is a very natural outcome of the spirit which the high-tariff men carry into all discussions affecting the tariff. An attack on the tariff is to them an attack on their property, and there is nothing which makes men so vindictive as an attempt to take property from them. In their eyes Mr. Cleveland, in getting hold of the Presidency and keeping the Republican party out of power for four years, really took money out of their pockets, and by his tariff message he began a movement which they fear will end in taking more. They therefore both hate and fear him, and consider any weapon lawful against him—including blackguard stories about his private life. One other thing in his career is gall and wormwood to them, and that is, that he is the first President since Lincoln who quitted the White House without leaving behind a single scandalous memory. No jobbery or fraud has been traced to the White House, or in its direction, while he occupied it. His friends have never had to apologize for or explain charges of self-seeking at the public expense, or the payment of personal obligations out of the public treasury; therefore, to his enemies he will probably remain a thorn in their side and a possible danger as long as he is alive and well.

The sudden and summary removal of Mr. Perry Belmont, our Minister to Spain, from the position which he has held only three or four months, emphasizes the personal pique of Mr. Blaine towards the member of the House Committee on Foreign Affairs who probed his Chilian-Peruvian diplomacy in the year 1881 to the extent of torture. In point of fact, Mr. Belmont fastened an untruth upon Mr. Blaine in that affair, and this ruthless act led the ex-Secretary to characterize Mr. Belmont as "no gentleman." Of course Mr. Belmont would expect to be recalled by the present Administration, but a mere recall would not serve Mr. Blaine's turn. His recall must needs be the first official act of the new Secretary. Nobody can doubt now, if anybody doubted before, that Mr. Belmont's probe produced a lasting sore.

Indiana has the honor of being the second State in the Union to enact a complete ballot-reform law. The Andrews bill, based upon the Australian method, has passed both houses of the Legislature, and has been signed by the Governor. It is a very voluminous law, containing many features of the Massachusetts law, and is as complete an application of the Australian system to American methods as has been formulated in any part of the country. It provides for the printing and distributing of all ballots by the State, for independent nominations by means of nomination papers, for an absolutely secret ballot, and for the use of no ballots save those supplied by the State. There is no State in the Union more in need of such a law, for there is none in which there has been more corruption at the polls. Under the new provisions, Dudley "floaters in blocks of five" cannot be followed to the polls to see if they vote as they have been bribed—an obstacle to Dudley's usefulness as a power which may drive him out of politics. It should be added, for the edification of New York Democrats, that the Indiana Legislature is strongly Democratic in both branches.

A rude sort of educational test for the suffrage has just been established in North Carolina, by the passage through the Legislature of a bill providing that all ballot-boxes shall be labelled, and that voters shall approach the polls one at a time, and place their several ballots in the proper boxes, none to be counted which get into the wrong boxes. The theory of this law is eminently sound; it is nothing else than the traditional New England idea, that no man should be allowed to vote unless he can read. The North Carolina statute, if adopted in Massachusetts, would not deprive of the suffrage a single man who now enjoys it, because no man can enjoy the suffrage in Massachusetts who cannot read the State Constitution—and so, of course, the labels on ballot-boxes. North Carolina has just as much right to establish an educational test for the suffrage as Massachusetts, and Massachusetts holds it unsafe for herself to allow any man in the State to cast a ballot who cannot pass an educational test. In like manner, Massachusetts men—even so intense a partisan as Mr. George F. Hoar—have always held, even when such a stand seemed against the advantage of their party, as was the case fifteen years ago, that no Territory like New Mexico should be admitted into the Union as a State where the census showed that a majority of the men could not pass an educational test, and consequently were unfitted, according to the traditional New England idea, to govern themselves and share in the government of the nation.

The danger about such a law as the new one in North Carolina is, that it will not be enforced impartially. It is charged that in South Carolina, where a similar system has been in operation for some years, illiterate whites are "steered" by the Democratic managers to the right ballot-boxes, so that their votes do not have to be cast out, while ignorant negroes are afforded no help, and stand six chances to one of making a mistake and thus practically losing the suffrage. In North Carolina, when the last census was taken, 23 out of every 100 white males above the age of twenty-one, and 76 out of every 100 colored males, were returned as unable to write, the percentage who were unable to read being slightly less for each race. A fair enforcement of the box law would thus debar from voting about one-fifth of the whites and more than three-fifths of the blacks, and it would be as greatly to the advantage of all the people in North Carolina if all such illiterates should impartially be denied the suffrage, as it is for the advantage of Massachusetts to deny all such illiterates a share in its government. The danger is that, where the whites control the election machinery, they will discriminate against the blacks. This danger always applies to any test for the suffrage. Apparently well authenticated complaints were made to us last fall that a judge of the United States District Court in New England, who is a strong Republican, discriminated against the Democratic party in the naturalization of foreigners, allowing anybody who was vouched for by a good Republican to slip through, while "holding up" a good many protégés of Democratic managers, who were equally deserving. The public opinion of the community is the only safe reliance for the overcoming of difficulties of this sort. A breaking down of old party lines on the race issue is impending throughout the South, and if the white Democrats in any county fail to enforce the new law impartially, an opposition party, led by whites, who can command a hearing, will be developed, which will secure fair play. Fortunately, with the steady extension of the school system, the number of voters of each race who cannot read the labels on the ballot-boxes will diminish steadily year by year.

The lower house of the Rhode Island Legislature has passed, by a vote of 41 to 25, a resolution to submit the question of repealing the present Prohibitory Liquor Law to a vote of the people. This large majority in favor of resubmission is strong evidence of the con-

dition of public opinion in the State concerning the law. There is no doubt that in the cities of the State the law is so complete a failure that a very large majority of the electors will favor its repeal, and it is believed that, if the Senate concurs with the House, as is probable, there will be a popular majority in the State against the law.

An interesting symposium upon the question of constitutional prohibition for Massachusetts has been published by the Cambridge *Tribune*, in which such high authorities as Prof. James B. Thayer, Col. T. W. Higginson, R. H. Dana, and William E. Russell take part. These gentlemen, who easily carry off the honors in the discussion, all unite in opposing the proposition for a prohibitory amendment. Their views are especially noteworthy, as nearly or quite all of them are supporters of the prohibitory law, which, our readers are aware, is being enforced with such signal success in Cambridge. Prof. Thayer is, in fact, the President of the Cambridge Association for the enforcement of the law, and has, he says, voted three times for prohibition in local elections. He says he is opposed to constitutional prohibition for three reasons, first, because it is a misuse of the Constitution; second, because "it is not the time to do the thing even if it should ever be done"; and third, because "prohibition in any form, except as a local and temporary policy, as a feeling of the way to something better, is but a poor mode of dealing with the liquor question." Col. Higginson says he shall vote against the amendment, although rather unwillingly, because it does not seem to him the best way of reaching the evil, adding: "Our present Local-Option Law appears to me far better, because, by the local agitation it affords, it educates the particular community which has got to enforce the law—that is, the town or city, as the case may be." Similar reasons are given by Messrs. Dana and Russell.

The Weldon Canadian Extradition Bill, which authorizes Canada to surrender to us fugitives from justice with or without an extradition treaty, is a new departure in modern international conduct. Treaties of extradition, as we now know them, with all their elaborate machinery, judicial and executive, are comparatively new contrivances. So late as 1827 the Provincial Court of Appeals for Lower Canada held that a fugitive accused of larceny in Vermont, and escaping across the border, could be surrendered without regard to the absence of a treaty covering the offence. But thirty-five years afterwards Lord Denman said in the British House of Lords that all Westminster Hall and the judicial bench agreed that, in England, there was no right of arrest or surrender of a fugitive from the justice of a foreign State, unless a treaty required it. Such limitations on the judicial power have not always been recognized in England. There are cases in the reports of Vesey and Taunton in which the judges said the Government might send a prisoner to answer for a crime wherever committed. The power was recognized under the common law and under international law. But while, in modern times, England has said she would not surrender fugitives unless there be a treaty and a law authorizing and requiring, she asked Spain, in 1874, to surrender to her Bidwell, the bank forger, and Spain made the surrender, even although no treaty required it, just as she arrested and surrendered Tweed to us when no extradition treaty existed. And so, the other day, Spain arrested Pigott on a telegraphic message, and before formal papers had been received at Madrid. Spain proceeds on the rules of courtesy and comity which prevailed in the olden times in Europe, when sovereigns deemed themselves, in such matters, members of one family, and a request of that character was promptly complied with without a treaty and without judicial intervention. The surrender of Arguelles to Spain in 1864 by order of Seward is the only exception to the American rule prevailing from the foundation of our Government, that the President cannot arrest and surrender, in the absence of a treaty, or a law authorizing and requiring. Seward justified the arrest and surrender of Arguelles on the plea that they were in pursuance of the law of nations, which is by our Constitution made a part of our Federal law, which international law the President is bound to execute as a part of the Constitution.

The Copper Syndicate, notwithstanding the alleged contract made with the large American mining companies to restrict production, appears to be still "in the trough of the sea," now up and now down, one day sailing fairly well and the next day on beam-ends. A telegram from Paris says that the Syndicate received from the mines in the month of February 10,000 tons, and sold only 1,397 tons. At this rate even the Bank of France would be ruined in the end. Such an output of metal calls for more than $2,000,000 per month to be absolutely locked up, and the interest on it lost, unless it can be recovered at the end of a doubtful speculation. No wonder that the depositors in the Comptoir d'Escompte made a rush for their money when the fact became known that M. Roschereau had lent $6,000,000 of its funds to the Syndicate, and then shot himself through the head. Probably this institution will be helped through the crisis by the other banks, which have had no share in the copper speculation, but probably the credit of the Syndicate will be so tremendously shaken that it can get no more advances on its growing load of copper. It is for the public interest that the Société des Métaux should go under at an early date. If it should succeed in permanently cornering the world's supply of copper, there would be monopolies, or attempted monopolies, in lead, tin, zinc, sugar, tea, coffee, wheat, cotton, and every staple article, on a world-wide scale, and human society would be divided into two classes, cornerers and cornered.

France has now got back the "scrutin d'arrondissement," or district-ticket system, which is relied on by the Republicans to save the Government from the Boulangists. The law was passed by both Chamber and Senate on the 13th ultimo, and the next elections will be held under it. Every district is to elect at least one deputy; and any district having more than 100,000 of population, one deputy in addition for any fraction of 100,000 over the first. The only effect of this will be to prevent Boulangists from getting majorities in whole departments at elections held to fill one vacancy. It will not change in any marked degree the character of the Deputies, which is the source of all the trouble. It has been ascertained by actual experiment that the two kinds of tickets send up exactly the same kind of representative. The Republic is now seeking refuge in the *scrutin d'arrondissement* from exactly the same evils from which it sought refuge under Gambetta in the *scrutin de liste*, or general ticket. The only remedy which has not been tried is a recast of the national character. The Republicans in the Chamber, who overturn ministries once a month to gratify individual spites or disappointments, are bad enough; but are they as bad as the Royalists, who pretend to greater enlightenment, but do not hesitate, whenever the opportunity offers, to vote in any way that will ruin the only government France has, damage the national credit, and precipitate a revolution of which nobody pretends to foresee the outcome?

The abdication of King Milan of Servia, if it has any political importance at all, will simply result in throwing the kingdom more completely than ever under Austrian domination—an almost necessary consequence of a regency which must last eight years, if the heir to the throne lives so long. Party spirit in Servia runs very high, and politics are still in the primitive stage in which statesmen are accused of plotting the assassination of their rivals. This state of things was of course aggravated by the King's mental condition, which for a good while has bordered on lunacy. During the past year he has been kept in continual excitement by his desire to get rid of his wife, by his fear of the Radicals, and by the manufacture, under his personal supervision, of a new Constitution. The Constitution had just been drafted by the Commission of Revision when he made up his mind, or what passed for his mind, to abandon the throne. The Constitution is to be laid before an extraordinary meeting of the Skupshtina to be elected in September next, and to sit in October. Our readers have already been acquainted with its general character. What will become of it now it would be hard to say. That will probably depend on the view taken of it in Vienna.

THE PARTY THINKERS.

All accounts from Washington agree that the pressure for offices was never so great as now. The *Tribune* calls it "tremendous." All the great improvements in communication, by land and sea, including the lowering of railroad and steamboat fares, and the extension of the telegraphic system, and the reduction in letter postage, and the rapid growth in population, combine to make the crowd of office-seekers in Washington greater than it ever was before. Senator Manderson of Nebraska says the list of applicants from that State would be "a directory of the State." Senator Ingalls says that all the offices in the gift of the Administration would be insufficient to satisfy the demands of the candidates from Kansas. There is probably hardly a Republican State west of the Alleghanies of which the same story might not be told. The rush of the "place-hunters," which is the very appropriate old English name for them, is almost like the march of the Barbarians on Rome.

How President Harrison will stand it, remains to be seen, particularly as the office-seeking pressure is accompanied with endless handshaking with men who come "to pay their respects." Should the infliction grow with the population, the time cannot be far distant when the physical powers of the President will be the chief consideration in making the nomination, and when the successful candidate will have to go into training, as for a prize-fight or boat-race, between the first Tuesday in November and the 4th of March.

The President has thus far only made his peace with a few of the men of action of the party—that is, the men who raised money for the canvass, or took charge of its distribution, or constructed and carried through the various "deals" to which the success of the Republican ticket was due in some places. He has still to enter on the far more difficult task of rewarding the thinkers of the party—that is, the men who explained its policy and aims to the ministers, and the deacons, and the Sunday-school teachers, and the editors of the religious newspapers. This is a large and not easily satisfied body. It includes such men as Col. Elliott F. Shepard, the Hon. Whitelaw Reid, the Hon. Murat Halstead of the Cincinnati *Commercial Gazette*, the Hon. Charles Emory Smith of the Philadelphia *Press*, Prof. Charles E. Fitch, Professor of Journalism in Cornell University, and the Hon. Thorndike Rice of the *North American Review*. We cannot recall at this moment any party which has commanded the service of so much talent of the intellectual sort as is represented by these few names. What it owes to them cannot be estimated either in money or in honors, but we are glad to hear that they are willing to accept foreign missions in discharge of the party obligations to them, and, in the language of the market, "call it square." Of course to call for testimonials in support of such claims would be rather absurd; but if President Harrison cares for them, we believe he will be more than satisfied by the readiness of all to join in recommending each one. Mr. Reid has already testified in very strong terms to the commanding ability of Col. Shepard, and Col. Shepard has performed a similar office for Mr. Reid, and so have Mr. Smith and Prof. Fitch and Mr. Halstead, and so on. In fact, their endorsement of each other would bear a curious resemblance to the dancing figure known in the French tongue as "chassez-croisez." Mr. Rice has not fared so well as the others at the hands of his brethren, but this is doubtless because, as the editor of a monthly review, he lives in a more serene upper air than the daily journalists. But we question very much whether President Harrison is not really under greater obligations to him than to any of the others; for was he not the author of the article on "Maxims and Markets," in the *Review* of October last, in which he reported that famous conversation of his with an English statesman?

> "Said a great English statesman and political economist to me, at the time of the resumption of specie payments: 'Why, it is contrary to all laws of political economy.'
>
> "'The American people,' I replied, 'do not care much for the laws of political economy; they have been making their laws for some time, and only look to results. The results have spoken for themselves.'"

At any rate, they all want first-class missions, it is said, and Europe is waiting with considerable anxiety for the result of their efforts. The exact effect of the sudden influx of so much American mind into the diplomatic and court circles of that quarter of the globe of course cannot be foreseen, but every one must admit that it will be serious. The precise influence on Western thought of the flight of the Greek philosophers from Constantinople after the capture of that city by the Turks in 1453, has never been exactly defined, but every one acknowledges that it was great and far-reaching. And we may be sure the appearance of these journalists of ours in places like London, Vienna, Paris, Rome, and Berlin will have some profound and decisive influence on the intellectual and social conditions of those capitals.

In the meantime, we confess we consider the recent dead silence of Col. Elliott F. Shepard and of the Hon. Whitelaw Reid, in their respective journals, touching foreign missions, and the best manner of filling them, as an indication of too much delicacy of feeling. Of course no one would expect Col. Shepard to expatiate on his own fitness to represent a great Christian nation at the dissolute courts of London or Paris, but surely the Hon. Whitelaw Reid might do it for him in the columns of the *Tribune*. And, on the other hand, while the reticence of the *Tribune* touching the fitness of various persons, including Mr. Reid himself, to succeed Motley, and Adams, and Lowell, and Phelps in London is quite natural and creditable, why should Col. Shepard keep quiet about it, as far as regards Mr. Reid? If each of these gentlemen would speak his full mind about the other, it would not only be magnanimous and chivalrous, but would help Gen. Harrison greatly in making his choice; and Heaven knows he needs all the help he can get from any quarter.

CONCERNING THE CUSTOM-HOUSE.

It is fair to suppose that the New York Custom-house will, according to long-standing usage, be one of the first things to occupy the attention of the new Administration. The Collectorship is one of the most valuable places in the gift of the President. The New York Custom-house is probably the largest and most important office of its kind in the world. "The greatest annual collection of customs duties at all the ports in the United Kingdom," we learn from the Centennial Handbook issued by the Naval Office, "was in 1859, when they aggregated £24,824,578, or $120,810,008. The receipts from the same source at the port of New York alone were, in 1882, $152,110,032." The amount of duties collected in this port in the year 1888 was $140,880,080, or nearly two-thirds of the total revenue of the United States Government.

It will be easily seen from these figures that the management of this great public office must be, if not the chief concern, certainly one of the chief concerns, of the Secretary of the Treasury whoever he may be. We are not going now to discuss the question whether an agency of such importance should or should not be treated as political "spoils" and bestowed as the reward of partisan activity. Our opinions on this point do not need to be restated here. The matter to which we respectfully ask Secretary Windom's attention, is one which it will answer our present purpose to discuss from the point of view of those who think that such places in the Custom-house as are not covered by the Civil-Service Law should be treated as the means of paying for party service. There is no Secretary of the Treasury nowadays, whether he holds the spoils doctrine or not, who will not agree that the officers of such an establishment, no matter for what reason they get their appointments, should be intelligent, honest, and faithful men of good repute in the community, who would dread dismissal for other and better reasons than the mere loss of their salaries. One of the first duties of every Secretary, therefore, should be, as it seems to us, especially if his predecessor has belonged to the opposite party, to satisfy himself that the New York Custom-house is efficiently manned and its business conducted in an orderly and proper manner.

This investigation is the more imperatively called for at Mr. Windom's hands because of the fact—an unprecedented fact, we believe—that Mr. Fairchild, in the last months of his term, made and presented to the Senate a number of reports going to show that the customs service at this port, as well as others of minor importance, was grossly corrupt and inefficient; that many of its leading members had been for some time past concerned in the perpetration of enormous frauds in the revenue in complicity with a number of dishonest importers, and that there existed and exists here a criminal combination, known as "the sugar ring," made up in part of Custom-house officers and brokers and in part of sugar refiners, the object of which is to cheat the Government in

the valuation of imported sugars. These statements have been supported by the dismissal without trial of several officers of long standing in the service and hitherto of good repute. No such account of the condition of the public service has, we believe, ever before been given by any administration on retiring from office. In fact, it involves so much condemnation of the officer making it that we are warranted in describing it as a confession of failure and incompetency such as would almost warrant impeachment, because it has neither been accompanied nor preceded by any such criminal prosecutions as the law commands in all cases of detected frauds in the collection of customs duties.

We would therefore earnestly and respectfully suggest to Secretary Windom that it is his first duty, under these extraordinary circumstances, to institute a searching inquiry into the condition of the Custom-house, as described by his predecessor, for two specific reasons. The first, of course, and most imperative, is, that he may satisfy himself that proper machinery for the collection of the revenue exists in the Appraiser's Department —the most important of all. This has been described by Mr. Fairchild as the chief seat of the alleged frauds, and in the last months of his term he made an attempt to reform it by substituting several new officers for old ones whom he had discharged. But it is obvious that the judgment of an officer who permits fraud to prevail unchecked through his whole term is not to be implicitly relied on with regard to appointments any more than dismissals. It may be, for instance, that Mr. Stearns, who has taken Mr. McMullen's place at the head of the Appraiser's Department, is a more honest and efficient appraiser than Mr. McMullen, but we cannot be satisfied on this point with the testimony of a gentleman who during four years of administration failed, by his own admission, to find McMullen out. We need public investigation at the hands of a competent commission, like Secretary Sherman's, which should contain, we would suggest, one lawyer in good standing, one experienced business man of this city, not engaged in importation, and one business man from the West, without prejudices for or against custom-houses. They should, however, all three be men sufficiently conspicuous to command public confidence.

The second reason for instituting such an investigation is perhaps of not such direct importance to the Government as the first, but its indirect importance is very great. Our Government, like every other civilized government, is interested in attracting to its service, and especially to its fiscal service, capable men of good character. Even the most ardent advocate of the spoils system admits this. What he says when pushed to the wall on this point is, that as good men are obtainable under the spoils system as under any other. Now, one of the greatest defects of the spoils system lies in the arbitrary dismissals which form so prominent a feature in its working. It gets rid of public servants in much the same way—barring the strangulation—in which they used to be got rid of in old Turkey, and in which they are still got rid of in modern Turkey, Spain, and Greece, and some other semi-barbarous countries. It kicks men out of office, no matter what their official value may be, if it finds it can turn the office to better account for party purposes. But one of the good features of the spoils system has been that peremptory dismissal, without cause assigned, does not convey an imputation on a man's character. To lose one's place in the Custom-house or Post-office has not hitherto meant that one was suspected of lying or stealing. It has been the custom, as well as the law of the service, whenever a man was accused of worse offences than drunkenness, or insubordination, or laziness, or absence without leave, or incompetency, to have him arrested, indicted, and prosecuted, or, in other words, to submit to a competent tribunal all charges reflecting on his integrity.

Now, we earnestly call Secretary Windom's attention to the fact that Mr. Fairchild has introduced into the service the practice of dismissing officers on charges of fraud without trial, and without giving them any opportunity to defend themselves. He has accused them of indictable offences in official reports which, as privileged communications, they could not attack in a court of law, thus sending them out into the world with a cloud resting on their reputation which must, in a large number of cases, seriously interfere with their obtaining other employment for the support of themselves or their families. It is hardly necessary to point out or expatiate on the effect this practice must, if not promptly extirpated, have in preventing respectable men, whose character is their chief capital, from entering the public service, especially in places in which character is so important as in the Appraiser's Department. A man possessing the qualifications, both moral and professional, needed for that department would be considered in the highest degree imprudent if he took a place in which, for instance, he would be exposed to the treatment Mr. Fairchild has dealt out to Mr. McMullen. If such treatment were to become part of the permanent official practice, the Custom-house would soon be manned in all its departments by the black sheep of the business world—men who had nothing to lose by slander, and to whom even a month's salary was of the last importance.

PHILADELPHIAN REFLECTIONS ON WANAMAKER.

Mr. Wharton Barker, who is a good old-fashioned Pennsylvania protectionist, takes, in the last number of his *American*, much the same view of the Cabinet in general as most intelligent and self-respecting Republicans do. We cite him, however, not as an authority on the Cabinet in general, but on Mr. Wanamaker, the Postmaster-General. We believe that what he says touching this particular selection expresses the sentiments of 90 per cent. of the respectable men of Philadelphia, the scene of Wanamaker's activities, both religious and secular. They believe, with Mr. Barker, that Wanamaker comes into office—"not upon his own merits, not as one equipped at all points for the direction of the vast appointment system of the postal service, but as the agent of Mr. Quay and the representative of Mr. Quay's purposes."

And this Mr. Quay is the man of whom the Philadelphia *Press* said in 1885, when he was talked of for the State Treasurership, that his nomination "would take the lid from off the Treasury, and uncover secrets before which Republicans would stand dumb."

The "secrets" about Quay, before which Republicans would "stand dumb," are, we repeat, well known to scores of business men in Philadelphia. If they were not known to Wanamaker when he paid his campaign funds over to Quay, it would show that he was far too simple-minded and too remote from the currents of financial and political gossip to be fit to conduct his own great store, not to speak of the Post-office Department. The Philadelphia *Ledger*, which came to his defence against the *Evening Post* two months ago, was asked to say whether it thought Mr. Wanamaker was ignorant of Mr. Quay's character when he paid him the money; but that journal, which is much too respectable either to quibble or evade for anybody, has ever since kept dead silence about the matter—and in this case, as in many others, silence is confession.

The truth is, that Mr. Barker speaks the sober second thought of all that is best in the Republican party on this great scandal. General Harrison has committed the irretrievable fault of giving a Cabinet office to a man in return for money raised for campaign purposes, and not only this, but for money paid over to a politician whose dishonesty and corruption had already made him a byword in his own party. This is the first time such a thing has ever been done in American politics even by the worst men in our worst days. President Hayes incurred odium, of which he will never get rid as long as he lives, by rewarding with office the paltry scamps who were suspected of having dishonestly turned over to him the vote of the State of Louisiana, but the places he gave them were suited to their base obscurity. The elevation of Wanamaker is the first case on record in which a man has been invited to take a seat at the President's council board as his adviser on all the great national questions of war and peace, at the demand of a corruptionist, in return for money paid to a corruptionist. If we are not greatly mistaken, the case is aggravated by the knowledge which President Harrison now possesses of the circumstances under which Wanamaker tried unsuccessfully to raise $400,000 in the last week of the canvass in this city—circumstances which throw a flood of light on the man's real character. The mistake of giving him a great office is, we repeat, radical and irretrievable. It is one of those which cannot be corrected or wiped out. It has stamped the Administration with an opprobrium which will grow worse as the years go by, and will cling to President Harrison after he leaves office.

We say all this with sincere regret, because in every attempt President Harrison makes to purify the civil service of the

Government, and abolish its corrupt connection with party politics, he has, and will have, our heartiest sympathy and support. But the Wanamaker incident must inevitably weaken the moral effect, as an example and precedent, of everything he does to improve our Governmental machinery. The worst men will rejoice in it most as showing that even in his most solemn moments he was not superior to the motives which govern their own conduct.

There is another aspect of the case which, delicate as it is, must be touched on. Gen. Harrison, who has done this thing, is a very religious man. Wanamaker, whom Quay has forced upon him, is another very religious man. Almost all the outspoken and hearty defence of the selection of Wanamaker has come from clergymen and religious newspapers. Almost all the foul abuse which has been heaped on the *Evening Post* for being the first and loudest to protest against it, has come from lips trained to prayer and praise. The worldlings explain this to us with a smile by telling us that Wanamaker and his kind, "the Pharisees," as Judge Gresham calls them, debauch the clergy by their contributions to churches and Sunday-schools, and debauch the religious newspapers by their "ads." If this be not true, it looks so like the truth, there are so many facts which give color and plausibility to it, that it has obtained a lodgment in the popular mind which cannot be shaken. And we should like to ask those religious men, both clergy and laity, who are troubled by the decline of church influence in this city and elsewhere, and by the growth of agnosticism and indifference, and who meet every now and then to debate its causes, whether they have ever seriously considered the effect on doubters, unbelievers, and scoffers, of the spectacle, so frequent in our days, of corruptionists of every description using the church and the Sunday-school and the religious press as a sort of fortified camps from which to make raids on the things which all civilized societies hold dearest? If they have not, they cannot begin to ponder it too soon. It is to-day by far the greatest enemy with which the Church has to contend in this country. Nothing is easier for a large class among us than to give lavishly in checks to religious objects, and nothing more disheartening for those who are trying to raise the standard of political morality than to find these checks flourished in their faces as answers to charges of the most barefaced corruption.

A PRACTICAL COMMENTARY ON HENRY GEORGE'S LAND THEORIES.

In the latter part of 'Progress and Poverty,' the author urges that private property in land is unnecessary because there have been so many cases where a different system has been in operation. His argument is that public ownership is perfectly practicable, because nearly every country has tried it and given it up. He does not inquire why people gave it up, nor does he seem to think that this point has any material bearing on the argument.

It so happens that we have in the United States to-day one case, of considerable importance, where people are trying to manage real estate on mediæval methods. This is seen in the oyster beds of Chesapeake Bay, as regulated by the laws of Maryland. In a recent number of the Baltimore *Sun*, Mr. John K. Cowen describes the methods in force and their industrial effects. The existing condition he describes as follows:

"Certain ill-defined and ill-bounded parts of the Chesapeake and its tributaries and of other oyster grounds are set apart for dredging. Certain other portions are set apart for 'tonging,' and dredging therein is prohibited. There is also a right given to individuals to take up five acres of land under water forming no part of a natural bed of oysters; but the title to the five acres seems to be a license only, revocable at the pleasure of the State, and the licensee has no assurance of a permanent holding to warrant his going to expense and trouble. For any large purpose the '5-acre' legislation is practically worthless."

It will be seen that this is almost exactly the system of the mediæval village, with its ill-defined common, its ill-defined forest-land, and its extremely precarious rights of use of individual strips of the soil. We know from history what was the result to the mediæval village. The system prevented the population from getting a large and comfortable living from the land. Agriculture remained in the rudest condition. The soil was not improved, because nobody could afford to spend his energies in a way for which he himself personally could obtain no return. The only way to have the land properly and intelligently tilled, with a view to the future as well as to the present, was by private ownership. The communities which introduced this system prospered; those which refused to see its advantages fell behind. It was by a process of natural selection that private ownership of agricultural land was thus introduced. Without it, investment of capital was impossible. By the aid of such investment a larger population could be supported in better comfort.

It is striking how this history is repeating itself in the case of the oyster-beds of the Chesapeake. Prof. Brooks's report on the subject in 1884, supplemented by Mr. Cowen's observation, reveals the following facts:

(1.) That the oyster-beds of the State are being exhausted so rapidly that in a few years more this industry, in spite of natural advantages, will practically cease to exist.

(2.) That the system not merely is destructive in itself, but stands in the way of enormous possible development. The oyster fishermen have never earned much more than $2,000,000 a year, but it is no exaggeration to say that the Maryland grounds, under proper legislation, are capable of yielding tens of millions of dollars annually. New York, New Jersey, and Connecticut have laws which make intelligent and far-sighted oyster farming a possibility. Fifty thousand acres of barren ground in Long Island Sound have been made into productive oyster beds. Even when the administration of these laws has been intrusted to unwise authorities, it has not prevented the public as a whole from reaping the benefits of the system of private ownership. The production of the oyster has been multiplied a hundred fold. Meantime, the Maryland oyster men have been engaged in petty squabbles among themselves, and the whole industry has been falling behind. Prof. Brooks says that the departure of the oyster industry from Maryland to Connecticut in the near future is a certainty, unless Maryland adopts measures similar or equivalent to those which have in a few years raised the oyster grounds of that State from a position of insignificance to the front rank. Chief among these measures have been laws defining and protecting rights of private property.

(3.) While the attempt to keep these grounds as public property has prevented the proper development of the industry, it has also had an unfavorable effect on Maryland's State finances. Six hundred thousand acres of oyster ground in 1883 were paying only $70,000 a year in taxes, while the Governor of Rhode Island about the same time reported a return to his State of over $11,000 from 1,100 acres of oyster ground, none of which was naturally so valuable as that of Maryland. On this basis, the revenue of Maryland should have been $6,000,000 a year from this source instead of $70,000.

It is of course conceivable that new methods might be adopted and the industry developed by direct and positive State action, instead of through the aid of private capitalists, but the chance of success in this direction is small. "France," says Mr. Cowen, "tried this Government cultivation of oysters under the most favorable circumstances, the best scientific talent, a better organized civil service than ours, and with a popular opinion supporting State interference in industrial pursuits to an extent unknown among us; but the experiment failed, and failed for the reason that it must always fail, because, as pithily stated in one of the reports of the French Commission, the State is the poorest merchant in France."

We commend the study of this case to the land reformers. It is not an unfair instance. It does not stand alone. It represents a natural tendency in civilized society. With rude agriculture, rude mining, or rude oyster-farming, common ownership of land has been possible and has prevailed. But the moment the progress of invention made it profitable to apply capital to land, the legal system had to adapt itself to the new conditions. When permanent buildings were developed, permanent tenure of home lots became a legal necessity. When manure was invented, the same process was applied to agriculture. When mining machinery superseded primitive washing or digging, the same reform took place in the mining laws. The case of the oyster farms of Maryland is simply another instance of the universal law.

THE CHURCH AND THE THEATRE.

It looks as if Macaulay's Puritan were fumbling at the doors of the theatre which he so incontinently locked at the time of the Commonwealth, when we find a prominent divine publicly praising a certain play, and advising

people to go to see it—especially when, as is the case, it is a member of that denomination the Presbyterian, which stands most distinctly to-day for the Puritan tradition. It would be hasty to infer from this a recognition on the part of the lineal descendants of the Puritans that they have really been in the prison-house of the spirit, where Matthew Arnold located them, and that their ideal of life has been found out to be one of hideousness and immense ennui, as the same writer declared it to be. The Puritan never felt that to be true, or he would have ceased to be a Puritan, and the fact we cite is only another instance of the tardy acquiescence of the clergy in a practice which the laity have established in the face of constant clerical protests; for, just as there is no doubt that the churches represent the best elements of society, so there is no doubt that Mr. Daly is right in his frequent assertion that the best elements of society now patronize the theatre. The old ecclesiastical statutes against theatre-going remain unrepealed, though the younger generation of church-members have so little reason to know of their existence that they may be almost acquitted of violating them; and the attitude of the clergy is getting to be the one made familiar in the cases of other amusements—after protests unavailing, then winking at the evil, and, finally, a qualified permission of what they long ago ceased to be able to prevent.

This has a certain social interest, though it is an old story now; but much more interesting is the growing tendency to claim for the Church a large part of the credit for the admitted elevation of the stage in the last thirty years. That is to say, it is maintained that the resolute hostility of the Church to the theatre of a generation ago helped the public to discriminate between good and bad drama, forced managers to cater to a taste which was higher than prevailing standards, and so brought about the immense change to be noted in the English stage since, for example, the first edition of Lewes's 'Actors and Acting.' Look at the theatre of forty years ago, say the apologists, when church-people were standing aloof, and then see how things are changed to-day, when unobjectionable plays are witnessed by so many church-people. Indeed, it does not require a great stretch of the imagination to see a grand apologetic argument made out, fifty years from now, along the lines of those which are already familiar, setting forth the purifying and elevating power of the Church over a social institution, originally its own, but fallen into debasement, brought back again at last to harmlessness and even to its own service. The fact that such an argument is only beginning to be written, enables us to see the measure of truth and force in it better than would be possible after it had passed into the treatises on the "evidences."

That it would have an element of truth must be conceded. Hostility to that which is low in taste and bad in morals cannot but do good, and the more organized and powerful the hostility, the better the effect. But the hostility of the Church to a debased theatre is not the only hostility that institution has had to encounter, nor the most effective. It would be hard to name a distinctly ecclesiastical writer who ever whipped the theatre of the Restoration with such vigorous strokes as Macaulay's, or pricked it with such keen satire as Thackeray's; or one who had harder things to say of the degenerate stage of the middle of this century than Lewes—and none of these critics could be called exactly evangelical in belief. And the weakness of the denunciations directed against the theatre by the Church is, that they have been almost always sweeping and wholesale; that they have professed to see no possibility of improvement, and have gone in for root-and-branch methods. Now that attitude never can provoke amendment. The censor who points out a better way at the same time that he denounces the bad way, is the only one who will be listened to while he smites; others will be set down as mere scolds. And it is clearly to the faithful wounds of such friends, and to the general amelioration of manners and taste, that improved theatrical standards are due, rather than to the steady opposition and aloofness of the Church as such. That the Church has had a large part in bringing in the day of bettered manners and higher taste is, of course, true, and in this way it has indirectly done much to benefit the theatre; yet, even so, only as one of many conspiring influences.

There may be a hint in this line of remark at the processes which have been at work in building up the famous apologetical arguments for Christianity long since made up and in the books. They have been stated as fairly and intelligently by Lecky and Ulhorn and Brace as by any one, to the general effect, as is well known, that the great enlargement of the spirit of humanity which is admitted on all hands to have taken place is the direct and exclusive effect of the Christian religion. It was a favorite thesis of Heine that this conclusion was radically wrong, and Frederic Harrison takes up a frequent parable against it in our own days. We are probably too far removed from the facts ever to be certain of their exact causes and effects; but, if we may judge the past by the present, it may well be believed that the apologists have been too confident and exclusive. They have forgotten that the Church, wide and deep as has been its influence, does not, after all, embrace the whole of the activity of man and the development of society. At any rate we can see, in the case in hand, that they will be greatly overdoing their part if they assert for the Church more than a partial effect among the influences that have brought about the better days of the stage.

AMERICAN HISTORICAL MANUSCRIPTS IN FOREIGN ARCHIVES.

ALASSIO, February 14, 1889.

THE mention in a recent number of the *Nation* (No. 1226) of the project of Mr. B. F. Stevens for publishing photographic facsimiles of various historical and diplomatic documents relating to the United States in the English and other foreign archives, and especially the lack of attention bestowed by Congress upon his previous plans for printing and indexing, lead me to believe that the importance of this subject has not been sufficiently understood by cultivated Americans who are not active members of historical societies or habitual readers of historical magazines.

But before speaking of the wealth of documents relating to our historical period now existing in foreign archives, and unknown to Americans, or to all save a very few students who have had the money and the leisure to pursue their investigations in Europe, it may be worth while to say a few words about the present condition of archive study in general, and of what foreign governments have done in this respect.

The study of history, as well as the manner of writing it, has entirely changed during the present century. Up to a certain time historians felt it their duty laboriously to consult all the works of their predecessors in the same line, and to treat their statements and arguments as though they were so many original authorities. There was little study of the original sources except so far as concerned ancient history, and even there such study was confined to the classical historians, with little reference to coins, inscriptions, and other sidelights; every writer was considered in one way equal. In other words, criticism of authorities had scarcely been introduced. During this century—we might almost say during the last fifty years—all this has been changed. A school of historians arose, which speedily found support in all countries, showing that the only real way of studying history of any kind, whether ancient or modern, was in going as close to the original sources as possible. For modern history this has meant very much the study of archives, and most governments have responded to the call of inquirers and historical students in throwing open the collections of public documents intrusted to their care. These are no longer considered as secrets which are only to be communicated to men who happen to be in office at the time, unless they refer to matters of very late date; and, under certain restrictions, they have gradually been opened to the general public. They are not open in the same sense that a public library is open. It is necessary to obtain permission, for which it is requisite to present some guarantee of the serious purpose with which the studies are undertaken, and some surveillance is usually exercised to see that manuscripts are not carried off. But in most countries these restrictions are only such as are applied to the study of old manuscripts in any great library. It may be said here that most European countries are in this respect more liberal than the United States, where the documents in the possession of the State Department are guarded most jealously, and it is very difficult to obtain permission to see them. Some amusing examples of these difficulties were given by the late Frederick Kapp, who, when writing his life of Baron Steuben, was refused permission to consult the papers about him in our national archives.

Most European archives have been carefully arranged of late years in rooms which permit of easy access to them, with additional rooms for the purposes of historical study; and nearly all of them have also been well indexed, so that it is possible for the archivist to place at once his hands on any document. I can speak with regard to this positively, because I have studied in the archives of Paris, the Hague, Vienna, Moscow, Venice, and various former Italian capitals. At the Hague perhaps the authorities were too lax, for I was left alone for hours in a room filled with documents, with no one to supervise me. The most comfortable place

was Moscow, where all the documents relating to foreign affairs are preserved down to the beginning of the present century (the later ones being in St. Petersburg) in a building recently erected for that purpose. More than this, European governments have begun a system of publishing portions of their archives, in some cases the older ones, which are more difficult to decipher and ought not to be too much handled, and in others those pertaining to historical periods of very general interest; and they are trying to complete the public documents in their own possession by others relating to them in foreign archives.

Taking things at haphazard, when the French began to consider that Russian affairs were worth investigating, they found that the Imperial Public Library at St. Petersburg possessed a large number of French archives, which, when they were pillaged during the Revolution, had been bought up by the Russian Ambassador, Prince Vorontsóf; and during the time that I was living at St. Petersburg a number of persons were kept copying these documents for the purpose of restoring the series of French archives. Even before that, owing to M. Guizot, there had begun the publication of a "Collection de Documents inédits sur l'histoire de France," of which a thousand copies were printed at Government expense, but of which only two hundred were offered for sale. This publication began in 1836, and down to 1875 175 quarto and folio volumes had been published. Then there were the series of Petitot and other memoirs, partly supported by Government. Armand Baschet, Frédéric Masson, and Albert Sorel have published much about the archives of foreign affairs; and in the last few years there has been begun, under Government supervision, the publication of the instructions to ambassadors in various countries, of which five volumes have been published with regard to Austria, Sweden, Portugal, and Poland. Besides this the École des Chartes, from which most French archivists are now drawn, has printed many documents relating to purely French historical manuscripts.

In Belgium the Royal Commission for the publication of the ancient Laws and Ordonnances has published, down to 1879, about fifty-six volumes. In Italy, apart from the work of the various private historical societies and those partly belonging to the Government and the Historical Institute, the reports of Venetian ambassadors to various States in Italy and abroad have been published; which from 1839 to 1863 amounted to fifteen large volumes. In Spain forty-two octavo volumes were published between 1866 and 1884, under the head of "Collection of unpublished Documents relative to the Discovery, Conquest, and Organization of the former Spanish Possessions of America and Oceana, drawn from the Archives of the Kingdom, and more especially the Indies." In addition to this series, seventy-seven octavo volumes were published between 1842 and 1881, called "Unpublished Documents of the History of Spain." Even Rumania, on becoming independent, immediately set about learning its past history. Baron Hormuzáki, who had been employed in the Austrian Foreign Office, had taken advantage of his position to copy out from the archives all of the documents which he found there relating to Rumanian affairs. These, on his death, were bequeathed to the Rumanian Government, and have been published, and include important information relative to Turkey and Russia, containing among other things detailed reports of the defeat of Peter the Great on the Pruth. In addition to this, the agents of the Rumanian Government have copied out in the archives of Venice and Rome, and are doing it now in other countries, all that relates to Rumania, several volumes of which have been already printed.

In Russia, since the archives have been opened, the study of history, and especially of historical documents, has obtained a great development. The Archæographical Commission, a Government body, has printed a large number of volumes, chiefly of early historical documents. The Imperial Historical Society, of which the present Emperor was President until his accession, now succeeded by the Grand Duke Vladimir, has published already sixty-three volumes since the year 1867, nearly all of which are drawn from Russian and foreign archives, including the despatches of the English, French, Dutch, Saxon, Prussian, and Austrian Ministers to their own governments from the earliest times. These are given in the original with a Russian translation. Private individuals, like Turgeneff and like Theiner, partly with the help of the Government, have published documents relating to Russia found in the library of the Vatican; and now Father Pierling, a Russian Jesuit, is following in the same track, after ransacking not only all the public archives, but all the private and family archives in Italy accessible to him. There are, besides, at least three historical journals entirely devoted to historical material—sometimes merely diaries and journals, and at others articles made up from recollections and reminiscences: the *Rúskii Archív*, the *Rúskaya Starinà*, and the *Istoritcheskii Viestnik*.

In England, where the prejudices in favor of the secrecy of historical documents remained longer than in most countries, the Government has now set to work with good will. One hundred and twenty-seven volumes have been published of "Calendars of State Papers," which are so full as almost to supply the place of complete documents. They were begun in 1856. Of these there is a domestic series—one relating to Scotland, one relating to Ireland; a colonial series, which extends to 1668 only; a foreign series, which goes to 1577; Treasury papers and Home Office papers. Then there are the "Chronicles and Memorials of Great Britain and Ireland during the Middle Ages," of which there are seventy-four distinct works, many of them in several volumes. Besides this must be mentioned the publications of the Record Commissioners, the Scotch and the Irish record publications; and we should not forget the various reports of the Royal Historical Manuscripts Commission, the object of which is to catalogue and summarize all the important documents relating to English history in the archives of private families.

In our country the colonial and regional history naturally fell to the lot of the States, and both legislatures and historical societies have done all that was incumbent upon them. In New York, for instance, the State sent Mr. Romeyn Brodhead to collect documents in Holland, France, and England, and printed ten volumes and an index of these documents, under the title of "Colonial History," for which, altogether, over $160,000 was expended. Of the first seven volumes five thousand copies each were printed. This is exclusive of the expense incurred for publishing four volumes of "Calendars of Historical Manuscripts," four volumes of "Documentary History," and three volumes of "Colonial History," all the materials for which existed already in the State archives.

The Federal Government began also by doing well. It purchased the papers of Washington for $45,000, those of Monroe for $20,000, and those of Hamilton for $26,000, including the expenses of publication, as well as large collections of papers of Jefferson, Madison, and John Adams, the last great acquisition in this line being those papers of Franklin, preserved in England, which have recently been turned to very good use by historical students. Besides this, the Government printed the proceedings of the convention which formed the Constitution, and the secret journals of the old Congress, at an expense of $10,542; the "Diplomatic Correspondence of the American Revolution," edited by Jared Sparks, which was originally printed in Boston in 1829 and 1830, in twelve volumes, at a cost of $50,000, and was subsequently reprinted at Washington in 1857 in six volumes; the diplomatic correspondence from 1783 to 1789, printed at Washington in 1833 and 1834, in seven volumes, at a cost of over $16,000, and reprinted in 1837, in three volumes; the diplomatic correspondence from 1789 to 1828, entitled "American State Papers, Class I, Foreign Relations," which was published in six volumes at Washington, from 1832 to 1859; and the collection of "American Archives" edited by the late Peter Force, of which nine volumes were published at Washington between 1837 and 1848, at a cost of over $236,000. The State Department possesses also a large mass of other papers relating to our Revolutionary history which are almost unknown, owing to the want of funds for indexing them, and the restrictions on the study of historical students; and, among a mass of other material, all the journals, law books, etc., of the Russian-American Company, which are very important for the history of the whole Pacific Coast, and ought by all means to be readily accessible.

Most of what has been mentioned the Government was able to do before the war, when its resources were much more limited than at present; and even then it spent by no means as much for illustrating its physical conditions and natural productions, in the shape of travels, surveys, and explorations under the charge of the War, the Navy, and the Interior Departments.

In various European archives there still exists a mass of matter practically, and in many cases wholly, unknown in America, the careful study of which would throw an entirely new light on many events in our early history. Mr. Bancroft, in his preliminary studies for his history, made and had made copious extracts from the papers to which he obtained access; but many have become accessible and even known since that time. Mr. Henry Adams, too, possesses copies of very many foreign state papers relating to American history during the early part of the present century. Even should these collections come into the possession of the State Department or of the National Library, they would be imperfect. Unfortunately, it is not easy for students of American history to visit European capitals with sufficient means and leisure, as well as official introductions, to enable them to study the archives thoroughly. Some of them find it difficult to make a prolonged stay for such a purpose even at Washington, Boston, or Albany; and it is of importance, therefore, not only that our Government should acquire everything which can throw a light on the history of our country, but that all of this should be printed, so as to be widely accessible.

Before, however, speaking in detail of what exists in Europe in manuscript, it should be mentioned that much which has been printed in Europe is practically unknown and can with difficulty be found in America. I refer especially to *blue-books* of various kinds; that is, publications of official papers and reports by foreign governments, either relating to diplo-

matic negotiations, or simply the reports of consuls on trade and finance, which are interesting and even important as the work of independent trained observers. As to the diplomatic papers printed in various forms, the most of them do not appear in any American collection. The only things, for instance, common to the English and our diplomatic correspondence are the treaties, memorandums, and protocols, and the actual despatches exchanged between the officials of the two Governments. The covering despatches and the instructions of an English minister, for example, would not appear in papers sent to Congress by the President and then printed. It would be a useful and profitable exercise on the part of some historical student who could obtain access to a complete collection of English state papers and blue-books, to index and catalogue all those relating to the United States. A complete series of English blue-books may exist in the Library of Congress; but it does not exist in the library of the State Department, or did not at least exist there three years ago, when I last had the opportunity of consulting it.

To proceed to details. The collection of papers relating to our Revolutionary history in the Russian archives at Moscow is probably the least important, although by no means the least interesting. I was myself enabled to consult them, and published a partial account of them in the *Nation* of June 11, 1868. The papers relating directly to the mission of Mr. Dana are few and unimportant; but the despatches of the Russian ambassadors at Paris, London, and the Hague are full of interesting details of the movements and activity of the American agents, and of the relations of England towards her revolted colonies. By order of Catherine II., the Russian Ambassador at Paris employed a special agent at Philadelphia, who transmitted on all possible occasions accounts of what was going on in America, including details and even plans of the various battles.

Similar reports are said to exist in the archives of Berlin, and in those of Hanau, Brunswick, Waldeck, Bayreuth, and other places. There are many documents relating to the employment of German troops during the Revolutionary War, some of which were consulted by Max von Eelking in his book 'Die Deutsche Hilfstruppen im Nord-Americanischen Befreiungs-Kriege.'

In Spain it was not known, until Mr. Stevens's searches, that any papers existed earlier than 1790; but he found in Alcalá, Seville, and Simancas an immense correspondence between Spain, France, Holland, and England, of which some papers are of great value, and throw unexpected light on the action of France and Spain. In Holland there are many original documents which have never been collated, and perhaps have never been seen since their *précis* were made and filed. These *précis* or proceedings of the States-General alone have been copied and used by historians. Of these printed *précis* a good collection exists in our State Department.

The French archives contain the correspondence between the French Government and the French ministers in Philadelphia, as well as with the American commissioners; and the correspondence of the French admirals and generals with their Government and with the American military and civil authorities; together with the journals of the men-of-war, which gave not only the nautical intelligence, but the most minute details of life and society in the colonies. The correspondence of De Grasse, Rochambeau, Barras, Lafayette, John Paul Jones, Franklin, Arnold, Fleury, Greene, Hancock, Laurens, Washington, and others is voluminous. These documents are of very great importance. There is also the correspondence between the French and the Spanish Governments on all the questions relating to the independence of the American colonies; among which are very many letters which were considered so private that Vergennes, Minister of Foreign Affairs, translated them himself.

Naturally, the documents preserved in England are by far the most important to us, as it is necessary for any historian to see both sides of the question. Besides diplomatic correspondence with other governments during the American Revolution preserved at the Foreign Office (and until 1783 this includes correspondence with European governments only), there are the various documents in the Public Record Office, now gathered together from the various offices of the Crown; and those relating to America alone, from the earliest times down to the year 1783, fill seven hundred volumes. They include the military correspondence and reports, and the relations between the colonies and the Board of Trade and the other departments of the Government. In addition to these, there are the papers preserved in the British Museum, in the Royal Institution, in the Lansdowne, Germaine, Dartmouth, Auckland, and Carlisle papers—and those of other private families whose members were more or less concerned with American affairs, not all of which are yet brought to light. For the twelve years from 1772 to 1784 Mr. Stevens, who has for the last twenty-five years been engaged in searching for such documents, has catalogued or triply indexed over one hundred and twenty thousand different papers, few of which have ever been published or consulted, and many of which are entirely unknown. He has enjoyed unusual facilities for his researches; and as a former official of the State Department, who, when in London on an official mission, was deputed by the State Department to investigate what Mr. Stevens had done, says: "Probably no one will ever possess better means than his for getting access to the papers. Perhaps no one hereafter will ever gain these facilities. Indeed, privileges have been granted him in order that the work may be done once for all, and that a period may be put to casual demands"; and he reported substantially as follows:

"First, that the papers and data which Mr. Stevens had gathered are indispensable for the history of the United States. Secondly, the work has been done, and thoroughly done, by the most careful and admirable systems, and it is not a question of future accomplishment. Thirdly, the collection is exhaustive, not only of single documents and facts, but all obtainable copies of each have been collated with the standard original, and all statements of facts have been compared. So far as possible the history, uses, and influence of each paper have been recorded."

The proposal of Mr. Stevens for making transcripts of the documents existing in the English archives was strongly supported by Mr. Lowell when Minister at London, by Mr. Evarts when Secretary of State, and by Mr. Frelinghuysen when Secretary of State; and both in 1883 and 1884 the matter was warmly recommended to the Library Committee of the Senate.

For the sake of showing what the work was like, Mr. Stevens deposited in the State Department a collection of papers, including the Clinton-Cornwallis controversy contained in thirty-seven volumes, and amounting to 10,000 neatly written pages. These were offered for sale to the Government in case Congress should appropriate the money. Mr. Bayard, following the example of his predecessors, and supported by various historical societies and historical scholars, warmly recommended not only this purchase, but the furtherance of the other projects of Mr. Stevens. Although all these recommendations have been published, and in some cases have been made by the Library Committees of several Congresses, nothing has been done. The reasons for this are easy, and yet somewhat difficult to give. It is rarely that any private bill, or one that appears to be such, can be put through Congress without the aid of an experienced lobbyist—which costs money. Not that there is need of bribery, but because some one interested in the bill must be constantly on the spot, and watch for all opportunities of bringing it forward; unless, indeed, some Senator or member of Congress should be so interested in the purpose of the bill as to do it *pro bono publico*. It is simply the fault of the system caused by the present rules.

Possibly there may be other reasons; for it is an open secret that there is a little jealousy between the Congressional Library and the State Department as to the possession of archives, documents, and materials for history; and there are two or three collections of manuscripts, and copies made by individual historians, which will sooner or later be offered to the Government for purchase. It is probably safe to say that none of these collections are complete, or that the papers contained in them have been copied with guarantees for accuracy.

The failure of Congress to give attention to the recommendations of the State Department on this subject has caused Mr. Stevens to modify his scheme, and to propose now a series of photolithographic copies of the original documents. There can thus be no question of accuracy in copying or proof-reading, and the student has the advantage of seeing the exact handwriting, erasures, interlineations, and signatures. My own experience in the study of Russian history has taught me that the sight of the original documents, with their changes and annotations in different handwritings, is of far more use than the study of printed copies. You see the original idea, the changes which it went through, and the reticences which are sometimes observed when these papers were read to the monarch or the prime minister. Photolithographic copies are in every sense equal to the originals, with the additional advantage that the student who possesses them or has easy access to them, is not obliged to make long and expensive journeys, or to wait for permissions which perhaps may be good for only two or three hours in a day, in order to find what he is in quest of. He can study at his leisure and at his own time, and can compare the documents drawn from the archives of one country with those coming from another source. I find that the cost of one hundred facsimiles of this kind is about equal to the cost of one hundred well-printed copies; and Mr. Stevens calculates that, at the price which he has fixed, the sale of a hundred copies would reimburse him for his money outlay—his time and experience not being taken into consideration. Surely, with all the libraries, the historical students, and the historical collections, it ought to be easy to obtain subscriptions for the necessary hundred copies. Our Government, however, ought to take at least fifty copies, either included in or additional to this number: partly for the use of the State Department, as completing our archives; for that of the Congressional Library, for the use of historical students, and for the purpose of presenting to foreign governments, in return for the expensive publications which are sent to us—because this series of papers has for them a more direct

interest than the volumes of the Geological Survey or those printed by the Smithsonian Institution—and partly for distribution to the libraries of meritorious but poor colleges. Every university and every college in the country, every historical society, and every State library, should possess at least one copy.

EUGENE SCHUYLER.

SELINUS AND SEGESTA.

PALERMO, February 4.

IN all the legends of the Greek cycle there is nothing more dramatic than the history of the two cities which, by the monuments of their antique glory, most attract the modern wanderer in the western half of Sicily. It is like the feud of Agamemnon and Achilles. Why Selinus, a great and powerful city, with a large command of the sea and a territory even now of surpassing richness (though its soil is burned by a summer sun utterly untempered by forest shade, and the fertility drained by centuries of the most primitive culture, so that the river which once flowed through it and made its port is buried in drifting sands), should have held such bitter and implacable hostility to the little mountain town, perched on almost inaccessible and now utterly barren heights, is difficult to conjecture, unless it be purely in the contentious nature of the Hellenic race—envious, cruel, malignant, never able to see with content the prosperity even of their friends. Their territories were contiguous, but that of Selinus is a broad plain extending back from the sea many miles, and probably including all the level country, for within a few weeks there has been found a hidden treasure near Castel Vetrano, at the edge of the plain, which was composed in great part, if not entirely, of archaic coins of this city. And certainly, with her dominant power, and always the aggressor, the mountaineers had hard fare, and finally, unable to sustain the contest or to placate the enemy, turned to Athens, as the then head of the race, for support. This led to the war between Athens and Syracuse, which latter city favored Selinus, and so finally to the prostration of Athens, as we all know who have read the history of Greece.

But the woes imposed on Sicily were far more disastrous, for when the help of Athens had come to naught, and the Selinuntines were still inexorable, Segesta called on the Carthaginians, who sent Hannibal with a vast force (for Carthage is just across the narrow sea of Tunis, a hundred miles away), and assaulted Selinus with great fury, being, as a good general, aware of the value of time, and how important it was to anticipate the arrival of the always tardy Greeks from Agrigentum. After a ten days' siege, in which the hapless Selinuntines showed the courage of desperation, and in which they had every day to repel a new assault of Hannibal's barbarians, aided by battering rams and assaulting towers, a breach was effected, and the combat carried on through the streets, over barricades and through the houses, till nearly the entire population was put to the sword—twenty-six hundred only, we are told, escaping to Agrigentum, and five thousand women being carried off as slaves. The wrath of the Carthaginian general at the costly resistance left no stone of the city standing on another except those of the temples. It is recorded that the Greek cities sent to Hannibal, asking him to spare the temples of the gods, which were of great richness, as we can even now perceive, and he replied that the gods had abandoned Selinus. But that he did not destroy the temples, we now discover, for, in the recent excavations which have entirely cleared the ruins of the city proper, it is found that before the columns fell the soil had accumulated to a considerable height around them, so that they lie as they fell on a ridge of earth.

This punishment of Selinus was only the pretext for the subjugation of the Greek cities, of which Segesta was one of the first to pay the penalty of calling in the stranger. They are now only two varied types of desolation. Selinus, as seen from a distance, is but a mass of building material. The two low ridges on which the city was built, or perhaps on one of which the city proper stood and on the other only an hieron, is each crowned by confused piles of drums of columns and stones of the walls of the cellas of the temples. The greatest had never been completed; but there is evidence that it had been used for worship before its destruction, and that a part of the cella had been raised. The columns were not yet fluted, as this was done only when the construction was otherwise finished. This temple has not yet been excavated, but will be taken in hand when the present excavations of the city walls and necropolis are done. The temples of the citadel are now entirely cleared, but in them as in those on the other side of the river there is hardly one drum of a column left on another. Only a small portion of a small temple suggests the Nike Apteros at Athens, having a part of its wall standing. At the entrance of the necropolis is a small building which the first excavators considered a tempie, but which now turns out to be a propylæa to the necropolis. In it were found hundreds of lamps of a peculiar pattern for the tombs, and the little votive heads, all of terracotta. The clearing of this ruin is not yet complete, and much new light on the nature of the funeral rites may be expected from the work to be done on this and on the necropolis in general. Of the port and emporium of Selinus not a trace is to be seen. The river sinks into the sands before it reaches the sea, and the drifts of the invading element have buried everything that belonged to them. The ruins still abound in the wild celery, the σέλινον, from which the name of the city is supposed to be derived, and which is nothing like parsley, as the representation on the coins would have shown any one, but is simply the uncultivated celery, as both the form and taste of the leaf show.

For the seeker of the picturesque there is absolutely nothing at Selinus. The site is the bluff which terminates the plain, and looks out on the African Sea with no elevation above the surrounding country. Such a site the Greeks would only have chosen when they had perfected a system of fortification which enabled them to dispense with the advantages of a position made inaccessible by nature. For the archæologist and those who are interested in the military engineering of the Greeks, there is an immense field of study yet to be uncovered; but the tourist will only find the satisfaction of having seen the desolation of one of the most markedly individual of Greek cities. There is no evidence of the temples having been overthrown by man; but, on the contrary, the bases of the columns show that the effect of time and the elements has been to make their supporting surface so small that they must have fallen by their own gravity if not by the shock of an earthquake. As an architectural problem, there is the occurrence, in two examples, of an arch of perfect form, but not even hinting at the principle of the keyed construction, being simply cut in a solid parallelopiped of stone, as if to make the door in which it occurs higher for goers in or out. There is here no question of its being of Roman make, for the Romans had no footing in the island till long after this must have been made.

To Segesta the road lies for nearly twenty miles through the plain, and then we come abruptly into the hilly country which we may suppose was the territory of Segesta. From the railway station we take the diligence up to Calatafime, and thence, by horse or on foot, we have a journey of four or five miles to the site of the city. We catch from the road two or three glimpses of the temple looming above the intervening hills, but sinking behind them as we approach; and when little more than half way to it, the guide led me to a foot-path which plunges down into a narrow valley of luxuriant fertility, and through groves of orange and lemon trees with which the bottom land was planted, and at the further side we began to climb the mountain on which the city used to be. The hillside was planted with olive trees and the path lined with immense cactuses—the ordinary prickly pear, which furnishes one of the most valuable fruits of the region, as it renders enormous crops, and comes in season when other fruits are scarce; and though it is not esteemed as it deserves by those not accustomed to it, it is exported to Naples and southern Italy in quantities, and in still greater is consumed by the population. The path finally leads round the bare hillside through the grain fields and along a dizzy slope, always upward, until we have made the tour of half the circumference of the mountain, when we come suddenly on the temple crowning a spur of the mountain and a few hundred yards away. A slight depression intervenes, so that from the point where we get the first, and best, view of it the temple is seen on the point of the hill, with a wide outlook over the surrounding country in all directions except the west.

At this distance it seems perfect, for we can hardly see that the columns have never been fluted or that the platform is unfinished, much less that no pavement has ever been laid. It seems lower than it is from the great size of the columns, which were still to be reduced in diameter by the finishing work. The closer views are interfered with by the necessity of seeing it from too near a point, as the hill falls away from it so fast that the stylobate is hidden when we are far enough from it to feel the proportions. To the uncritical eye it does not differ much from the tempie of Theseus at Athens, and it cannot be of much later construction if we may judge of the date of the Greek and Sicilian temples by the same canons. It has no sculpture. Its unfinished state has been attributed to the Carthaginian conquest of the island, but there does not seem to me any reason for this attribution. The Carthaginians came in as friends to Segesta, and though they soon made their presence felt as that of masters to those whom they came to serve as friends, they were still allies, and their influence would hardly have been exerted in the direction of hostility to the religion of the city. It is far more likely that the incomplete condition of the work is due to the same cause as that of so many other Greek undertakings—the dilatoriness which was a characteristic of the race, alternating with fits of fiery energy. The temporary want of means to carry on the work would cause a cessation of it; and when the fit of energy was off, the apathy would continue until some new circumstance arose to awaken the good intention again. The triumph over Selinus was far more likely to have stimulated the completion of the temple as a commemoration of it than to have stopped it. It seems to me that the temple must be attributed to a period some years, at

least fifty, earlier than the fall of Selinus, from the consideration of the circumstances both political and architectural, and as more likely to be due to the prior depression of the unfortunate conflict with the rival city, and the consequent poverty. The temple shows the same system of curvatures as the Parthenon.

Besides the theatre and a few fragments of late walls, there is nothing left on the city site proper now visible to the eye; but there have never been any excavations made in the modern spirit of investigation, so that we can hardly conjecture what the earliest origin of the city might be. The traditions, which always have a certain value, are here contradictory, one making it a Trojan colony, and another attributing it to the Elymi, a Pelasgic race. There is no authority for the Trojan theory earlier than Stesichorus, who makes the Trojans of Æneas wander about Sicily; but if there were enough of that unhappy people left to found all the cities that the poets have attributed to them, or the ambition of the inhabitants themselves appropriated—seeking, like an American parvenu, to attach their descent to some famous name—they had better have reconstructed Troy, supposing always that Troy was. The nature of the site is in favor of the Elymean theory, and the absence of any trace of walls such as this might lead us to look for, is not to be wondered at, for the stone of the vicinity is so friable that the later walls which the Greek inhabitants must have had as a necessity of ordinary defence have disappeared. Moreover, as we know that the Pelasgi were colonists here, there is no improbability in making them the authors of a colony whose site is so entirely in accordance with the requirements of that people in all except the building material. As we know, too, that, from the earliest traditions, the Greeks and Pelasgi were allied peoples, the assimilation of the Greeks of the colonization in historical times would not be strange, so that the certain Hellenic character of the people as shown in the later traditions is what we might expect. The architecture, the coinage, the appeal to Athens for help when too hard crowded by Selinus, and, in fact, all the positive traditions of the city, are Greek; and the insistence on the Trojan tradition by Selinus to excuse the inveterate hostility, was only one of the sophisms with which they used to amuse themselves on more important as well as less important occasions. They wanted to find an excuse, and this was the most convenient.

The commanding position of the temple is referred to as "another striking instance of the manner in which the Greeks placed their edifices, so as to harmonize with and be heightened by the surrounding scenery"; but this, with due deference to whoever may think it, is subjective criticism, for there is no evidence that the Greeks had any such manner. The temple of Segesta is put in the only place where it could be put and be at once accessible and defensible. The temples were put on high points from reasons connected with worship and defence, and when such a position was convenient, but there is not the slightest reason to attribute the selection to æsthetic considerations. The theatres were sometimes constructed on a hillside, but for the reason that such a position favored the construction. We have many indications in Greek literature that though the Greeks loved the open air, being a pastoral and agricultural people, they were slightly if at all affected by the beauty of landscape. The early shrines to Zeus as the god of the thunderbolt and the sky, and of Apollo as the god of the rising sun, as well as of Athena when she was the guardian of the city, are on heights, naturally, when the site offers it; but many of the temples are not so advantageously posted from the æsthetic point of view as they might be. Considerations of the ritual were far more imperious then, as now, than any ideas of abstract beauty, and the security of the temple as sanctuary and treasure-house of equal force. The people most devoid of artistic feeling, in ancient times, usually built their temples or erected their altars on heights; and in Catholic countries, even to-day, and much more in the most barbarous epochs, we find it to be the common practice to put the chapels and churches on heights, sometimes simply to make it a penance to worship there. At all events, Segesta proves nothing, for the site of the temple is obligatory—there is no place to put another without extreme inconvenience or hiding the one we have.

The modern history of the antagonistic cities has run pretty much on the same lines as if the fated curse of a common hostility had rested on them both. Selinus never existed after the Carthaginian destruction except as a refuge for outcasts, with the exception of an interval when the security and prosperity of the Saracen rule made the choice of a residence of little importance, while Segesta struggled on till the fourth century in decay; but both have been for centuries without other inhabitants than wandering shepherds, and now of the men put by the Government to guard the archæological treasures of the sites. W. J. Stillman.

THE SOCIETY OF AUTHORS.

London, February, 1889.

The Society of Authors has just held its annual meeting in London. During the year little is heard about the Society unless its members give a dinner, as they did last summer, or hold a conference, as was the case a couple of years ago. It is practically governed by the Committee of Management, and therefore the annual meeting, when their report is read, is an occasion of some importance to every one interested in the profession of literature.

To appreciate at its true value the work that is being done, it is only fair to remember the extreme youth of the Society. It was founded in 1884, but I venture to assert that nothing was known of it, and little was accomplished by it, until 1887, when it was suddenly brought into prominence, and a new impetus given to its members, by three very lively conferences held in Willis's Rooms. The objects of the Society were then made known to the public. It aims at (1) the maintenance, definition, and defence of literary property; (2) the consolidation and amendment of the laws of domestic copyright; (3) the promotion of international copyright. At the conferences to which I have referred, much was said about copyright, but more about publishers. English authors felt they had a distinct grievance in the treatment they received at the hands of American pirates, but a still greater evil was pointed out in their relations with publishers at home. A good many bitter things were said, and afterwards led to a no less bitter newspaper war, in which several publishers took part. A few firms, whose honesty no one doubted, whatever might be thought of their business capacity, announced their intention of thereafter auditing all accounts. It is not probable that firms whose honesty was very much doubted were moved to turn over a new leaf. Since then the Society, while keeping an eye on the copyright question, has devoted most of its time and attention to the defence of literary property.

That which first strikes one on reading the report for the last twelve months, is that up to the present time the Society has been principally a refuge for the outcast, a pillar for the weak, a hospital for the maimed. What I mean is, that the chief work it has hitherto undertaken has consisted "in examining agreements, advising upon complaints and grievances, and obtaining legal opinions for the guidance and protection of members"; and also in reading MSS. and giving an opinion as to their merits and advice as to their publication. Now, the author whose work is worth publishing, it is usually found, can make his agreements for himself, and even Walter Besant, in the course of yesterday's proceedings, had occasion to point out that the members of the Council who were present—Edmund Gosse, Rider Haggard, Sir Frederick Pollock, and himself—were all on the best and most satisfactory terms with their publishers. That there are plenty of men and women who will sign foolish or fraudulent agreements, no one will deny, but that they will be kept from doing so by a society instituted for their protection is more than doubtful, as Walter Besant also proved by citing the case of a woman who submitted an agreement to him and then signed it, though he showed her she was being cheated. Again, a publisher seldom relies upon his own judgment, but has his staff of readers, who consider the MSS. sent in to him. They often make mistakes, sometimes very serious blunders, but there is no special reason to believe that readers engaged by the Society, who are also paid for their services, will be more infallible.

The Committee count it a third step in advance that during the last year arrangements have been made "by which those who desire or consent to publish their books at their own risk and cost, may be enabled to do so without being charged more than the actual cost of production and a reasonable fee for the work done." It is only in very exceptional cases of benefit to the author to publish books in this manner. If he is a Ruskin, it is all right; and probably if successful authors had the time as well as the money to order the entire making of their books, their profit would be doubled. But when an author undertakes only the expense, and not the actual making, it is difficult to see the advantage gained in placing the matter in the hands of the Society, which does not itself manage the publication, rather than in giving it directly to the publisher; in both cases a fee is charged. Of course, there are, as the Report shows, "books which it is desirable to publish—good and useful books—which appeal to so small a public that the author, unless he can procure one of the universities or learned societies to undertake their publication, must himself be charged with the cost." But until the Society becomes its own publishing company, it is not easy to see how it can give greater help to an author in this plight than the large publishers, who are always glad to have valuable and learned works on their list of publications, especially when they can do so without themselves running any risk. As for the verses by young poets which it is impossible to get published except at their own charge, it is to be hoped the Society will not take any step to encourage their publication. Any man who writes passable verse has every chance to publish it in the periodicals of the day; if he cannot thus find a place for it, he may be pretty sure it is not of much account. Indeed, it may be said of all MSS., as a rule—there are, of course, notable exceptions—that to submit them to publishers and editors is a better test of their merit than to ask the advice of a society of which the author is a member.

Sir Frederick Pollock, in a short speech, seemed to think that, after all, a little common sense on the part of the author was more necessary than the opinion and advice of the Society. The want of business sense so often shown by men of letters he attributed to the fact that until our time it was thought to be beneath a *gentleman* to live by literature. In the eighteenth century those who did were looked upon as hacks. But, while he held that literature, like medicine and the law, is immeasurably above all other trades, he could not see why the literary man should not, like the doctor and the lawyer, have some regard to his purely business interests. Whether literature has gained by being made a profession, I think it would be extremely difficult for any one to decide; but, inasmuch as it has become a profession, I cannot but agree with Sir Frederick Pollock that, to regulate the relations between individual publishers and authors, what is needed is, first of all, common sense upon the part of the latter.

Other work which the Society proposes to do, and indeed has begun, seems much more within its proper scope. It is now preparing for publication

"a series of papers, varying in size from a tract to a small volume, on the following subjects:

"(1.) The Various Acts of Parliament which have Recognized and Protected Literary Property.

"(2.) The Growth of Literary Property and the Literary Profession in this Country.

"(6.) Literature and the Civil List.

"(7.) International Copyright.

"(8.) Equitable Publishing."

This series promises to be very interesting.

The Society also intends to start a syndicate of its own, which will receive MSS. from its members only, and place them, if possible, in newspapers at home and abroad. As the excellence and finish of the work will be considered, as well as its marketable value, it will be curious to follow the fortunes of the syndicate, and compare them with those of its rival literary agencies whose only standard of literary merit is one of dollars and cents.

The Society is hopeful about international copyright, and looks forward to the passing of the American bill, with some modifications, before this year has come to an end. Very little, however, was said on the subject; the members of the Society have already so well learned the difficulty of accomplishing their ends in their own country, that they begin to realize that abroad they are as yet powerless.

There was nothing else said or done in the meeting worthy of note. English authors are very dull when they come together in formal meeting. To the Committee of Management, who do the work, is also left the talking. One might think English authors were indifferent to their Society, were it not for the numbers who belong to it.

Correspondence.

NIE POZWALAM.

To the Editor of The Nation:

Sir: The Fiftieth Congress has vanished into the limbo of departed things (or, to speak correctly, into Sheol), and has left unenacted the International Copyright Bill. This is only one of its laches, and by no means the most important, but it affords a typical illustration of the condition into which our legislation is drifting.

We boast of being the most practical and hard-headed people on the globe or elsewhere, and Mr. Bryce has recently complimented us on our supreme political sense; yet we allow our Representatives to involve themselves in a series of parliamentary rules so intricate and absurd that a small group of members, or even an individual, can block the proceedings of the House and prevent the transaction of the most necessary business. The public looks on in somewhat dumb astonishment, unable to understand the methods, while painfully conscious of the result. The Copyright Bill, for instance, was a measure which had been for some years the subject of discussion in the Senate; it had thus been moulded into a shape which disarmed opposition, so that no open or organized antagonism ventured to show itself. The Senate passed it last May by about a three-quarters vote; it was favorably reported by the appropriate Committee of the House; no one openly opposed it, and it admittedly had two-thirds of the members in its favor. There was absolutely no politics in the matter: in the Senate the member in charge of the measure was a protectionist Republican, and in the House a revenue-reforming Democrat. Yet for five months at the end of the long session, and during the whole of the short session, its friends could never bring it before the House for consideration. Whenever the attempt was proposed, there was always some technical rule in the way, and a single member apparently had power to paralyze the whole legislative wisdom of the Union.

It requires no profound study of political history to foretell where this is to end if it is suffered to continue. To find parallel ingenuity in the art of misgovernment, we must look to the most unfortunate of the Slavonic races, whose fate affords a wholesome warning. Practically we seem to have reached the *liberum veto* of the Polish Diet:

"The power of one man," as Carlyle describes it, "to stop the proceedings of Polish Parliament by pronouncing audibly '*Nie pozwalam*, I don't permit'—never before or since among mortals was so incredible a Law. Law standing indisputable, nevertheless, on the Polish Statute-book for above two hundred years: like an ever-flowing fountain of Anarchy, joyful to the Polish Nation. How they got any business done at all under such a Law? Truly they did but little, and for the last thirty years as good as none. But if Polish Parliament was universally in earnest to do some business, and veto came upon it, Honourable Members, I observe, gathered passionately round the vetoing Brother; conjured, obtested, menaced, wept, prayed; and, if the case was too earnest and insoluble otherwise, the *Nie pozwalam* Gentleman still obstinate, they plunged their swords through him, and in that way brought consent. The commoner course was to dissolve and go home again in a tempest of shrieks and curses."

Now it seems to me that if we are to adopt Slavonic usages, we ought also to have recourse to Slavonic remedies. I would hardly recommend at first the application of the expeditious and decisive Polish method to our experts in the employment of the *Nie pozwalam;* but, if the rules of the House are too sacred to be tempered with common sense, we might commence with the expedients invented by the Russian peasantry, who, in the conduct of their *Mirs*, or communal societies, are hampered with the same facility of obstruction. They find, we are told, that the cudgel is a very efficacious argument in bringing about the requisite harmony of opinion. Another method, recommended by the experience of generations, is to bind the obstructive member hand and foot and lay him tenderly away in a dark corner, without victuals or drink. The introspective mood generated by this treatment speedily allays the ardor aroused by debate, and the instances are few in which the most obstinate are not won over.

I merely mention these as suggestions on which the ingenuity of our law-givers can doubtless improve. Meanwhile, I am sure you will agree with me that some remedy is imperative.—Very respectfully, Henry C. Lea.

Philadelphia, March 4, 1889.

HARINGTON AND SIDNEY.

To the Editor of The Nation:

Sir: Mr. Murray's citation of dates and authorities to show that Sir John Harington might have read Sidney's 'Apologie' in manuscript, is a case of carrying coals to Newcastle. The best evidence is found in Harington's own work. On the second page of his "Preface, or rather a brief Apologie of Poetrie," prefixed to his translation of the 'Orlando Furioso,' occurs the following sentence: "For as for all, or the most part of such questions, I will referre you to Sir Philip Sidney's Apologie, who doth handle them quite learnedly."

On page 7 (counting from the beginning of the preface—the pagination is wanting in the edition of 1634 which lies before me) is another reference to Sidney's work: "Sith as Sir Philip Sidney confesseth, Cupido is crept even into the Heroicall poems." With this compare Sidney, 'Apologie for Poetrie,' p. 53: "Even to the Heroical, Cupid hath ambitiously climed."

These citations are sufficient proof that Harington was familiar with the contents of Sidney's 'Apologie.' That he was also a shameless "conveyor" of Sidney's ideas cannot be doubted for an instant by any one who has read the two "Apologies" in close succession. A considerable portion of Harington's preface is mere paraphrase of Sidney, his indebtedness extending even to small matters of quotation and example. The parallel passages are too long to be reproduced, but those who are curious in the matter can satisfy themselves by making the following comparisons, the references being to Arber's reprint of Sidney's 'Apologie' and the edition of Harington cited above:

Harington, p. 4, Sidney, p. 51; H., p. 5, S., p. 59; H., p. 6, S., p. 27; H., p. 7, S., pp. 52–3; H., p. 8, S., p. 72.

The expression, "keepe a childe from play and an old man from the chimnie corner," occurs on page 7 of Harington's 'Apologie,' and is a case of downright stealing of one of Sidney's most felicitous passages—the more inexcusable because Sidney was then in his grave, and his 'Apologie' was known to but a limited circle of his friends. I have never been able to forgive Harington for this piece of audacious sneak-thievery, and I am wholly at a loss to understand why Mr. Lowell lent countenance to it. I feel disposed to arraign the latter for harboring stolen goods, if not for the greater crime of honoring a thing of shreds and patches at the expense of one of the finest prose-poems in the English language. Fred. N. Scott.

MORE ABOUT BENJAMIN VAUGHAN.

To the Editor of The Nation:

Sir: In your able review of the Messrs. Hale's 'Franklin in France,' contained in your issue, No. 1231, January 31, 1889, quotations are made from their work relating to Mr. Benjamin Vaughan which, to put it mildly, are in

rather slighting terms—such as, "one Benjamin Vaughan, then in Paris. The individual Vaughan. Mr. Bancroft writes him down as an inferior and casual agent. Mr. Hale regards him as a well-meaning man of very great vanity"—as if Mr. Vaughan had been some "casual agent" picked up by chance as a *pis-aller* by Mr. Jay.

Mr. Vaughan belonged to an old family of London merchants, in the days when merchants were not shopkeepers. The family was wealthy, and he devoted his leisure moments to the study of philosophic and scientific subjects. His friends and associates were men of the order of Dr. Priestley, David Hume, and Franklin. He was a member of the Royal Society. With scientific tastes, he naturally sought the acquaintance of Franklin on his arrival in London, and that acquaintance and friendship lasted until the death of Franklin. He was of great service to Franklin in many ways during his long official residence in England and France. It was principally due to his persuasion, together with that of Franklin's friend M. Le Veillard, Mayor of Passy, that Franklin was induced to write his Memoirs. The letters that passed between them show that Franklin had a very high opinion of the qualities of Mr. Vaughan.

Mr. Hale says (part 2, p. 145): "Without communicating his step to Franklin, Jay persuaded Benjamin Vaughan, in whom he seems to have had great confidence, to carry to Shelburne a verbal message," etc. This was in relation to granting a new commission, which Jay feared would be opposed by M. de Rayneval, an agent of the French Minister, who had gone to London "under an assumed name and took pains to conceal his departure." One would infer from this that Franklin was to be kept in ignorance of this move on the part of Mr. Jay. Mr. Vaughan at that moment was on a visit to Franklin, and it is not at all probable that Vaughan—an old and close friend of Franklin's—would not acquaint Franklin of the object of his departure. Franklin, a consummate diplomatist, probably did not want *to know too much*, as it always fell upon him to explain away, with tact, the lack of *bienséance* on the part of his co-commissioners to the Count de Vergennes. No man knew men better than Franklin, or was more capable of judging their capacities; he knew Vaughan of old date, and also knew his "personal merits and talents," and that he was a suitable man for the business he had in hand.

There were three brothers of the Vaughans, William, Benjamin, and John. John was much younger than his brothers, and, after the peace was declared, came to America under the auspices of Franklin; settled in Philadelphia, establishing himself as a merchant and importer of foreign wines and liquors. Like his brother Benjamin, he was fond of philosophic and scientific studies, and was for many years Secretary and President of the Philosophical Society of Pennsylvania, in Philadelphia, a society of which Franklin was one of the founders. He was the principal mover in the introduction of gas as a lighting medium into Philadelphia. He lived to a very old age, and was a man beloved and respected by all who knew him. He was a bachelor, living in apartments in the rooms of the Philosophical Society; and his breakfasts with a few friends were as famous in Philadelphia as the poet Rogers's were in London. I knew Mr. John Vaughan, and nothing delighted the old gentleman more than to talk of Franklin, and of the part his brother had taken in the negotiations for peace.

It is well known that Franklin's bitterest enemies were among his own countrymen: "unhappy indeed in their tempers, and in the dark, uncomfortable passions of jealousy, anger, suspicion, envy, and malice," as he says in one of his letters. Dr. Arthur Lee of Virginia, a fellow-Commissioner with Franklin and John Adams in Europe, was his principal calumniator; and John Adams had very little love or respect for him, but a great deal of "jealousy and envy." Mr. Benjamin Vaughan, known as a warm and attached friend of Franklin, may have reaped some of the "jealousy, envy, and malice" heaped upon Franklin.

As a specimen of consummate jealousy, envy, and egotism of one of Franklin's fellow-Commissioners, I will add the following letter of John Adams (a copy of which I have), which will serve to show, if the proof be needed, that in his judgment of his contemporaries he was not in the least conventional. The original letter is now in the possession of the Historical Society of Pennsylvania. It was addressed to a particular friend, who had written to Mr. Adams in July, 1806, paying him very high compliments. I believe it has never appeared in print. It runs as follows:

"QUINCY, August 23, 1806.

"DEAR SIR: In your letter of the 7th of July you flatter me with very high eulogies, and complete the climax of them with the opinion of Washington. For the future, I pray you to spare yourself the trouble of quoting that great authority in my favor. Although no man has a more settled opinion of his integrity and virtues than myself, I nevertheless desire that my life, actions, and administration may be condemned to everlasting oblivion, and I will add infamy, if they cannot be defended by their own intrinsic merit, and without the aid of Mr. Washington's judgment.

"The Federalists, as they are called by themselves and by their enemies, have done themselves and their country incalculable injury by making Washington their military, political, religious, and even moral pope, and ascribing everything to him. Hancock, Samuel Adams, John Jay, and several others have been much more essential characters to America than Washington. Another character, almost forgotten, of more importance than any of them all, was James Otis. It is to offend against eternal justice to give to one, as this people do, the merits of so many. It is one effectual extinguisher of all patriotism and public virtue, and throwing the nation wholly into the hands of intrigue. You lament the growth of corruption very justly, but there is none more poisonous than the eternal puffing and trumpeting of Washington and Franklin, and the incessant abuse of the real fathers of their country."

For further enlightenment upon the self-esteem and egotism of John Adams, see 'Sketches of Debate in the First Senate of the United States, in 1789-90 91,' by Wm. Maclay, a Senator from Pennsylvania, edited by Geo. W. Harris of Harrisburg, Pa., 1880.

Benjamin Vaughan may have taken but a minor part in the negotiations for peace. He, an Englishman, had been always a warm friend of the American cause; had influence in London, and was by no means an "inferior" or "vain" man. Franklin was not in the habit of forming close and enduring friendship with inferior or vain men. It was the friendship of superior people he sought.

Your obedient servant,

WILLIAM J. KERR.

93 AVENUE HENRI MARTIN, PASSY-PARIS,
February 22, 1889.

THE CORRECTION OF NEWSPAPER INACCURACY.

TO THE EDITOR OF THE NATION:

SIR: The letter on "Newspaper Inaccuracy" that appeared in the *Nation* of February 14, should be supplemented by some remarks on the obtuseness and the misstatements of newspapers when their own blunders are in question. Instead of dropping the matter, after thanking Prof. Hoover for calling attention to the erroneous statement in the *Times-Star* of January 18 that certain dates fell on Friday, that newspaper has published article after article making baseless slurs on Prof. Hoover's reputation for accuracy, and denouncing as false my statements in the *Nation*. We are told that such treatment is all that we could expect from a newspaper. If this be so, so much the worse for the newspapers. And yet is not the long-suffering American people partly to blame for these characteristics of its newspapers? If we demanded that newspapers should either deserve our confidence or lose our patronage, could we not do something to reform them? We do not demand infallibility—too many pretend to that already—but we do ask that newspapers use reasonable care to verify statements before publication, and that they be willing to correct mistakes without reviling those who call attention to them.

But note the procedure of the *Times-Star*. Upon searching my letter to find a handle for attack, the editors of that paper fell foul of the expression "verified the dates." By removing this expression from its context it was made to sound ambiguous, but when taken in connection with the rest of my letter, it could have no possible meaning but the one intended: viz., that Prof. Hoover verified whether or not the dates mentioned fell on Friday. As a mathematician, all that the Professor felt called upon to do was to set each date given on the right day of the week. In two instances, however, where the event actually fell on Friday though the date given did not, he generously gave the article credit for accuracy as to the main fact. In every other instance, he took the date actually given in the article as the basis of his computation, and thus left some historical blunders untouched. Now, the *Times-Star* editors, finding several such blunders in their own article, at once unloaded all said blunders upon Prof. Hoover, and accused him of being "an inaccurate corrector," thus metamorphosing their own mistakes into a weapon of attack upon him. He has replied by expressing his willingness to submit the accuracy of his work to a jury of experts.

In answer to the charge that there are "false statements" in my letter to the *Nation*, I have only to reply that the *Times-Star* editors have revealed no such statement, and that indeed they admit more than I care to affirm. Touching the inaccuracy of the article, they say on February 2, "inaccurate dates which we should have verified before using," and on February 23, "it proved on examination to be wholly unreliable." Any one who can count can ascertain that this original article assigns dates to just nineteen events, and any expert chronologist can readily show that only four of these dates really fell on Friday. By pointing out historical blunders, the *Times-Star* editors have themselves shown that the inaccuracy of their article was even greater than I indicated. Out of the nineteen dates, I only mentioned the seventeen belonging to the first six days of the week, because I thought that it would be obvious to any one who cared to inquire curiously into the matter that the other two dates fell on the seventh day. In compliance with the repeated requests of the *Times-Star* for a restatement of the case in the *Nation*, I cheerfully offer this explanation, hoping that my meaning is now so clear that even a *Times-Star* editor need not err therein.

EDWARD P. ANDERSON.

OHIO UNIVERSITY, ATHENS, March 4, 1889.

Notes.

Miss Alice C. Fletcher is engaged on a monograph of Omaha songs, the result of the observation of several years. In this work she has been assisted by Mr. Francis La Flesche, of the Omaha tribe. Between one and two hundred songs have been obtained from native singers and the music noted, which, having been repeated to Indians of the tribe, has been recognized and pronounced correct. An account of tribal ceremonies has also been obtained, such as will render the forthcoming work a complete picture of the life of the people.

J. B. Lippincott Co. will have the third volume of 'Chambers's Encyclopædia' ready this week. They will shortly publish 'The Queen of Bedlam,' by Capt. King.

The best contribution that we have yet seen to the Bacon-Shakspere controversy is a volume by Charlotte Carmichael Stopes, 'The Bacon-Shakspere Question Answered' (London: Trübner & Co.), of which we have received the second edition. It is an orderly statement, such as Shakspere scholars have hitherto disdained to make, of the comparative evidence, internal, external, and psychological, for the authorship of the plays; but any presentation of this, short of a folio, must be partial. In one particular, however, the book contains an original and interesting chapter of criticism. It appears that the author was led into the task by a study of the way in which Shakspere spoke of beer and wine; and this, which is a very elaborate examination, is included in the work, and set side by side with a similarly exhaustive account of Bacon's writings on the same subject. The result is, that the two men seem to have hardly any common point in their interest and observation in this special matter; Bacon illustrating, as a matter of course, the scientific, and Shakspere the humane spirit. These special monographs take up much space, and the remainder is well employed in a temperate and almost cold statement of things known—a branch of Shakspere scholarship in which the Baconians have not been shining lights. A history of the Baconian theory of the plays, including Mrs. Pott and the "cipher," concludes the volume. Perhaps it is as well that the case for Shakspere should be summarized, however dreary and foolish the Baconian delusion may appear; but the blow needed only to be struck to be crushing.

The New York Shakspere Society publishes the third volume of the Bankside Shakespeare, the text furnished the players in parallel columns with the first revised folio text; the subject of the present issue being "The Merchant of Venice." The introduction is furnished by William Reynolds, and is principally occupied with an examination of the law of the play, with a view to the Baconian-authorship theory. He traverses the well-known ground, already completely covered and sufficiently summarized in the Variorum edition, and concludes that Bacon could not possibly have fathered the law of the play. The text is printed with customary fidelity, so far as our examination has gone.

The fifth volume of the 'Henry Irving Shakspere,' edited by Frank A. Marshall (Scribner & Welford), contains "All's Well That Ends Well," "Julius Cæsar," "Measure for Measure," "Troilus and Cressida," and "Macbeth," the latter appearing out of its order. The general plan of the work has been already noticed, and it has not been departed from, the stage histories of the plays continuing to be useful summaries; the present volume has no striking features.

The "Canterbury Poets" edition of 'Selections from Crabbe,' by Edward Lamplough, comes accompanied by an excellent life of Crabbe, by T. E. Kebbel (London: Walter Scott; New York: T. Whittaker), in which he portrays the poet in somewhat harsher lines than it was fit for his son to draw in his life of his father. He corrects a few inaccuracies, but the more important of his contributions to the truth consist in a readjustment of the narrative. He suggests, for example, that the real meaning of the son's words, referring to Crabbe's life at Belvoir Castle—"when the conversation was interesting he might not always retire as early as prudence might suggest; nor perhaps did he at all times put a bridle to his tongue"—is that Crabbe indulged himself too freely, and at such times was betrayed into exhibition of his rougher manners learned in drinking with more vulgar companions. The character of Crabbe is not an attractive one socially, and as here presented it is harmonious with his works. The selection of passages in the companion volume could not easily be wrong, as many well-furnished critics have already determined the favorites; it makes a substantial addition to our literature of this sort, as few authors deserve sifting more than Crabbe, or better repay it with a pure residuum of original and individual genius of an interesting though modest order.

George Meredith, who is now being put through the paces of fame so energetically by publishers and critics, has arrived at one of the last stages of his journey in having a volume of selections made from his novels under the title of 'The Pilgrim's Scrip' (Roberts Bros.). These are represented as aphorisms, but they do not justify the name. He is an epigrammatic writer, and often gives that shrewd and eccentric turn to a phrase which makes it suddenly impress the mind; but these sayings fulfil only half the fine definition of Lord John Russell's, being "the wit of one," but not "the wisdom of many." They are mostly observations on life, and condensed rather in matter than in expression. They are, too, much less effective when detached than in the novels. Perhaps the awkwardness of his poetry to a eulogist could not receive better illustration than in the lame attempt to make a readable selection from it, with which this volume of excerpts closes. There is poetic thought in them, as there is proverbial philosophy in his prose; but he achieved poems and maxims with about equal rarity. There is a fatal defect in his power of expression.

A volume of selections from the works of Harriet Beecher Stowe, 'Flowers and Fruits,' arranged by Abbie H. Fairfield (Boston: Houghton, Mifflin & Co.), reminds us how deeply this author's works bear the stamp of the old New England life, and how closely sympathetic they are with the nature of the home-keeping people whom they have most delighted. Here one sees at a glance what gave both unity and popularity to her varied work, aside from the exceptional circumstances which made 'Uncle Tom's Cabin' a book for all the world. The contents are arranged topically under such captions as "The Inner Life," "Children," "Nature," etc.

Mr. Frederick Saunders writes rather for quiet book-lovers than for the public, and his last volume, 'Stray Leaves of Literature' (Thomas Whittaker), does nothing to change his audience. It betokens a leisurely mind, and only a leisurely reader will find it just in his vein—a smooth-flowing stream of pleasant talk about matters not far to seek in gentlemen's libraries.

Eleanor Kirk supplements her useful 'Periodicals that Pay Contributors' with a new thin volume of 'Information for Authors' (Brooklyn, 786 Lafayette Avenue), in which she gives excellent advice about the preparation and disposal of manuscripts, and the foibles of editors of magazines. It is of a nature that every tyro should know it before putting pen to paper for the press, and should be recommended as much out of kindness to editors as to aspirants.

An interesting contribution to the colonial papers of Virginia has been made by William Cabell Rives, LL.B., who edits with a preface the 'Journal of an Exploration in the Spring of the Year 1750, by Dr. Thomas Walker of Virginia' (Boston: Little, Brown & Co.). Dr. Walker was a Virginia patriot, connected by marriage with the Washington family, a companion of Washington in the perils of Braddock's defeat, a commissioner to negotiate with the Six Nations in 1768, and with other Indians at later dates, and usually in political office in his own State, often holding responsible stations. The expedition of which he kept a diary was undertaken when he was thirty-five years old, and covered a region now in the States of Kentucky and Tennessee. He was the first white man who has left an account of the wilderness in these parts. The journal shows the presence, apparently not rare, of buffalo and elk, and notices the outcropping of coal; its interest, however, is principally antiquarian. The knowledge which Dr. Walker gained appears to have been used in 'A Map of the British and French Dominion, etc.,' by John Mitchell, used in the peace negotiations of 1783. The diary, which is short, is an excellent picture of a hunter's exploring trip; all the better for being without adventure and without color—merely a day-to-day existence.

'Winter Sketches from the Saddle,' by a septuagenarian, John Codman (G. P. Putnam's Sons), takes us back to old modes of travelling in a double sense, since it carries us over the old roads as well as in the old saddle. The more interesting parts of the little volume have the flavor of antiquarianism, especially of the Revolutionary era, the hero being André; but besides these bits of local wayside history, there is in this book a breath of the old-country spirit, before the days of railroads, which makes it whole some.

'Systems of Education,' by Prof. Gill of the Cheltenham Normal College, England, is a reprint by D. C. Heath & Co. of the edition of 1876. It is a popular statement of some of the principal systems, most of them European, and, in our opinion, of very little use to Americans, who are perhaps too much flooded with educational literature just now.

'The Government of the United States,' by W. J. Cocker (Harpers), is a brief constitutional manual for use in public schools. It is doubtful whether the pupils in these schools are sufficiently mature to comprehend very well the principles and the operation of our complicated system, and if they are, we should be strongly inclined to recommend them to take up Mr. Bryce's first volume. The work of a master is almost always simpler and more intelligible, even to the young, than that of the ordinary expositor and commentator. Mr. Cocker's book seems to be very carefully prepared; he has followed good authorities, and his style is clear. His manual is perhaps as satisfactory as any of its kind, but it is necessarily limited chiefly to the enumeration of particulars, and only a teacher of genius could interest boys in such a mass of intrinsically dry facts.

When an article on "American Authors and British Pirates" was published in the *New Princeton Review* eighteen months ago, many

English writers were moved to indignant protest, and one of the accused firms went so far as to write a letter to the *Spectator*—we mean the firm of F. Warne & Co. This fact gives special piquancy to the following note, which we find tucked into the March number of *Longmans' Magazine*, apropos of Mrs. Deland's 'John Ward, Preacher':

"Messrs. Longmans & Co. are the sole authorized publishers in this country of the above successful novel. They pay a royalty to the author, Mrs. Deland, on every copy they sell. As the novel was first published in America, it is not copyright in this country, and Messrs. Warne & Co. have availed themselves of this fact to publish a pirated edition. Notice is hereby given to booksellers and the public that Messrs. Longmans' edition is the only one authorized by Mrs. Deland. Messrs. W. H. Smith & Son have refused to buy any copies of Messrs. Warne & Co.'s edition."

The Librairie Paul Monnerat in Paris announces Miss Alcott's 'Les Élèves de Jo, et ce qu'ils devinrent.'

Noticeable in these days is the multiplication of annotated foreign texts for school reading. We can do no more than report the titles of some of these: Molière's 'L'Avare,' edited by Prof. Schele de Vere, and the first of a series of "Classiques Français," published in this city by W. R. Jenkins; 'Petit Théâtre des Enfants,' being "twelve tiny French plays for children," by Mrs. Hugh Bell (Longmans); Lamartine's 'Jeanne d'Arc,' edited by the competent hand of Prof. Alfred Barrère, and furnished with a vocabulary (Boston: D. C. Heath & Co.), and the same author's 'La Bataille de Trafalgar,' edited by A. C. Clapin, with map and vocabulary (Boston: Carl Schoenhof); A. Dumas's 'Un Drame de la Mer,' likewise edited by Mr. Clapin and published by Schoenhof; Zola's 'L'Attaque du Moulin,' edited by F. Julien, who provides not only notes but grammatical questions, and English sentences suggested by the text for translation into French—an excellent plan (Schoenhof); Hector Malot's 'Capri et sa Troupe,' an episode from 'Sans Famille,' edited by Francis Tarver, and Montesquieu's 'Grandeur des Romains,' edited by Paul E. C. Barbier—both these in Hachette's "Series of French Classics," and published (with vocabularies) by Schoenhof. In German we have Schiller's "Jungfrau von Orleans," annotated by Benj. W. Wells, and 'Lessing's Prosa,' selections edited by Prof. H. S. White of Cornell for the Messrs. Putnam's "German Classics for American Students." We may also mention in this connection two manuals of 'Commercial Correspondence,' French and German, which come to us from the Messrs. Longman, and seem well adapted as models.

A pretty bound catalogue of books for sale by J. W. Bouton of this city is adorned with facsimiles of old title-pages and in other ways, but is most noticeable for the autobiographical introduction in which this veteran bookseller recommends himself anew to his patrons.

The first French theatrical annual to appear is that with the punning title, 'Paris sur Scène' (New York: F. W. Christern), prepared by M. Saint Môr, and most abundantly illustrated. The very clever sketches of scenes in the Parisian plays of the past year are the chief attractions of this volume; but the letterpress seems careful and honest, and the book is made more valuable by exactness in its dates, and by the insertion of full casts of the performers in the plays criticised. Reading 'Paris sur Scène' is a short cut to a summary review of French drama for the past year; and the chief impression left is, that there is a distinct revival of the purely comic drama.

M. Bodinier, who is attached to the Comédie-Française, organized in Paris, a year or so ago, a "Théâtre d'Application," where the pupils of the Conservatory might get practice in their art by acting two or three times a week. In the hall devoted to this useful purpose he has recently held an exhibition of portraits of actors and actresses, of dramatic authors and dramatic critics. Some two hundred-odd portraits in oil and water color, in pastel and black-and-white, were shown, and these are duly catalogued in a neat little pamphlet printed by Quantin. It is to be hoped that the collections of the Garrick Club in London and of the Players' in New York will some day be catalogued as thoroughly.

The announcement of the suspension of the *Moliériste* is confirmed in the February number, and with the number for March this useful and admirable special magazine will conclude at once its tenth annual volume and its career. M. Monval has done good service, and he deserves the thanks of all who love the great, sad humorist whose works are the glory of French literature.

The Leonard Scott Publication Society, 29 Park Row, New York, has reprinted as an "extra" from the February *Contemporary Review* the famous article on the "Bismarck Dynasty."

A recent Bulletin of the Paris Société de Géographie contains an account by M. Camille Douls of his remarkable journey in northwestern Africa during the year 1887. Disguised as a native, he landed alone on the west coast near Cape Garnet, several hundred miles south of Marocco, pretending to the people of that region that he had been shipwrecked. At first he was treated with great barbarity as a captive, but he finally won their confidence, and spent five months wandering with them amid the oases of the western Sahara. The independent, nomad Moors of the desert, he says, are of three distinct races, the aboriginal Berbers, Arabs, and negroes. The Oulad Delîm, into whose hands he fell, are unusually intelligent, speaking a pure Arabic founded upon the constant study of the Koran. They are monogamous, and treat their wives with the greatest affection and respect as the equals of the men. The girls share the education of the boys, learning to read and write with them, and consequently the women show an intellectual and moral elevation far beyond that of any other Moslem women. He makes the remarkable statement that their camels go "ordinairement" ten days without drinking; "en temps de sécheresse ils prolongent leur abstinence du double." M. Doubs made his way along the coast to Marocco, where his disguise was discovered and he was thrown into prison, but was released at the request of the British Minister, who chanced to be in the city. A map, constructed with great difficulty, many observations being taken under the pretext of finding the direction of Mecca, shows the course of the author's wanderings, together with the character of the country and the position of the wells.

The double number of the *Library Journal* for the first two months of the year is unusually interesting and valuable. Mr. Charles H. Hull's "Helps for Cataloguers in Finding Full Names" is a very serviceable list, whose elaborateness implies both wide knowledge and great painstaking. It is, of course, a guide not more to proper names than to biographies. It fills more than fourteen pages. Mr. Paul Leicester Ford has a first paper on the "Private Libraries of New York." There is a supplementary list of public libraries in the United States of 1,000 volumes and upwards, in which Massachusetts, as usual, takes the lead; and plans and elevations of the new National Library Building at Washington and the Mercantile Library Building at St. Louis accompany descriptions of these structures.

Miss Amelia B. Edwards, LL.D., who is to visit America next season, will deliver six lectures before the Peabody Institute in Baltimore, in December, on subjects of Egyptian exploration and Græco-Egyptian art, aided by lantern slides and illustrations. She is the first woman that has ever been invited to lecture before the Institute.

—The February *Shakespeariana* has an elaborate account of the four reproductions of the First Folio Shaksperian text which claim to be facsimiles. The first of these attempts, by Douce, in 1807, was a very meritorious work, and was at first believed immaculate. But its prestige faded when a mousing caviller came out with a list of three hundred and sixty-eight errata, "two grains of chaff in two bushels of wheat." He had sought well-nigh five months for this find, which he was only able to sell for a fresh copy of Douce's reprint. In this volume he fairly wrote out all the errata he had discovered, and thus made Douce's work absolutely perfect. There are now no spots on that sun. This very copy of Douce, with all the caviller's autograph corrections, a consummate flower, is now in the library of Horace Howard Furness in Philadelphia. Douce's work, of which only two hundred and fifty copies were printed, the writer in *Shakespeariana* declares to have "become almost as infrequent as a genuine First Folio, and, except in the larger libraries, to be inaccessible to the common student." This is exaggerating the rarity of the Douce edition. The ten thousand volumes in Asbury University by no means entitle it to be reckoned among "the larger libraries," but one of those volumes is Douce's rarity. That curiosity has been treasured for more than thirty years in the Asbury Library, which in 1880 was surpassed in the number of books by two hundred and twelve United States collections. The Douce Shakspere, with some thousand other volumes, came to Asbury in the little Indiana village of Greencastle, from the estate of Thomas Ford, an early Governor of Illinois, who died in 1851. This book was clearly a favorite of the Governor, who had it bound in red morocco; and if he never chanced to hold up a leaf to the light so as to bring out the vertical water-mark, "Whatman," he may have died happy in believing himself the possessor of a veritable *editio princeps*. Many Asburians did die in the same delusion.

—Mrs. Frances Hodgson Burnett has a forcible and moving letter in the *Critic* for March 2 on the shameless way in which any one who has written a good book or a good play must expect to be treated by the newspapers in this country. It is not customary for a person who has made himself so interesting to the public that the reporter feels it a duty to describe the minutest details of his life, and to invent them if he cannot discover them, to make any protest against such outrageous treatment; but Mrs. Burnett has reached the conclusion that patient endurance is perhaps not the best remedy. It is difficult to see how her appeal can fail to have some effect upon even the most obdurate publishers and reporters. At all events, that portion of the community which would like to lead a decent and self-respecting existence cannot but be grateful to her for having made it. How is this shameless intrusion upon the private life of a public person to be put an end to if not by appealing to the better nature of such of the offenders as have a better nature, and by stirring up feelings of abhorrence on the part of the public towards such of them as

have not? The excuse which publishers and reporters always make is, that the fault lies with the readers, who are willing to pay their money for such wares. It may be true that the receiver is as bad as the thief, but society does not undertake to exterminate receivers of stolen goods in order to prevent the crime of stealing. The readers of this objectionable literature are obscure in station and countless in number; it is impossible for the reformer to have any effect upon them. The publisher and the reporter are in plain sight and in full hearing; it is upon them that the reformer's weapons must be brought to bear. As Mrs. Burnett points out, the present state of things is so painful to the victims of it that many modest people will doubtless be prevented from becoming great authors or dramatists from fear of exposing themselves to the reckless fabulizing of the newspaper reporter.

—Sir George Trevelyan has lately reprinted some of his early pieces, under the title 'Ladies in Parliament.' One of the best-known of them, "Horace at the University of Athens," recalls an old Cambridge scandal. Sir George had been graduated Second Classic, and was looking forward to a Trinity fellowship. He failed of an election, and this was believed to be due to his having written the "Horace," which originally contained such lines as these:

> "The fellowships have gone, save one in three,
> In inverse ratio to the degree;
> And we expect next year a Junior Op.
> Will, by the aid of book-work, come out top."

These lines were cut out of the first edition, but became known in a way that Sir George explains in the following note:

"In the first edition the above four lines, the *dearest the author ever penned*, were suppressed at the last moment, and fresh matter substituted. But a thrifty bookbinder used the rejected pages to strengthen the covers of a certain number of copies; so that the reader could gratify his curiosity by the simple process of holding up the binding to the light. Few could be induced to believe that the author was not a party to this suicidal policy."

—For several years the functions of the National Board of Health in relation to epidemics have been transferred to and discharged by the Marine Hospital Service, whose ordinary duty is the care of sick and disabled seamen. It is in this way that the last annual report of the medical officer at the head of this subdivision of the Treasury Department contains an account of the yellow fever of 1888 in Florida. The report itself is for the fiscal year ending June 30, but it is dated October 24, and contains the history of the epidemic down to November 20. The disease held over at Tampa from 1887, having been introduced there from Key West, where it was imported from Havana. The statistics for the State do not appear to have been compiled, but in Jacksonville more than 4,600 cases were reported, with less than 10 per cent. mortality. This is so slight a death-rate as to excite the suspicion that many malarial patients were confused with these, unless, it may be, the negro population, for whom no separate statistics are preserved, contributed an undue proportion of light cases. The most valuable part of this volume of 400 pages (taken up, indeed, with many other matters than this disease) is a paper by Dr. Guitéras on the natural history of these epidemics. Dr. Guitéras, who has had special facilities for this study, does not believe that natives of yellow-fever countries have exemption from the disease, although this is not the common doctrine. He contends that their apparent immunity depends upon protection derived from attacks in childhood, generally unrecognized at the time. He also thinks that the specific cause may lie dormant in favorable situations, as foul latrines, for months, and that certain years, by their meteorological conditions, are more favorable than others for the development of the disease. He does not refer to the doctrine (and probably does not accept it) that, under favorable conditions of filth and temperature, micro-organisms ordinarily innocuous may, through multiple natural cultures, in a single season develop a virulence sufficient to give rise to the disease by exactly the reverse process from that by which the artificial cultures of the bacteriologists attenuate and render useful as preventives the virus of chicken cholera and of other infectious disorders. But the Floridian has doubtless more to fear from Cuba than from such transformations. Dr. Guitéras's paper is worth reprinting as a contribution to the permanent literature of the disease.

—When the great work of Professor Reusch of Bonn, 'Der Index der verbotenen Bücher,' was completed some years since, we called attention to its wonderful accumulation of facts illustrating almost every department of literary and religious history during the last three centuries. Since then he has not been idle. In 1886 he bestowed another valuable gift on students by publishing his 'Indices Librorum prohibitorum des sechzehnten Jahrhunderts,' a verbatim reprint of the Indexes which appeared in all the countries of Europe, from the early tentative lists of dangerous books to the Index of Clement VIII. in 1596. As many of these are among the rarest of bibliographical curiosities, it was a service of no little value thus to render them accessible. For a while Reusch's attention was diverted to a cognate subject by coöperating with the veteran Von Döllinger in producing the curious and interesting 'Geschichte der Moralstreitigkeiten in der römisch-catholischen Kirche,' the second volume of which appeared but a few months since. He has now resumed his previous labors with a reprint of the 1580 Index of Parma—a broadside of which but a single copy is known—and has accompanied it with exhaustive notes such as he alone could furnish. The whole series of these publications is indispensable to every student of modern spiritual and intellectual development. They are not books for the superficial reader, but no one who has enjoyed the assistance of their marvellous wealth of accurate details, rendered easy of reference by satisfactory indexes, will ever willingly be without them.

AN INDIA AND A CHINA MISSIONARY.

Stephen Hislop, Pioneer Missionary and Naturalist in Central India from 1844 to 1863. By George Smith, C.I.E., LL.D. London: Murray. 1888.

The Life and Letters of Samuel Wells Williams, LL.D., Missionary, Diplomatist, Sinologue. By his son, F. W. Williams. G. P. Putnam's Sons.

THERE has been a good deal of hot discussion in England upon the question whether the missionary enterprises of the Protestant churches have been successful or not. As regards India, more perhaps than any other country, nothing could be more superfluous. It is in Southern India that the Protestant missions have been most successful. There converts are numbered, not by tens or fifties, but by hundreds and thousands, and the reason of this is that in no other part of India is the spirit of caste so arrogant, so exclusive, so brutally oppressive as here. By the Brahmins, the lower castes were uniformly treated as a great deal worse than the beasts that perish. All the avenues of life were sealed up against them. They were regarded as the abject slaves of those above them; they lived upon offal and diseased meat; they passed their lives in hunger, cold, and nakedness; they could never hope to rise beyond the worse than bestial condition in which they were born. When the Protestant missionaries came among these forlorn and miserable outcasts, their words fell upon minds eager to listen, and they embraced Christianity literally by thousands. What has been the result? In all these Christian villages, in the place of the old degraded outcast population, we have thriving industrial communities, decently clothed, decently instructed, delivered from a servitude too frightful for any one to realize who has not witnessed it.

But while much has been accomplished, the present condition of these villages is only an earnest of what may be reasonably expected. The generation has hardly passed away which was redeemed from bestiality and savagery. For the full effect of this astonishing transformation we must wait for a future generation, entering, so to speak, from its birth, not only upon the Christian life, but upon the whole civilizing inheritance of the Western world. This levelling up of the lower castes is the one way in which the social regeneration of India is practicable; and clearly it could not have been set into motion except by religious societies acting independently of the State.

There is another aspect of missionary work in India which is wholly ignored by those who try it by commercial tests. Among the British in India, whether belonging to the official, mercantile, legal, or any other class, not one man in a hundred would enter the country if he could get his living without doing so. Speaking generally, we may say with very little exaggeration that all Anglo-Indians hate the country, hate the climate, and dislike the people. The one great object of their lives is to get out of the country as soon as they possibly can. Englishmen are charitable enough when resident among their own people, but in India there are only a few who think of exercising this virtue for the benefit of the natives. They come to the country, they grow rich, and then pass away, leaving no traces behind by which the people could recall their presence with a sense of gratitude. The Christian missionary relieves and mollifies the bad effects produced by this hard and unsympathetic type of character. He alone of all Europeans in India seeks for nothing from the people except that they should grant him a hearing. He alone comes among them with gifts in his hand, with a desire to benefit, not himself, but them. The good is really incalculable which has been effected in India by missionaries of the type of the German Schwartz, and by Carey, Marshman, Ward, and others who might be named. These have been mediators between the State and the people, moralizing the former and awakening the confidence of the latter.

The career of Stephen Hislop, the subject of the biography before us, is an example of this. He was a member of the Free Church of Scotland, a man possessed of no exceptional gifts or attainments, who went to India, driven thither by an earnest and single-minded desire to save its people from a degrading and vicious idolatry. The city of Nagpur, in Central India, was the starting point and centre of his labors. When, in the year 1844, he arrived there, this city and the province which bore its name were ruled by a Mahratta sovereign. The population of the city was largely composed of high-caste Brahmins, who enjoyed in a special degree the favor and protection of the Mahratta Court, and of fanatical Moslems. There had,

previous to his coming, been one or two feeble efforts at starting a mission, but these had died away, leaving no sign behind them, and Hislop may be regarded as the first Christian missionary who appeared among the people of Central India. The prospect before him was anything but hopeful. To the native Court, the Brahmins, and the Moslems he could not but be a disagreeable and unwelcome intruder. Nor was he otherwise regarded by the great majority of his own countrymen residing in Nagpur or the neighboring military cantonment. In those days, the curious belief still held possession of English minds, that the natives would patiently submit to any amount of injury and oppression so long as no Christian missionary was allowed to appear among them. True it was that these obnoxious personages had established themselves in a good many places without producing the popular outbreaks which had been anticipated; but this, so far from reconciling the laity to their presence, made them only more anxious to preserve the unvisited parts of India from the contamination of their presence.

Undaunted, however, either by indifference or open opposition, Hislop began his labors single-handed. The number of his converts was not great, but the earnest, charitable disposition of the man won the affections of the people. They sent their children in increasing numbers to the schools which he opened. They learned to converse openly and freely with him, so that his influence among them, and his knowledge of their veritable wants and wishes, made him an authority whom the British officials were glad to consult. In 1853, the State of Nagpur was incorporated with British India by Lord Dalhousie. In 1857, this and similar high-handed acts, combined with the grievous misrule which prevailed over nearly the whole extent of British India, produced their natural consequences in the great outbreak of 1857. Then it was that Hislop's philanthropic labors enabled him to render a service to the State and his own countrymen which went far towards the salvation of the Empire.

The population of Nagpur had witnessed with much resentment the loss of their independence; and the revolt of the Sepoy army seemed to invite them to make an effort for its recovery. They conspired with the native regiments cantoned in the neighborhood to rise at a given signal, murder the whole British community, and restore the old royal family to power. Had this design succeeded, it is absolutely certain that the Moslem state of Haidarabad, which is contiguous with Nagpur, would have followed its example, and British authority in the Madras Presidency would have ceased as completely as it had already in the northwest provinces, Oudh and Behar. But there was a certain Mohammedan of the name of Feiz Baksh, residing in Nagpur, whose children had been educated at one of Mr. Hislop's schools. He himself had been a frequent visitor at the missionary's house, and he could not endure the thought of allowing his friend and his family to be ruthlessly murdered without a word of warning from him. He revealed to Hislop the danger that was impending over him and his countrymen just in time for measures of precaution to be taken. The conspiracy was defeated and Southern India saved.

It was several years after the suppression of the mutiny that Nagpur, with two or three other large provinces, was formed into a separate government under the name of "Central Provinces." At this time, almost the only Englishman in India who knew anything of the people or the country in the more inaccessible parts of Central India was Stephen Hislop. Indefatigable in his work, it had been his custom, year after year, to traverse the country in all directions for the purpose of preaching in the villages. He found among the forests a large aboriginal population, the Gonds, whose language he was the first to reduce to written character, and of which he compiled a grammar and dictionary. In these wanderings he slept frequently in the villages where he had been preaching, partaking of the same food as the villagers had prepared for themselves, and conversing with them on a footing of social equality. No official, even if he desired, could have imitated him in these practices. A native has far too great a distrust of the powers that be to open the secret places of his mind to them. A missionary of the type of Hislop—one who is neither official nor policeman, nor trader nor planter—is the only European who can ever learn anything about the native as he really is—the genuine, unsophisticated article.

Mr. (now Sir Richard) Temple, who had been appointed first Chief Commissioner of the Central Provinces, had the wit to see the value of such a helper in the work he had been ordered to do. He sought his advice and assistance in the working out of every project for ameliorating the condition of the people. For the last few years of his life, the once friendless and forlorn Scotch missionary became, without official rank or salary, without effort or design of his own, a power in the state. He was accidentally drowned at the early age of forty-three. "He had," writes Sir Richard Temple, "become a shining light, a power for good; and, had he lived, he would have become an instrument of incalculable benefit to the people. It is sad to think what lofty hopes, what bright promises, were buried in his grave."

Of sturdy Welsh and New England stock, Samuel Wells Williams, the oldest of fourteen children, was born at Utica, N. Y., September 22, 1812. More dangerous than any of his perils in China, or on Perry's ships in Japanese waters, was his first infantile adventure. Owing to his mother's ill-health, he was put in the care of a maiden aunt, who, after the fashion of the time, carried a muff not much smaller than a beer-keg. During a sleigh-ride from New Hartford to Utica, Samuel, the baby, was stowed away inside the muff, which, during a capsize of the sleigh, was thrown out in the snow. Extricating herself and vehicle, the worthy spinster drove on, mindful only of her own safety. On coming to remembrance of the object of her visit, she discovered the loss of her muff and its contents. "'Shall I go back?' she queried. 'Yes, for God may have something for him to do; moreover, I cannot spare the muff.'" So the future sinologue was recovered along with the hand-warmer. He lived to thank his aunt for many other favors.

What book-knowledge the boy received was at village schools—the Utica High School and the Polytechnic Institute at Troy; in which, along with a fair English education, he obtained a good grounding in the natural sciences. When twenty years old, he was appointed by Dr. Rufus Anderson to go out as missionary printer to China. In those days the American Board of Commissioners for Foreign Missions was a union society, supported by Christians of different denominations, instead of being, as it is now, a Congregational corporation at war with Congregational polity. In the freshness of its first energy, theological questions were of less importance than practical missionary work. After six months' hasty apprenticeship in all the departments of book-making, Williams sailed from Boston in October, 1833, in the American ship *Morrison*. He arrived at Whampoa, and, through the great fleet of East India merchantmen which lined the river for three miles or more, was rowed up to Canton. Thenceforth, for forty-two years, he made this land the field, and the Chinese people the object, of his labors. From the first he wisely guarded his health, taking regular exercise and recreation, being all the more able thereby to perform an amount of labor that surprised most foreigners. He made two visits to the United States, during the first of which he delivered lectures on China to raise a "type fund" to pay for punches and matrices for his font of Chinese metal type. These lectures, when written out, were published in book form, and for thirty years the sale of the resulting brace of volumes, 'The Middle Kingdom,' was steady, though never large.

Three times he entered Japanese waters, twice abiding on land. In the *Morrison* in 1837, he was fired on, and, unable to disembark the shipwrecked Japanese, returned with them to China, learning their language, and translating into it the Gospels. When Commodore Perry succeeded the much-abused Aulick—the victim of lying tittle-tattle and the mysteries of the Washington naval office—Dr. Williams was appointed interpreter to the expedition. Like most foreigners essaying Japanese, the word *keredomo* was very often on his lips, and the native interpreters nicknamed him "Mr. But." Later, in 1872, he again visited the country, laughingly telling the writer of this review that he was very glad he declined Commodore Perry's desire that he should write a book on Japan, notwithstanding the fact that usually a man can tell the public more about a new country when his impressions are fresh and he doesn't know much about it, than he can after knowing more. Dr. Williams's journal, kept during the negotiations, is of great value, and the Commodore in his folio volume made very liberal quotations from it. Dr. Williams and the Commodore always got on well, except that the sailor's profanity was very distasteful to the scholar. Characteristic of this guileless man was his repayment into the missionary treasury of the entire amount of his salary as interpreter received from the United States Government.

The mechanical and linguistic difficulties surmounted, and the progress made, by this industrious printer, during the twenty-five years' existence of the Mission Press at Canton and Macao, are clearly set forth in the letters and journals from which the biographer has so liberally made extracts. Most of the printer's work was of the sort intended to make the Chinese and Westerners acquainted with each other's speech and thought. The total output was 38,000 volumes, not counting pamphlets. The press earned by its publications and jobs $12,000 over and above expenses. Of the valuable *Chinese Repository*, mostly edited and largely filled by Dr. Williams, 23,000 copies were printed. When, in 1857, the printing office was totally consumed in the incendiary fire by which the Chinese destroyed also the factories, and caused for a while a total cessation of trade, Dr. Williams entered provisionally upon his services as American Secretary of the Legation of the United States, which, as it turned out, he served until 1877. To the temporary sojourners in the Middle Kingdom sent out from Washington, and acting as American envoys, the services of so experienced a scholar and diplomatist, in whom the Chinese reposed the highest confidence, were invaluable. On returning to the United States in 1877, Dr. Williams revised his great work on China, filled the chair of Professor of Chinese

at New Haven, and remained to the end of his days the courteous gentleman, genial friend, helper of the poor and needy, cultured scholar, and devout Christian. He died on February 16, 1884.

The biographical volume by his son is a handsome octavo of 490 pages, on good paper, with wide margins. The style is clear and pleasant, and the text interwoven between the letters and extracts is sufficient in quantity and quality. A good steel portrait of Dr. Williams's Hebrew-like countenance, and a capital index, complete the equipment of this monument which filial love has raised in honor of a useful and beautiful life. In character, Dr. Williams was a man of stainless purity, generous, sympathetic, and honored by all. The moral force of his personality is still unspent, and his writings in English and Chinese will continue for generations to assist in the solution of the problem resulting from the contact of a progressive with an ultra-conservative civilization. In his learning he was a scholar of the old-fashioned sort, largely lacking in the important critical faculty. No one is likely ever again to attempt an encyclopædic work on China such as he wrote. With the new learning in sinology represented by Mayer, Terrien de la Couperie, and the brilliant and possibly flippant young scholars of the North China Asiatic Society, he had no patience or sympathy. With the "new theology," so called by him, he had less either of understanding or appreciation. He was, in his limitations, a man of his age; in character, he was a man of all the ages.

ROGERS'S ECONOMIC INTERPRETATION OF HISTORY.

The Economic Interpretation of History: Lectures delivered in Worcester College Hall, Oxford, 1887–1888. By James E. Thorold Rogers, Professor of Political Economy in Oxford, and of Economic Science and Statistics in King's College, London. G. P. Putnam's Sons.

THIS volume comprises twenty-three lectures given before the students of Oxford University. It may be remembered that some twenty years ago Prof. Rogers was deprived of a lectureship in Oxford on account of his then advanced views on industrial questions, or, as he himself states the case, "because he traced certain social mischiefs to their origin"; and the lectures now printed comprise, we understand, his first public utterances upon being restored to his former position as a member of the instructing body of that venerable institution. It is certainly proof that the world moves, and that rapidly, if the conservative views which find expression in these lectures could, twenty years ago, have caused a University instructor to have been deprived of a lectureship.

The title of the book is misleading. A definite and somewhat narrow meaning is ordinarily attached to the phrase "economic interpretation of history." By it one understands that the flow of national life is to be explained in the light of economic events. Such an interpretation must of necessity be systematic in its arrangement, orderly in its unfolding, and comprehensive in its treatment. It ought to show, to use the words of our author, "how very often the cause of political events is economical." It ought to leave the impression, as our author in another place declares, that to omit or to neglect these economical facts "is to make the study of history barren, and its annals unreal." It cannot, of course, be asserted that this book is of no assistance in the interpretation of history, for its pages are replete with economic facts of all sorts; but it is certainly within the bounds of truth to say that the lectures do not present an economic interpretation of history in the broad and scholarly meaning of that phrase. They meet much more nearly the requirements of an historical interpretation of economy, although that title would not accurately describe them. What Prof. Rogers has here done, and done excellently well, is to bring his immense store of economic knowledge, gathered from an exhaustive study of English industrial life, to the support of opinions held by him as an economist, and of conclusions entertained by him as a statesman.

It may not be out of place to support this view of the work before us by a closer study of one or two of the chapters which it contains. Its scope is indicated by the following headings, taken at random from the table of contents: "Diplomacy and Trade"; "The Distribution of Wealth in England at Different Epochs"; "The History of Agricultural Rents in England"; "The Origin and Progress of Pauperism in England"; "Historical Effects of High and Low Prices"; "*Laissez-Faire*: Its Origin and History," and others of the same sort. Let us consider for a moment the method of treatment for the two last mentioned. In a discussion of the historical effect of high and low prices there is certainly clear sailing for one who desires to give an economic interpretation of history. It is only necessary to state the facts of fluctuating prices and to trace their effects on the development of national life. But Prof. Rogers does not follow this line of presentation. Beginning his discussion with a statement of Gregory King's well-known law of prices, he expands that law into five general principles, and supplements these principles by three historical events which work as potent causes in the fluctuation of prices. The principles are as follows: (1.) The price of any article rises or falls by a different ratio from that indicated by the ascertained amount of its deficiency or surplus. (2.) The operation of the above law is always most dominant in articles of prime necessity. (3.) If in the scarcity or plenty which prevails there are several articles that can be used interchangeably, the greatest rise of price will attach to the article ordinarily the cheapest, and the greatest fall in price to the article ordinarily the dearest. (4.) For goods whose consumption is voluntary, an excess of supply will be followed by a fall in price to the present cost of production, but an excess in demand will, through a rise in price, be followed by unusual activity in trade. (5.) A rise of prices in the necessaries of life will not tend to increase the amount of employment, but a rise of prices in articles of voluntary consumption will increase both profits and wages. The three historical events which work as factors on prices are: movements in the supply of gold and silver, diminished cost of production resulting from inventions, and diminished cost of transportation.

Now, says our author, "if we are able to grasp the five general laws of prices which I have given, . . . and the three causes, . . . we shall be on the way to interpret the facts past and present which I have to lay before you." This is certainly promising. It sounds quite plausible, and yet the reader who comes to this chapter expecting to learn from it the effect of fluctuating prices on the growth of society, will surely be disappointed. The truth is, movements in prices have exerted greater influence upon the fate of nations than the ambition of kings or the reasoning of philosophers, and to trace their subtle influence cannot be evaded by one who assumes to write "an economic interpretation of history." But Prof. Rogers does not conceive this to lie within the task he has undertaken. There is scarcely a fact mentioned in this chapter that is not an economic fact. The author makes no attempt to mark out the broader line of study. His sole aim seems to be to support his laws of prices by reference to history. He is contented if he can say, "The laws affecting prices are illustrated to the full." His treatise is a treatise in economy rather than in history.

Our disappointment is of the same sort when we turn to the discussion of "*Laissez-faire*: its History and Origin," although in this case it is the practical statesman and not the practical economist that directs the discussion. There is perhaps no subject in the entire range of scholarly research more worthy of profound investigation than that of the historical origin of the doctrine of *laissez-faire* and its influence on modern social relations; but instead of outlining such a treatment as this, which is, of course, all that could be done in a single lecture, our author presents to us a homily on state interference, and illustrates his conclusions by running comments on certain laws and reforms of the nineteenth century.

It may appear to some that this review is captious in its criticism; it has not, however, been written in that spirit. The important services of Prof. Rogers to the advancement of economic history have been frequently recognized on this side of the Atlantic. It is largely through the study of his writings that American scholars have come to appreciate the grandeur and the importance of an economic interpretation of history; and it seems almost like disloyalty to the master who has taught us so much, to admit that this bundle of lectures properly suggests the scope of such a study. And it should be remembered also, in this connection, that one duty of a reviewer is to guard readers against the purchase of books they do not want, but which they are tempted to buy on account of an inviting title. It is, therefore, incumbent upon us to say that if one is searching for an economic interpretation of history in the broad and philosophical sense of that term, he will not find it in this volume; but if, on the other hand, one desires access to a fund of useful information pertaining to the industrial life of the past, there is no book, so far as we know, to compare with this one. It could not have been written except by a man of Prof. Rogers's experience in life. It speaks of the House of Commons as well as of the professor's chair. It shows its author to be a man of affairs as well as a close student of industries. Its pungent comments on past events, its trenchant criticisms on the actors in history, as well as its common-sense comments on passing events, make this collection of essays worth the appreciative attention of every intelligent reader. The book is a full book in every sense of the word because the life of its writer has been a full life. Under another title it would receive our highest commendation.

One sentence in the volume before us has been severely handled by the protectionist newspapers in this country, viz.: "The protectionist tariff of Mr. Morrill was in great part, as I have heard alleged by eminent American statesmen, the price paid for the allegiance of the manufacturing East." This is erroneous, of course. Prof. Rogers was probably told, and has only vaguely remembered, that the Chicago Convention of 1860, which nominated Mr. Lincoln the year before the war, in its anxiety to secure the electoral vote of Pennsylvania, adopted a resolution which the politicians of that State construed to mean protection, although the language employed was not very

clear. "The manufacturing East" (by which term we commonly mean New England) was at that time inclining to free trade. Certainly her "allegiance" needed not that any price should be paid for it.

RECENT LAW BOOKS.

THE steady growth in the volume of the law is illustrated not only in the constant accumulation of reports and statutes, but in the growth in bulk of the text-books which comment upon and discuss these. Mr. James W. Gerard's well-known and excellent treatise on the 'Law Applicable to Titles to Real Estate in the State of New York' (Baker, Voorhis & Co.) originally appeared twenty years ago in a little volume of four hundred pages; the second edition, published only four years later, contained nearly eight hundred. After a lapse of fifteen years, the present revision appears, containing nearly a thousand, and yet no conveyancer or lawyer at all familiar with the subject will say that there is a page too many. The revisers have throughout, we believe, had the assistance of the author's supervision, so that the work is his as much as ever, a fact which, to those who know his thoroughness and keen professional sense, is an additional warrant that the work is well done.

The book has one feature which for practical purposes is decidedly important—it is confined to, and purports to give only, the law of a single State. There are very few heads of the law which can be treated in this way. The writer on Contracts, on Evidence, on Damages, on Bailments has to draw for his material upon every quarter of those portions of the globe which have inherited the common law. The conflicting statutes and contradictory decisions of different jurisdictions make it often difficult for him, and sometimes impossible, to arrive at and state settled principles. Mr. Gerard was fortunate in a subject which was not hampered in this way. Real-estate law is with us peculiarly local. Titles are nothing if not local. Consequently, if Mr. Gerard's book is chiefly of interest to the New York lawyer, it is to him of the greater value for that very reason. In tracing the history of a doctrine or the interpretation of a statute, he is not perpetually distracted from the local beaten track by paths and by-ways which lead off to the bogs and morasses of remote or alien jurisdictions; and at the end of his investigation he has no doubt that he has obtained that great desideratum of the practising lawyer—a clue to a knowledge of the law *as it is*. A very large proportion of this book is of course statutory. For this and other reasons it has long been a *vade-mecum* for the New York conveyancer. Its strength lies rather in the completeness with which it brings the cases into bearing upon the local statutes than in any other feature.

The American State Reports, vols. i and ii (San Francisco: Bancroft-Whitney Co.), begin a new series of those selections from the law reports of this country, accompanied by annotations, which have proved very useful and acceptable. This one is edited by a practised and well-approved hand, Mr. A. C. Freeman; his notes add to the value of the books—such notes, for example, as those on the "Police Power of the States," and the sale of "Futures" in volume i, and on "Burglary," and the summary jurisdiction of courts to punish for contempt, in volume ii.

He who has the time and money and shelf-room to spare for them will find nothing so good as that remarkable and complete series of the reports of all the courts of last resort in the country—including also the decisions in the lower Federal Courts—which the West Publishing Co. supply. But not every one can afford forty dollars a year for that. There will be many who prefer to obtain for twenty-four dollars the six stout volumes a year of such a series as this of the American State Reports, with the fuller apparatus of notes which it supplies. In one way or another, it is getting to be almost essential that lawyers should explore widely the reports of other States than their own; and that is good, for it will tend to improve and unify the law of our States.

In the volume entitled 'Table of Cases and Index to the Notes in the 160 Volumes of American Decisions and American Reports' (San Francisco: Bancroft-Whitney Company), those who possess the two series preceding that of the American State Reports above mentioned, will find an important key to the convenient use of them. Indeed, the "Index to the Monographic Notes," arranged according to the subjects discussed, will prove worth having for any one who has merely access to these volumes in a library.

Mr. Wm. C. Cochran's 'Students' Law Lexicon' (Cincinnati: Robert Clarke & Co., pp. vii, 332) is a compact little book, likely to be serviceable to students. It has very good and full appendices, giving explanations of such abbreviations and references as are usually found in law books, and also a collection of foreign law maxims and phrases, with translations. The definitions appear to be mainly accurate and neat. Two criticisms might be made: (1) that it is not correct to describe the *præcipe quod reddat* as a writ commanding *the defendant* to do a certain thing; and (2) that the author, in describing the year-books, leaves his reader ignorant that there are now five printed volumes of an earlier reign than that which he names as the earliest.

The second volume of 'The Anglo-Indian Codes,' edited by Whitley Stokes, D.C.L. (Oxford: Clarendon Press; New York: Macmillan), is entitled "Adjective Law," and deals with the Code of Criminal Procedure, the Code of Civil Procedure, and the Evidence Act. Each is preceded by an introduction, giving its history and a general idea of its contents. In foot-notes to the various sections, the editor gives the rulings of the courts thereunder, together with comments of his own when necessary. The two volumes of which this is the second, the first dealing with "Substantive Law," will be of great use to those having a practical interest in the codification of the law.

Mr. Charles R. Miller's 'Law of Conditional Sales' (Cincinnati: Robert Clarke & Co.), a volume of 196 pages, 66 of which are appropriated to an index, while the subject indicated by the title of the book occupies only 62 pages, is not a book which a lawyer in a position to consult any late American edition of Benjamin on Sales need refer to.

'The Law of Landlord and Tenant,' by H. L. Gear, and 'The Law of Wills,' by Charles Fisk Beach, assisted by Edwin E. Pratt—both published in San Francisco by the Bancroft-Whitney Co.—belong to the "pony series," and are evidently the result of patient and conscientious work. They will be found to be very useful handbooks to have on one's table, though they cannot take the place of the larger treatises. Typographically, nothing can be said in their favor.

The first edition of Abraham Clarke Freeman's 'The Law of Executions' (San Francisco: Bancroft-Whitney Co.) is so well known to and so highly esteemed by the legal profession that any extended notice of the present edition is unnecessary. The author has not confined himself to collecting cases relating to questions treated in the first edition, but, besides adding much new matter concerning executions as a remedy for enforcing common-law judgments, has treated the question of enforcing decrees in equity, and has added two entirely new chapters relating to Chancery sales. Mr. Freeman has done his work conscientiously and well.

Le Marquis de Jouffroy d'Abbans, Inventeur de l'Application de la Vapeur à la Navigation. Par J. C. Alfred Prost. Paris: Ernest Leroux. 1889.

M. PROST'S work is an elaborate attempt to vindicate for the Marquis de Jouffroy the honor of the first application of steam to navigation. Excepting only as regards Jouffroy himself, it contains few facts not already well known. After a very long account of the ancestry of the Marquis, we have some details of his early youth, not without interest, and going to show that his taste for mechanics was developed at an early age. At fourteen he became one of the pages of the Dauphine; at twenty he entered the regiment of Bourbon as sub-lieutenant. The account of his early years is followed by a chapter on the history of the various projects for the application of forces other than that of the wind, in moving vessels. We need notice here only the fact that in 1737 Jonathan Hulls in England took out a patent for vessels with paddles to be moved by Newcomen's engine. There is no evidence to show that this plan was ever actually put in practice, but it clearly appears that, after the capital improvement made by Watt in 1765, the idea of a possible application of steam in navigation was widely entertained, and that the age was ripe for the invention of Jouffroy. In 1772 an association of persons interested in the problem of steam navigation was formed in France. It consisted of the Marquis Ducrest, the Count d'Auxiron, the Chevalier de Follenay, the Count Jouffroy d'Uzelles, uncle of the inventor, and others of less note. This society constructed from the plans of D'Auxiron a steam vessel which was launched upon the Seine in 1773, but which foundered near Meudon, leaving no record of its success or failure.

D'Auxiron died shortly after, and a new association was formed, consisting of his heirs and of Ducrest, Jouffroy the inventor, and Périer—the last an engineer at the head of a large iron-foundry. This association obtained from the Minister Bertin the promise of an exclusive privilege of steam navigation such as had been accorded to D'Auxiron, provided that Jouffroy's plans should be approved by the Academy of Sciences. Serious differences at once arose between Périer and the young Marquis. Périer launched upon the Seine a boat with a single-acting engine which failed completely. Jouffroy then left the association and set out for Franche-Comté to attack the problem alone. He selected the small village of Baume-les-Dames as his place of work, and in June, 1776, his first boat was launched. It was forty feet long and six feet wide. In place of paddles it had a system of oars articulated together, devised in 1760 by Genevois, an ecclesiastic of Berne. This vessel navigated the river Doubs in June and July of 1776. Jouffroy soon recognized the defects of his first vessel, and applied himself at Lyons to the construction of a second, which was completed in 1783. This was forty-six metres in length and four and one-half metres in breadth. It had paddle-wheels, could move against the current of the Saône, and for sixteen months plied between Lyons and Macon.

Jouffroy applied to Calonne, Comptroller-

General of the Finances, for an exclusive right of steam navigation. Calonne referred this request to the Academy of Sciences, which named as members of a commission the Abbé Bossut, Cousin, and Périer, the engineer and rival of Jouffroy. At the instigation of Périer, as appears probable, the Academy required new experiments, and Calonne declined to grant the privilege asked for unless Jouffroy would construct a vessel capable of transporting 300,000 pounds against the stream. The "concession" would then be granted for fifteen years. There seems to be little doubt that Jouffroy's defeat was due to the jealousy and malice of Périer. In 1784 Jouffroy, who was ignorant of Périer's feeling towards him, made overtures to his enemy to construct a double-acting steam engine of which he had prepared plans and drawings, as well as a model on a scale of one-twenty-fifth. Périer wrote in February, 1785, that such a machine would cost one hundred thousand livres, and that he would undertake it if the company which Jouffroy had formed would raise that sum. Jouffroy, whose finances were utterly exhausted, saw that the case was hopeless. On the breaking out of the Revolution he joined the Royalist army, but, after the peace of Luneville, returned to France. To obtain materials for his work he pulled down part of his château, but it does not appear that he constructed another vessel at that time.

In 1806 he returned to Paris, but of the next ten years of his life we have no details. In 1816 Jouffroy constructed a new vessel, called the *Charles Philippe*, after the Comte d'Artois. This also appears to have been a success, but our author gives us no specific account of its performance. Soon after, a powerful company formed at Paris openly took up the steamboat as the invention of Fulton; and Jouffroy, completely ignored, returned to the province to continue his work in poverty and neglect. A vessel called the *Persévérant* was, however, constructed at the expense of a new company. The Parisian company succeeded in preventing the necessary subscriptions to the capital of its provincial rival, and Jouffroy at last saw that the struggle was vain, and retired. After years of poverty and neglect he was admitted to the Hôtel des Invalides, where in 1832 he died of cholera. The honors which were denied him during his life came at last. In 1884 the Municipal Council of the city of Paris decided that a street should bear his name, and on the 17th of August of the same year a statue was erected in his honor at Besançon.

M. Prost's work has evidently been a labor of love. It is certainly a valuable contribution to the history of steam navigation, but to one who seeks only the cold facts upon which to form a judgment, it is very hard reading. We have to wade through page after page of rhetoric and sentiment to get at details which are not always given with the necessary fulness and accuracy. But the case of the inventor is, on the whole, well if not impartially stated. M. Prost gives extracts from letters of Fulton, which are interesting and valuable if perfectly authentic. In 1802 Fulton launched upon the Seine a small steam vessel which, according to Jouffroy, was a copy of his own. In one of the letters referred to, Fulton says that if the honor of inventing the "pyroscaphe" belongs to any one, it is to Jouffroy. In another letter he says, according to our author (for the passage is not cited verbatim), that he himself has invented nothing. It is to be regretted that these letters are not published in full.

Whether we are to consider Jouffroy or Fulton the inventor of steam navigation will depend upon what we mean by invention. Jouffroy firmly grasped an idea which was not his own—or at least not new—carried out that idea in practice, basing it upon correct scientific principles, and yet failed to become the true introducer of the system, though he devoted to it the peace and happiness of a long life. Fulton also took up an idea which was not new, and carried that idea to a successful permanent application, in the face of many obstacles. With the experiment upon the Hudson in 1807, the era of steam navigation began. The no less successful experiment on the Saône in 1783 led to nothing. In any case, the place of Claude François Dorothée de Jouffroy among great inventors is secure.

Un Pèlerinage au Pays d'Évangéline. Par l'Abbé H. R. Casgrain. Deuxième édition. Quebec. 1888. 8vo, 544 pp.

THERE is more in this book than its fanciful title imports. The author seems to have been thrown into a state of intense chronic excitement by the two chapters on the Acadians in Mr. Parkman's 'Montcalm and Wolfe.' At least, ever since their publication in 1884, he has been writing books and articles against them. He has chosen to make the question a national and religious one, and hence the remarkable heat with which he has pursued his task; a difficult one, in view of the awkward circumstance that Mr. Parkman not only stated unwelcome truths, but proved them by unanswerable French and Catholic evidence. Moreover, in 1886 Sir Adams Archibald, late Governor of Nova Scotia, read before the Nova Scotia Historical Society, of which he is the President, a paper on the same subject, written in a spirit equally just and humane, in which he expressed the same conclusions as those of Mr. Parkman, and gave his reasons for them.

Here was an added stimulus to the active pen of Abbé Casgrain, who had already published a series of articles in a French Canadian journal, and printed them in a volume under the title given above. Then followed two or more papers which he read before the Royal Society of Canada; then another series of articles running for a year through the numbers of a Canadian review; then the same articles with some changes and additions, printed in a second and enlarged edition of the 'Pèlerinage'—that goodly octavo of 544 pages which is the subject of this notice—the whole forming a vast and heterogeneous monograph, backed by a prodigious quantity of documents gathered in Canada, Nova Scotia, France, England, and the United States. These documents have also been printed, along with a profusion of notes and comments; and the whole amazing array of letter-press is set in motion to overwhelm the two chapters which are the head and front of the offending. Clearly, the sense of humor is wanting in the mind of the fervent author. If every subject of American history were treated on the same scale in proportion to its importance, some of them would fill whole libraries, and the world could not contain the books that would be written.

It is curious that after all this immense preparation Abbé Casgrain has not ventured to attack the allegations that have so distressed him, but has only railed at them from a distance. The position of Mr. Parkman and Sir Adams Archibald is this: They declare that the removal of the Acadians was an act too harsh and indiscriminate to be justified, and they do not attempt to conceal the cruelties that attended it. At the same time they show that the story has two sides; that the sufferers were victims as much of Frenchmen and Catholics as of Englishmen and Protestants, and that the government of Louis XV., through agents civil, military, and ecclesiastical, intrigued to stir up the Acadian subjects of the British crown to revolt against it in time of peace; that these intrigues were attended with terrorism and cruelty to the Acadians themselves, and treachery, outrage, and murder to the English settlers, and that they produced at last in the Acadian population a state of things which, in the words of Mr. Parkman, "made some act of force on the part of the English a necessity"; that, in short, without these intrigues the removal of this unfortunate people would have had neither reason nor pretext, and therefore would not have taken place. Mr. Parkman proves his statements by the correspondence of the intriguers themselves, still preserved in the archives of France.

Abbé Casgrain has been more than once reminded that he must meet these statements squarely or lose his case. He has not accepted the challenge. What he has done is to scour archives and libraries for everything that could tell against the hated "Anglais" and the yet more hated "Yankee," and to record the results with a passionate prolixity, matchless in its way. As for the ugly truths which he was invited to attack, he lets them severely alone, and follows, or tries to follow, the advice of *Dogberry* to the constables when they had fallen foul of a culprit too muscular to handle, "Let him go, and thank God you are rid of a knave." But the ugly truth will not go. Once or twice only he fancies that he sees an opportunity to make a fierce demonstration against some small point of no bearing on the main issue; as when, in the memorable row raised by Sam Weller upon Mr. Pickwick's being carried before the magistrate at Ipswich, his friend Mr. Winkle shunned all collision with the myrmidons of the law, and sparred valiantly against a little boy by the roadside.

Abbé Casgrain possesses in a supreme degree the comfortable gift of finding in his inquiries nothing but what he wants to find. On the other hand, the sense of historical proportion has been denied him. The removal of the Acadians, which few persons in Canada or the United States ever heard of before Longfellow made a poem out of it, looms on his sight like a hideous black cloud, darkening the whole field of American history. He has pursued his protracted labors with an amazing singleness of purpose, snatching with delighted avidity at anything that might serve as a stone to cast at the abominable Yankee. He calls it impartiality to see one side of the story, and obstinate prejudice, if not moral obliquity, to see both.

Yet he has not toiled four years for nothing. It is true that he has dodged the facts which have so exercised his soul, and tried to bury them under a foaming torrent of recrimination, seeking comfort in the prophecy that he who has dared to make them public will be punished with speedy and deserved oblivion. It is also true that, all ablaze as he is with zeal and passion, he is anything but a safe guide; that his wish is father to his thought; that when he is met by a dangerous truth he shuns it by shutting his eyes and hiding his head in a bush; and, moreover, that he is not only highly imaginative, but agile beyond belief in jumping at conclusions. Hence he must be followed with the most watchful caution.

So much labor, however, concentred on so narrow a space, must needs produce its effect. He has utterly failed to show that the Acadian story has not another side, fully as dark and repulsive as that which, till lately, has been the only known one. The following are the

chief points he makes: That the removal of the Acadians was not the work of the British Government, but of its servants in America—a fact, however, which everybody knew who had looked into the matter at all. Next, that the Englishman Lawrence, chief actor in the tragedy of removal, and already known as harsh and violent, was also a bad governor and a corrupt man. Next, that the New Englander Morris is chargeable with duplicity and cruelty. The most important documents which Abbé Casgrain has printed do not, however, relate to the removal of the Acadians, but to a period from thirty to forty years earlier—a period, by the way, with which Mr. Parkman has not yet had occasion to deal except in the way of brief reference. These papers show that when the country was passed over to the British crown, the English governors used inexcusable means to prevent the Acadians from emigrating, being apparently as anxious to keep them in the province as later governors were to get them out of it. Finally, Abbé Casgrain produces the first real evidence we have seen in support of the oft-repeated charge that New Englanders coveted Acadian lands. These points should be fully and fairly considered in recounting the miserable story; but, while they add to the burden of one party, they do not lighten that of the other.

If Abbé Casgrain means to confute Mr. Parkman and Sir Adams Archibald, he must fall to and write another book, for all his multifarious productions of the last four or five years have done nothing towards dislodging the adversary. Yet he has the claim to our gratitude of giving us all that can be said by the most eager and industrious of advocates on one side of a mooted question. That after all his labors he has not answered the allegations he so detests, is good proof that they are unanswerable. The truth is, that the treatment of the Acadians was a scandal on both sides.

The Story of Mexico. [Story of the Nations.] By Susan Hale. G. P. Putnam's Sons. 1889.

WHAT is written in the book of Fate and publishers' plans has to come to pass, and as this volume of the series was long ago announced and put on the stocks, we suppose it is useless to object to it as now unnecessary. Those who have access to Bancroft's volumes will have no use for this, while, if it is a question of a compend, Bancroft has furnished that, too, and of a sort that must be pronounced superior to this except in point of literary style. One thing alone can we think of that would have justified a new condensed work on Mexican history, and that is a summary presentation of the results of historical and archæological investigation as affecting Mexico's mythical and legendary periods. If one could tell the tales over again as they are gradually taking shape at the hands of Brinton and Bandelier, of Orozco y Berra and Bátres, not to mention German workers, that would be something to be truly thankful for. But, alas! Miss Hale's book is far from doing this. She is conscious that something of the kind needs to be done; that the old nursery-stories cannot be repeated without apologies, and profuse indeed are her apologies—she is "indulging her imagination," she tells her readers, "and playing with legend"; "it would be a pity wholly to set aside" fabulous accounts, she thinks, and concludes that we may as well a little longer "enjoy the tale of past magnificence." And through 123 mortal pages does that tale run, over one-quarter of the entire book. We are aware that this ought not to be laid exclusively at Miss Hale's door—the publisher's plans called for some account of "the myths with which the history of all lands begins"; but in this case at least the performance is dangerously like the desperate clinging to a creed that can no longer be believed.

This long preliminary loitering of the book between two worlds, one dead, the other powerless to be born, is the more to be regretted since it seems to have compelled the practical ignoring of the whole period from the Conquest to Independence. Scant twenty pages are devoted to 250 years. These years do not lend themselves to the telling of a "story," the author thinks. Nor do they, if one looks alone at the dismal succession of viceroys, lists of church dignitaries, and records of the Inquisition. But back of all these it is possible to go and get at bits of actual life in art, in monastic education, in the methods of extending the Church, in the system of government under which the Indians were brought; and it is a pity to sacrifice all these to Aztec gods and dynasties. Miss Hale more than once gives a suggestive glance at contemporary happenings in Spain, France, and England, helping thus to fix the era and enforce the contrast. But all her joggings of the memory of this sort are not worth one sentence in Sir Henry Maine's last book, where he remarks, wholly in passing, that the system of forced labor in Mexico was no improvisation of the conquerors, but only an institution of the Old World carried over to the New—the *corvée*. But Sir Henry Maines do not grow on every bush, and it would hardly be fair to condemn another for not giving off his flashes of historical insight.

For the history of this century Miss Hale has made a faithful study of the authorities, and has written a narrative which is both clear and, in the main, accurate. It is something of an omission that she makes no mention of Victoria among the guerilla champions of independence who kept up the fight from Hidalgo to Iturbide. Like many another writer, she is staggered at the chaotic state of Mexican politics between Iturbide and Juarez, but for her to take the life of Santa Anna as the thread upon which all the events can be intelligibly strung, is to give up the idea of a philosophical history of the period from the start, and it is inevitable that she should soon tacitly abandon, as she does, her chosen "guide through this puzzling labyrinth." The Intervention is not very strongly handled, some mistakes being discernible even when the older narratives are made the test; of the recent and important evidence bearing on Maximilian's conduct at the wind-up of his empire, we see no trace here. We have noticed several misprints, mostly in proper names, and some minor inaccuracies of statement, none of which does it seem worth while to point out. One mistake, however, ought to be corrected, if only because it is one frequently made. Mexico is not yet free, says Miss Hale, from the burden of debt entailed upon her by Maximilian's ruinous loans. The debts of the empire were all most justly repudiated. Not one cent on those bonds, was the word of Juarez, and has been the steady policy of Mexico since. A small part of Maximilian's immense borrowings might, indeed, seem to be a just debt of Mexico to day—the $4,500,000 which he paid as interest on the London debt. But even this Mexico has thus far refused to assume, and probably will never agree to pay.

Life of John Stuart Mill. [Great Writers.] By W. L. Courtney. London: Walter Scott; New York: T. Whittaker.

WHETHER disciples of Mill be numerous or not at Oxford, Mr. Courtney has taken good care that his readers shall not mistake him for one of them. In speaking of his monograph, it is perhaps easier to state what it should not have done than what it might have done; and, although the method be illogical, one can have no hesitation in saying that a critical biography of Mill's life and work should not be made the means of covertly conveying the opinions of an antagonistic school still in a minority in England. Mr. Courtney writes from the centre of the Oxford reaction against utilitarian theories in ethics and individualism in sociology; he has no sympathy with what he terms the "destructive, transitional" philosophy of Mill; consequently, he makes it his purpose to tell us, not so much how Mill stands with regard to the whole current of nineteenth-century thought, as how he is viewed by Mr. Courtney's circle in Oxford to-day. The "we," so often prefixed with an ominous "but," in order to show the differences of opinion between the Oxford Hegelians and Mill, means the reactionary clique lately headed by Thomas Hill Green—the idealist, Grey, of 'Robert Elsmere.'

It is hardly too much to say that dislike of Mill's views has given rise to one case of misrepresentation. In discussing Mill's theory of Causation it is said: "But Mill's 'experience' is not like Mr. Herbert Spencer's; it is not 'race experience,' but 'individual experience.' He is, therefore, always open to the charge of trying to get wide-reaching truths out of the changing and fragmentary experiences of our three-score years and ten." Now, a reference to the 'Logic' (Book III, chap. xxi) proves very definitely that Mill maintained no such position. His contention was that, instead of the à-priori view of causation as one of the "categories" according to the Kantian method, it was possible to establish the fact of, and hence the belief in, causation as the result of an experience without exception in the history not only of the individual but of the race. Causation is coextensive with *all* human experience; and this gives it a false appearance of necessity. You see that one event follows another invariably and *unconditionally;* so do I; so does everybody. The sum of individual experiences makes it an unbroken race experience; hence causation is established by the Baconian method *per enumerationem simplicem;* and since, from the beginning of all human time, no single flaw has occurred in this continuous experience, the law of causation establishes itself as the principle of uniformity in nature, and constitutes the implicit major premise of every sound induction.

Mr. Courtney's objections to the individualistic standard of the essay 'On Liberty' cannot look for much support in America. The Germanizing influence has of late years been so strong upon English philosophy that one is hardly surprised at finding an undercurrent of Bismarckism in Oxford utterances upon social themes. All we have to answer is, that to such commentary on his opinions Mill himself would probably have replied: "Place the state or society before the individual, and you have the Germany of Bismarck; give free play to individual effort, and you have the United States." Heaven forfend that America fall away from her gospel!

The treatment of much of Mill's private life also leaves something to be desired. His relations with Mrs. Taylor are, of course, the most delicate test of the biographer's attitude, and this, we regret to see, is not without a touch of disparagement. Instead of seeing what is really touching in this one passionate episode of Mill's career, Mr. Courtney narrates it with the analytical glance and careless shrug of one in whom it calls up no sympathetic response.

The simple introduction of a parenthetical word of affection and pity says a great deal on such occasions; and the critic's silence, or half-silence, tells seriously against him. Even the familiar event of the destruction of Carlyle's 'French Revolution' leaves the commentator cold: it is worth while comparing with his account that given with such warmth of sympathetic feeling in Dr. Garnett's 'Carlyle,' written for the same series.

Needless to add that the 'Political Economy' and the 'Subjection of Women' share the same pitiless fate; and therefore, although Mr. Courtney has written with accuracy and clearness, not altogether wanting in ease, and although he does full justice to the noble qualities of Mill's mind and character, he is not the one to undertake a task of this nature. On him, however, lies but a small share of the blame, for, after all, the temptation of being one writer in such a brilliant series, combined with the rare opportunity of writing down a philosophical opponent without appearing to "slog," is not to be resisted—even by an Oxford don. The fault lies mainly with Prof. Robertson, the editor of the series, who, in his selection of a biographer for Mill, has committed an almost unpardonable literary gaucherie.

Louisiana. By Maurice Thompson. [The Story of the States.] Boston: D. Lothrop Co.

THE author of this book complains in his preface that he has had to write in harness; that he has been required to keep to the strict truth of history, and yet make the story as interesting as a fiction. It is always hard to write to order; but there is no lack of fascinating and romantic material in the history of Louisiana without going beyond the barest facts, as indeed Mr. Thompson shows. Unfortunately Mr. Thompson, we are given to understand, has a high reputation as a "prose poet," whatever untamed monster that may be; and though he keeps his prose Pegasus tolerably well in hand, every now and then the nag goes off, and woe to any unhappy reader who happens to stand in the way. The opening passages on the early discoverers and buccaneers (he thinks the "Spanish Main" was an expanse of water), and the heartcurdling account of General Jackson's victory ("carry the news to New Orleans"), are instances of the prose poetry. It is a real pity; for, when Mr. Thompson is not writing fine, and is telling the story, he does it well. But the selections and omissions are made by no rule at all. The peaceful development of Louisiana is told without an allusion to Edward Livingston's work as a codifier; not a hint is given that General Taylor was a resident of the State at the time of his victories and his election. Purporting to give in the chronology a complete list of the United States Senators, he omits Josiah S. Johnston. As is often the case with his publishers' books, the showy printing is attended with wretched proof-reading; and Mr. Bridgeman's illustrations are feeblest where "strength" is claimed for them. Some of the landscapes, though not vigorous, are pretty, and a few of the fancy views of antiquity are the same; but the representation of the diplomatic sale of Louisiana, which Mr. Thompson calls the treaty of "Ildefonso," is sad indeed.

British Letters. Illustrative of Character and Social Life. 3 vols. Edited by Edward T. Mason. G. P. Putnam's Sons. 1888.

MR. MASON has collected in his three volumes a great number of letters, some more and some less well known, which cannot be read or skimmed through without a great deal of pleasure. Lamb, Thackeray, Horace Walpole, and innumerable other well-known letter-writers have been made contributors—and it is hardly necessary to say that the wealth of English literature in correspondence is very great. Mr. Mason has endeavored to classify his letters under various heads, so as to make those which are placed together deal with one subject; but in doing so has been forced to pay comparatively little regard to dates, and still less to authorship. The reader is helped out by an index, and he may pick and choose in almost any way that he likes. On the other hand, the chief charm of correspondence is so connected with its continuity that it is diminished the moment the continuity is broken, and here the continuity is broken with every letter. We no sooner catch a glimpse of a familiar face or character than it is replaced by another. We have no time to get a distinct impression, and the rapid changes of authorship produce a sort of confusion that is disagreeable. But, as we have said, the letters selected are almost all worth selection, and any one who takes up the book is sure to find entertainment in it.

How to Write the History of a Family: A Guide for the Genealogist. By W. P. W. Phillimore, M.A., B.C.L. Boston: Cupples & Hurd. Pp. 206.

THE title of this book, which is printed in London by Elliot Stock, is slightly misleading to American readers. It is in reality a very useful manual for any English genealogist, and of service to cis-Atlantic students who wish to trace a family in England. The instructions given presuppose an ignorance of such matters on the part of educated Englishmen which is less frequent in this country, where so many town histories and genealogies have been printed. The author mentions with approval some American ideas and plans, and seems to be thoroughly informed as to his subject. More than half of the book is devoted to a statement of the present localities in which public records are stored. It is impossible in our space to give even a synopsis of this, but the value of such a list is very great, and we can sincerely recommend the volume to all genealogists as a most desirable addition to their libraries.

BOOKS OF THE WEEK.

Aldrich. Anne R. The Rose of Flame, and Other Poems of Love. G. P. Putnam's Sons. 75 cents.
Austin, A. Love's Widowhood, and Other Poems. Macmillan & Co. $2.
Blackwell, R. S. Treatise on the Power to Sell Land for the Non-Payment of Taxes. 5th ed. 2 vols. Boston: Little, Brown & Co.
Cawein, M. J. Accolon of Gaul, with Other Poems. Louisville: John P. Morton & Co. $1.
Crump, A. Investigation into the Causes of the Great Fall in Prices coincidently with the Demonetization of Silver by Germany. Longmans, Green & Co.
Die Edda. Deutsch von Wilhelm Jordan. New York: B. Westermann & Co.
Dyer, T. F. T. The Folk-Lore of Plants. D. Appleton & Co. $1.50.
Galton, G. Natural Inheritance. Macmillan & Co. $2.50.
Gerard, J. W. Titles to Real Estate in the State of New York. 3d ed. Baker, Voorhis & Co. $7.
Hartmann, E. von. Zwei Jahrzehnte Deutscher Politik und die Gegenwartige Weltlage. Leipzig: W. Friedrich.
Hatch, Rev. E. Essays in Biblical Greek. Oxford: Clarendon Press; New York: Macmillan.
Klein, H. J. Star Atlas. E. & J. B. Young & Co. $2.25.
Knight, W. Wordsworthiana: a Selection from Papers read to the Wordsworth Society. Macmillan & Co. $2.25.
Lang, A., and Sylvester, P. The Dead Leman, and Other Tales from the French. Scribner & Welford. $2.00.
Laurie, Prof. S. S. Occasional Addresses on Educational Subjects. Cambridge, Eng.: The University Press; New York: Macmillan. $1.25.
Lee, W. John Leigh of Agawam (Ipswich), Mass., 1634–1671, and his Descendants of the Name of Lee. Albany: Joel Munsell's Sons. $5.
Levy, Amy. Reuben Sachs: A Sketch. Macmillan & Co. $1.
Molière, J. B. P. de. L'Avare. W. R. Jenkins. 20 cents.
Moore, Rev. E. Contributions to the Textual Criticism of the Divina Commedia: including the complete Collation throughout the Inferno of all the MSS. at Oxford and Cambridge. Cambridge, Eng.: The University Press: New York: Macmillan.
Romanes, G. J. Mental Evolution in Man: Origin of Human Faculty. D. Appleton & Co. $3.

Thomas, E. C. The Philobiblon of Richard de Bury. Lockwood & Coombes. $3.75.
Thompson, D. G. Social Progress. Longmans, Green & Co. $2.
Thompson, Helen H. Strong. Songs in the Night-Watches. From Voices Old and New. The Baker and Taylor Co. $1.25.
Thompson, M. The Story of Louisiana. Boston: D. Lothrop Co.
Thomson, Sir W. Popular Lectures and Addresses. I. Constitution of Matter. Macmillan & Co. $2.
Thou Shalt Not: A Novel. G. W. Dillingham. 50 cents.
Tolstoi, L. N. Anna Karénina. T. Y. Crowell & Co. 50 cents.
Transactions of the American Institute of Electrical Engineers. Vol. V. New York.
Tytler, Sarah. French Janet. Harper & Bros. 30 cents.
Vallings, J. F. Jesus Christ, the Divine Man: His Life and Times. A. D. F. Randolph & Co. $1.00.
Vickers, R. H. The Powers and Duties of Police Officers and Coroners. Chicago: T. H. Flood & Co.
Vitzthum von Eckstädt, Graf. Shakespeare und Shakspere: Zur Genesis der Shakespeare-Dramen. Stuttgart: J. G. Cotta.
Walford, L. B. A Stiff-Necked Generation. Henry Holt & Co. $1.
Wasson, Rev. D. A. Essays, Religious, Social, Political. With a biographical sketch by O. B. Frothingham. Boston: Lee & Shepard.
Whittier, J. G. Prose Works. 3 vols. Boston: Houghton, Mifflin & Co. $4.50.
Wicksteed, P. H. The Alphabet of Economic Science. Part I. Elements of the Theory of Value or Worth. Macmillan & Co. 60 cents.
Wigmore, J. H. The Australian Ballot System as Embodied in the Legislation of Various Countries. Boston: Charles C. Soule. 75 cents.
Wilson—Fiske. Appletons' Cyclopædia of American Biography. Vol. VI. Sunderland—Zurita. With Supplement and Analytical Index. D. Appleton & Co.
Winchell, Prof. A. Shall We Teach Geology? Chicago: S. C. Griggs & Co. $1.
Wingate, C. E. L. An Impossible Possibility. Belford, Clarke & Co.
Woodbridge, W. S. Christ in the Life. Boston: Universalist Publishing House.

YOUNG FOLKS' HISTORY OF
The War for the Union.
By JOHN D. CHAMPLIN, JR.,
Editor of the 'Young Folks' Cyclopædias.' 8vo, illustrated, $2.50.

"It is a book that can be heartily recommended, as designed to meet a real want, and meeting it well. Indeed, the book gives a good deal more than it promises, for it is equally well adapted to general readers who are not young folks. It is, in short, a well-written and entertaining history of the war of the rebellion, very fair and impartial in tone."—*The Nation.*

"Mr. Champlin has made an attractive volume, and has put in the form of a well-told, connected, compact narrative the story of the great civil war. . . . It is written in an entertaining style, calculated to hold the attention of young readers."—*N. Y. Tribune.*

HENRY HOLT & CO., N. Y.

FLORIDA LANDS.
L. WINDSOR SMITH,
Civil Engineer, Surveyor, and Draughtsman, Palm Springs, Orange Co., Fla.
Will undertake to examine any piece of land in the State and report as to quality, locality, value, etc.
Lands accurately surveyed and maps furnished on short notice.

F. W. CHRISTERN,
254 Fifth Avenue, between 28th and 29th Sts., New York.
Importer of Foreign Books, Agent for the leading Paris Publishers, Tauchnitz's British Authors, Teubner's Greek and Latin Classics. Catalogues of stock mailed on demand. A large assortment always on hand, and new books received from Paris and Leipzig as soon as issued.

FOREIGN BOOKS. — *Russian, Polish,* Hungarian, Swedish, Danish, Hebrew, French, German, etc. H. ROSENTHAL & CO., 14 Cooper Union, N.Y.

THE AUSTRALIAN BALLOT SYSTEM.
By J. H. WIGMORE.
Cloth, $1.00, net; paper, 75 cents, net.

A compilation of the Ballot Acts of various Countries and States—under the system of secret balloting known as the Australian. With an Historical Introduction and Notes.

Published by CHARLES C. SOULE,
15½ Beacon St., BOSTON.

MISS A. C. MORGAN, PRINCIPAL of Young Ladies' School, Portsmouth, N. H., announces her annual vacation trip to Europe, including Norway, Sweden, and Denmark.

The Nation.

NEW YORK, THURSDAY, MARCH 21, 1889.

The Week.

THE appointments to the minor foreign missions thus far represent an unusually high level. Ex-Senator Palmer of Michigan is one of the few representatives sent to Spain by the United States with ability to speak the language of the Madrid court. In like manner, Mr. Thomas of Maine, who returns to the post which he held at Stockholm under a previous Republican Administration, speaks the Swedish language. Mr. Enander, who goes to Denmark, is a Scandinavian by birth, and the only cause for regret about his appointment is the fact that he displaces that accomplished Scandinavian scholar, Mr. Rasmus B. Anderson, who now represents this country at Copenhagen. Ex-Gov. Porter of Indiana, the new Minister to Italy; Mr. Thayer of Minnesota, who goes to the Netherlands; and Mr. Washburn of Massachusetts, who is appointed as Minister to Switzerland, are all men of education and character, who will never cause their countrymen to blush. If the standard thus set for the smaller missions is maintained for the chief places, the diplomatic service will do the nation credit. We have learned that Mr. Perry Belmont resigned his position as Minister to Spain by telegraph on the first day of March. Our comment, therefore, on his supposed removal by Mr. Blaine was unwarranted, and we tender to Mr. Blaine our apologies for the same.

Mr. J. S. Clarkson of Iowa was Vice-Chairman of the Republican National Committee. It has been shown by undisputed evidence that, while in this position, in combination with Mr. Quay, he bribed two clerks in the employ of the Prohibitionist journal, the *Voice*, for the sum of $250, to steal their employers' mail-lists and hand them over to the Republican Committee, to be used in sending Republican documents. We believe there is a doubt among the lawyers whom the *Voice* has consulted whether this is an indictable offence under the laws of this State; we do not believe, however, that there is any doubt among either religious men or men of honor generally that it was a disgraceful and immoral act. Nevertheless, when Mr. Quay's and Mr. Clarkson's attention was called to it, they made merry over it, and when the story got out, they received showers of congratulatory telegrams from their political associates in various parts of the country. The *Press* of this city rejoiced over the theft, as it "enabled Col. Quay to circulate the American idea thoroughly during the campaign just closed." Now, we know very well what professional politicians think of such tricks, but what the public would like to know is what President Harrison thinks. He is not a professional politician. He is a lawyer of high standing in his church, and a moralist of considerable austerity. And yet he has just nominated Clarkson for the place of First Assistant Postmaster-General, one of the most important in his gift. The theft of the *Voice's* mail-list is, we may be sure, not the first bit of sharp practice in which this gentleman has been engaged. What, then, is the exact relation of the Republican party to the religion and morality of the country?

The nomination of Mr. Hazen for the important position of Third Assistant Postmaster-General is a most excellent one. Mr. Hazen worked his way up to this place from a clerkship, and was retained for two years by the Cleveland Administration on account of his almost invaluable qualities. He ought to have been retained the other two years, and is very properly restored to his office. The important place of Superintendent of the Railway Mail Service goes to a Philadelphian who has the excellent recommendation of having been traffic manager of the Philadelphia and Reading Railroad, and, if he will only apply the business rules of his old position to his new one, nothing more can be asked.

The action of President Harrison with regard to the New York Post-office will be a crucial test of the value of his professions of devotion to the principles of civil-service reform. The office is one of the greatest Government offices in the country or in the world. It is in perfect order, and a model to all similar offices everywhere. It has been conducted on business principles for four years, to the great satisfaction of the people of this city, by a Postmaster who was retained in office by his political opponents solely because of his eminent fitness for his place. He has proved to demonstration during these four years the humbug and falsehood of the spoils theory, that a postmaster or collector of customs must needs belong to the same party as the President, and hold the same political views. In fact, if the civil-service reformers had been allowed to make up or construct a test of Republican sincerity, they could not have constructed a better one than Mr. Pearson's place offers. He is a Republican whose party has come back to power, and finds him reflecting honor on it by his faithful performance of his duty under a Democratic President. We hear that there is "not a chance of his being retained," but we do not believe it. How can we, after what we have heard of President Harrison's integrity, both political and personal, and of Mr. Wanamaker's zeal for the efficiency of the service? The latter does not depose the head of his undergarment or shoe department because some other Republican wants the place.

The selection by Mr. Blaine of his son, Mr. Walker Blaine, as Examiner of Claims in the State Department is a very unfortunate one, which a sensitive or scrupulous man would not have made. Claims are a subject on which Mr. Blaine himself is peculiarly exposed to criticism. They brought him, and the whole country through him, into very hot water when he was last in the State Department. It was in pushing an old claim against the Peruvian Government on behalf of one Landreau, a Frenchman whose American citizenship was very doubtful, that he came near involving us in a war with Chili in 1881. In pushing it, too, he produced doctrines of international law, of his own invention, which led the Chilians to treat him with silent contempt. Of this we said in 1884, when he was running for the Presidency: "That Mr. Blaine had a personal interest in the claim there is no proof; but the extraordinary amount of official interest he showed in it, the extraordinary means to which he resorted, and the extraordinary risks which he ran in order to save and support it, naturally excited the curiosity of all and the suspicions of a great many." When we add to this the odium which he brought on himself by his Little Rock Railroad transactions, one would say that he had had enough experience of a certain kind to make him cautious for the rest of his days. The examination of private claims against foreign governments, and especially against weak South American governments, is work which, if only for appearance sake, he ought not to commit to his son. This would be true even if his son were, like his predecessor in the same office, the late Dr. Wharton, a man of mature age and an acknowledged master of international law. We would now ask what the Republican organs would have said had Mr. Bayard, with his stainless reputation, put his own son or nephew in this place, as a successor to one of the leading jurists of the country? We shall keep asking this sort of question occasionally. We must only hope the contrast between the two men is not a measure of the difference on the ethical side which we are to see between Mr. Blaine's management of our foreign affairs and Mr. Bayard's.

The recent summary of the changes in the various divisions of the Treasury Department during the Cleveland Administration took into account only the "chiefs," as they are called. But it must be remembered that these are not the only officers appointed by the Secretary without consultation with the Civil-Service Commission. Leaving out of consideration those of inferior grade, such as messengers and laborers, there are in the higher circles not only chiefs, but assistant chiefs, superintendents, and others of like character, constituting, according to the old standard, proper prey for a spoilsman Secretary. These places Mr. Cleveland's Secretaries could have filled with their own friends. Yet at the close of the Democratic Administration the number of those occupying such places appointed from without the Department, and consisting, presumably, of "workers," is only one-half the entire number. If we class as Republicans all those holding such places at the advent

of the Cleveland Administration who have been retained to the end, and all those promoted to such places from inferior posts obtained during the previous administrations (which is not a strictly accurate classification, though lacking little of being so), we have sixty-five Republican officers drawing $148,000 a year in salaries, and sixty-four Democratic officers getting only $140,000. This, it must be admitted, is a creditable showing. Going into details, we discover in the office of the Treasurer twenty places of this kind, nineteen of which are filled by old incumbents, while the one new man was appointed to fill a vacancy caused by death. In the various bureaus classed as part of the Secretary's office are twenty-two such posts, sixteen of which were found by Mr. Windom occupied by old employees. In the office of Commissioner of Internal Revenue, out of ten positions of this sort only three were filled with new appointees, and no changes whatsoever were made among this class in the Bureau of the Mint. In the six auditing offices considerable havoc was done, but even there, out of thirty-seven officials of this class, nine were spared. It must be added that several of these places have been created during the last four years, and these were naturally given to "outsiders."

The "evidence" collected by Byrne, the special officer of the Treasury, in his late Custom-house investigation, has at last been printed and presented to the Senate. It is known as Executive Document 123. It contains ninety-six pages. We have read it as far as p. 50, which includes the testimony of the well-known Examiner McElwee. We do not think the sternest moralist could ask us to do more. We desire to speak with the utmost moderation and restraint when we say we think it one of the most discreditable official documents which have ever appeared in this or any other highly civilized country. It much surpasses Byrne's report in silliness and absurdity. We have not come across a single statement going to show the existence of "sugar frauds," or any frauds, in the Custom-house which would be accepted as evidence against any man's character in a court of law, or before any respectable tribunal. What the affidavits contain is simply the gossip which may be collected in any large collection of men, or even in a large boarding-house or factory, about people whom somebody else does not like or feels jealous of. There are surmises and suspicions, and suspicious circumstances, and doubts, and suppositions, some of them worthy of a girl's school, or of the women in a quarrelsome tenement-house, but no facts. Here is a specimen of the kind of affidavit that Byrne collected, and upon which the late Secretary of the Treasury thought fit to base attacks of the grossest kind on the personal character of his subordinates, and which is now printed at the public expense:

N. Y., July 12, 1887.

I have heard Examiner Bowne and Sugar Broker Burt in loud controversy occasionally in regard to disagreements of tests, and have seen them almost directly afterwards in apparently close conversation together in the hallway. The impression might naturally be left on the occupants of the ass't appraiser's office that the loud tone used by them was for effect and unnecessary.

ALARIC CECIL MORGAN.

Sworn and subscribed to before me this 12 day of July, A. D. 1887.

T. AUBREY BYRNE,
Special Treasury Officer.

We are very sorry that somebody cannot be punished for this affair. No honorable or intelligent man can rise from the perusal of this document without a strong feeling of indignation.

The first election which Montana will hold as a State, in October next, will be conducted on the Australian system of voting. A ballot law based upon that system was passed by the Territorial Legislature at its present session, and was signed a few days ago by the Governor. Both houses of the Rhode Island Legislature, too, have passed a ballot-reform bill, but the Senate made the date for its going into operation April, 1890, and the House changed this to June, 1889. There is no doubt that the Senate will accept this amendment, and that the bill will become a law. It is in all important respects a close model of the Massachusetts law, and is an excellent measure. It has had the support of both parties, and has been enacted in response to a very strong public demand. The leading advocates of it could have had it put in operation at the approaching election in April, but they deemed it wiser to wait, as the time for preparation was so short. There are, therefore, at present, four States having excellent ballot-reform laws. This is likely to be the total result of the movement during the present year, and it is on the whole an encouraging one. It should be remembered that the agitation of the question has been going on only about two years. The immediate results have been much greater than those of the civil-service-reform agitation; for, though that has been in progress now for many years, only two States, Massachusetts and New York, have yet enacted laws embodying its principles.

It appears that there is a majority of several thousand votes against the prohibitory amendment in New Hampshire—a result never for a moment anticipated by either side to the controversy. The opponents of the proposed change relied upon the requirement of a two-thirds vote as their real safeguard, expecting that the friends of prohibition would have a majority. Now that it turns out that a majority voted against prohibition, the prohibitory law, which would have been in no danger if the amendment project had not been agitated, is threatened, and it is predicted that the Legislature will pass a high-license law, although the Governor is counted upon to veto it. The next Legislature, by the way, will be the last to meet in June, as the amendment changing the time for the opening of the session to January was adopted on Tuesday week by an overwhelming majority.

There was a discussion in the Senate last week which incidentally raised the question of the inadequacy of the pay of the Senators themselves, and this led to some feeling remarks on the part of several members of that body, with which it is impossible not to sympathize. The compensation of a Senator of the United States is $5,000 per annum. This sum does not enable him to live in a befitting manner. It is not more than one-half the sum that is required to keep house in Washington even in a modest way. Consequently, Senators who have no private fortunes to draw upon must take lodgings, and forego the social amenities which custom has established as appertaining to their station. Such a position is humiliating to a sensitive man. Moreover, the Senator, and the Representative as well, is put to a great deal of expense, really unavoidable, by his constituents, in running around among the departments. This calls for carriage hire, for if he performs this work on foot, he loses time which belongs to the public. Then he has a large daily correspondence, and needs a clerk to help him out with it. If he does not happen to be chairman of a committee, he must pay his own clerk hire. He must also pay his postage. He must offer some civilities which cost money to distinguished visitors from his State when they come to Washington. In point of fact, the $5,000 which he receives as annual compensation is pretty far eaten up before he gets to his own living expenses. Senator Platt of Connecticut thought, as we think, it was time for somebody to speak out.

There is only one remedy for this state of things, and that is to increase the pay of members of both houses. It ought to be twice what it is now, or $10,000 a year. Even then no one would lay up anything against a rainy day unless he voluntarily chose to live in a niggardly manner. The pay of the members of Senators and Representatives together, 401 in number, is now about two million dollars. It would then be four millions—a beggarly sum in comparison with what is voted into the pockets of river-and-harbor and public-building contractors every year, and quite insignificant as compared with the largesses voted by means of the tariff into the treasuries of protected interests, Trusts, and "combines." The reason why Congress has not voted an increase is probably that the recollection of the "back-pay grab" of 1873, and the tremendous popular revolt against it, has intimidated everybody. But it should be borne in mind that it was the *back* pay rather than the increase of pay that caused that uprising. Congress voted at the expiration of its own term that the increase of pay (to $7,500 per year) should date from the beginning of the same term; that is, that it should date back two years. It was the voting of $5,000 out of the Treasury to each Senator and Representative on the last day of the Forty-second Congress. If the bill had not been retroactive, it would not have caused much disturbance, although it came at an unlucky period, the financial crisis of 1873 setting in shortly after the measure passed. The public indignation over the back-pay grab was so great that the

next Congress repealed the bill so far as it was still repealable, and accordingly the pay of members remains to this day at the parsimonious figure at which it stood before. There is no reason to suppose that any similar reaction would take place now if the pay were increased, provided it were made prospective merely.

About a year ago Judge Pieden of St. Clair County, Mo., was ordered by the United States District Court to levy, as County Judge, a special tax to pay the interest on certain railroad bonds guaranteed by the county. This the Judge firmly refused or utterly failed to do, and, having judicial knowledge of the consequences of his refusal, kept out of the way, so that when the marshal came after him with a warrant of arrest for contempt, he was nowhere to be found. For a whole year the search for him was kept up, but in vain. He was always warned by friends of the approach of the officers of the law. The device by which he was finally captured was probably one of the most ingenious in the history of political science. The officers knew him to be passionately fond of the chase, and especially of the fox chase; so they organized in an adjoining county, not in the Judge's own, "a fox drive" on a great scale, and advertised it far and near. They were early on the ground themselves, well mounted, and anxiously waited for the effect of their scheme on the Judge's imagination. Sure enough, he soon appeared, mounted on a white mule, and full of ardor for his favorite sport. As soon as the fox had been found, and the hounds were in full cry, and the Judge's mule was pressing close behind them, the marshals rode up, having swifter steeds than the mule, and proposed to arrest him. He promptly slipped down off his mount and took to the woods on foot, under a smart pistol fire from his pursuers, but of course was soon compelled to surrender, and is now in jail, where, according to the reporter, he expresses "a very poor opinion of the United States Government," which is not surprising, considering the way in which he was caught.

The murder of Capt. F. S. Dawson, editor of the Charleston (S. C.) *News and Courier*, is a most melancholy close to a career which had already been fruitful of much good, and was full of promise for the future. For twenty years Captain Dawson was one of the most prominent editors in the South, and he made his journal one of the chief influences in all that part of the country. He used his great power for the promotion of all good causes, and did more than any other man—one might almost say more than all other men—to overthrow the sway of "the code"; duelling being now under the ban, instead of the recognized resort among gentlemen, as when the *News and Courier* began to expose its essential brutality. In politics Captain Dawson stood for all progressive impulses, and his paper never hesitated to defy prevailing sentiment when the editor thought that the populace were wrong. The removal of such a man is a loss not merely to his State or to the South, but to the whole country.

The only thing quite clear in the great copper crisis is that certain speculators in Paris, after trying to hold more than 100,000 tons of copper suspended between heaven and earth, found that their muscles were giving way, and managed to transfer their load to the second largest bank in France; that this bank tried to hold the weight, and might have done so for a long time, perhaps for ever, if it had grown no heavier; that the pile of copper grew on its counter until it became a crushing weight, when the Bank of France, at the instance of the Government, took as much of the load as it could carry, but that the pile on the counter of the first-mentioned bank began to grow afresh, and finally carried it down to the earth. The Société des Métaux is smashed, the Comptoir d'Escompte is smashed, the Bank of France is disabled from helping private borrowers to the usual extent, and in fact the situation is considerably worse than it would have been if the Government had minded its own business and allowed the Société des Métaux and the Comptoir d'Escompte to reap the consequences of their own folly and go to smash their own way. But that is not the French way. The glory of the nation has to be considered in such cases. If a speculation acquires such magnitude as to attract the eyes of foreigners, it must not be allowed to fail. Accordingly, when the copper crowd were on the eve of bankruptcy, some two weeks ago, M. Rouvier, the Minister of Finance, summoned all the great men in the banking world to meet him and take steps to save the national honor and prestige. Fancy the Secretary of the Treasury calling a meeting to save the Fidelity Bank after it had lent all its capital and deposits to the wheat speculators in Chicago, or to help the Marine Bank in New York after it had been "gutted" by Fish & Ward. This is substantially what M. Rouvier did.

Gen. Boulanger's speech at Bordeaux announced that "the goal towards which they were marching was a non-parliamentary republic, which would be the protectress of the weak and lowly, and be passionately preoccupied with the interests of the people, respecting the liberty of the individual, and above all liberty of conscience." This is rather melancholy news for the Boulangists. Although this sort of government is frequently promised by public men, its establishment is hardly possible without a considerable change in human nature. If the kind of men who set up republics like this were at all plentiful, of course the world would have no need of Boulangers or Powderlys, and the work of government would be as easy as shoemaking or tailoring. Of course, Boulanger's republic would contain just the same number of rascals and honest men as the present one, and Wisdom would have just the same difficulty in getting control of affairs in that one as in this.

The Liberal victory in Kennington is the most serious reverse the present English Ministry has sustained. London is now divided into thirty boroughs, returning two members each, including the University, of which thirteen were won by the Liberals at the last general election and seventeen by the Tories. On the Tory strongholds no impression has since been made, and the opposition of the metropolis to Home Rule has been a tower of strength to the Liberal Unionists. It now appears, however, as if the tide had turned, and the Government was in danger of losing the whole thirty-four seats which the capital gives them. What effect this will have on the ministerial imagination remains to be seen, but it would not be at all surprising if it precipitated a dissolution of the present Parliament. Socialistic questions are said to have largely influenced the result in Kennington, so that the Home-Rule cause could hardly have won without their help. That this would be a result of the ministerial policy in Ireland good observers have long foreseen, and herein has lain a large part of its folly. When social questions are in the air, a government which is not only ostentatious, but vindictive, in asserting the rights of property against the poor, as in Ireland, and heaps insult on their champions, and tries to silence protests, not only by jeers but by plank beds and striped jackets, simply stimulates the spread of extreme radical views on every subject. Greater political madness than the notion which has taken possession of most Englishmen of the middle and upper class, that they were strengthening the foundations of social morality by locking up Irish members and sending troops to carry out evictions, has not been seen in our time. On the contrary, they have been greasing the wheels of the Radical car.

The only newspaper in the world, as far as we know, which has come to the defence of the London *Times* since the Pigott incident is the London edition of the New York *Herald*, which declares in "frankness and justice" that

"the *Times* made a stern, lavish, honorable, heroic contest, to be remembered, as it will surely be, to the honor of that journalism which, in a sense of duty to the people, finds no labor a sacrifice."

This increases the mystery of "journalism." In what other department of human activity could it be "honorable or heroic" to purchase from a scoundrel and publish a forged letter imputing to an opponent complicity in assassination, refuse to give him any reason for considering it genuine except the resemblance of the signature to his own, and the probability that so bad a man as he was would write just such a letter, and then load him with insult based on the letter for a whole year, and finally put him to an outlay of $150,000 in finding out whence the letter came? Why should this be honorable in "journalism," any more than in medicine, law, or theology, groceries, dry-goods, or Yankee notions? This is all the droller because the New York edition of the *Herald* says that

"as for the *Times*, its audacity of three months since is only equalled by its present humiliation. It has published an apology for the crass stupidity with which it became the willing dupe of a spy and an informer."

INDIANA'S NEW BALLOT LAW.

THE enactment of a comprehensive and stringent secret-ballot law for the State of Indiana is an achievement of national importance. If a vote of the country had been taken a month or so after the last Presidential election on the question of which State in the Union was most in need of such a law, the verdict would have been practically unanimous in favor of Indiana. In no other State has there been such general debauchery of the suffrage by both parties during the past twenty or twenty-five years. The evil began when Indiana was an October State and it was necessary to carry it for the "moral effect" upon the election in November. It is notorious that it was bought outright for this purpose in more than one national campaign. That Dorsey carried it with "soap" for Garfield in 1880, was confessed by no less a person than Garfield's asso ciate on the ticket. That Dudley's "floaters in blocks of five" had a great deal to do with the Republican success there last November, is more than suspected; indeed, it was the open use of money in that election which so aroused public sentiment in the State that the Legislature felt compelled to heed it and pass the new law.

We are indebted to Senator Andrews, its author, for an official copy of the law, and find it in many ways the most complete system of election and ballot reform which has yet been adopted in this country. While very similar to the Massachusetts law, it is superior in the thoroughness with which it is made applicable to the entire State. It provides for dividing the State into election precincts of 200 voters each, the number in no case to exceed 250. This avoids all danger of such delay as would deprive electors of their votes in towns of from 400 to 1,500 voters, where precinct divisions have not heretofore been made. There has been some fear of such delay in Massachusetts, when the law shall go into effect there. The Indiana law makes explicit provisions also for the creation of a complete corps of election officials for each county and precinct, every member of which is bound by oath to do his duty under severe penalties for all violations.

In regard to nominations for office, the Indiana provisions are similar to all other adaptations which have been made of the principles of the Australian system. The regular parties certify their nominations through the officers of their nominating conventions or committees. Independent nominations can be made by means of petitions or nomination papers, the signatures of 500 qualified electors being necessary for the nomination to a State office, 200 for member of Congress, 25 for member of the Legislature or officer of a county, and 20 for officer of a township, ward, or other division less than a county. This is a most valuable concession to the rights of independent voters, since it gives them at all times ample power to nominate their own candidates, to have their names printed on the official ballots, and distributed on equal terms with those of the regular parties.

The ballots, which are to be printed and distributed at the public expense, are to be "of uniform size and of the same quality and color of paper, and sufficiently thick that the printing cannot be distinguished from the back." All ballots for State officers, or for candidates for whom all the electors of the State can vote, are to be printed on red-tinted paper; all others on white paper. The candidates of each party are to be grouped under such name, title, or device as its managers may direct, and are to be arranged in columns, each party having a column to itself. In case of the "death, removal, or resignation of any candidate" after the printing of the tickets and before the election, it shall be lawful for the party organization whose candidate he was, to "provide the election board of each precinct with a number of pasters, containing only the name of such candidate, equal to the number of ballots provided; but no pasters shall be given to or received by any one except such election board and such chairman, and it shall be the duty of the polling-clerks to put one of such pasters, in a careful and proper manner, and in the proper place on each ticket before they shall sign their initials thereon."

The provisions relating to the use of exclusively official ballots are very stringent. It is evident that Gov. Hill's fear of abuse in case election officers are required to put their initials upon the ballots, has made no impression upon the Indiana law-makers, for the law requires the poll-clerks to "write their initials, in ink, on the lower left-hand corner of the back of each of said ballots, in their ordinary handwriting, and without any distinguishing mark of any kind"; and no "inspector of election, or judge acting for an inspector, shall deposit any ballot upon which the initials of the poll-clerks do not appear." In preparing his ballot the voter is required to use a stamp which is handed him by the poll-clerk. He can indicate his choice by stamping opposite each name for which he wishes to vote, or by placing a single stamp opposite the title or device of a party, thus signifying that he votes for the whole group. He must prepare his ballot alone in a compartment, must fold it upon leaving the compartment, so as to expose the clerk's initials on the back, and must deposit it so folded. "If any elector shall show his ballot, or any part thereof, to any other person, after the same shall have been marked, so as to disclose any of the candidates voted for, such ballot shall not be deposited in the ballot-box." Only one person shall be permitted in a compartment at one time. Not more than three persons other than the election officers shall be permitted to enter or be in the election-room at one time, and no voter shall hold any conversation or communication with any other person than a member of the Election Board while in the election-room. Any elector who declares that, by reason of physical disability or inability to read the English language, he is unable to mark his ballot, "may declare his choice of candidates to the poll-clerks, who, in the presence of the elector and in the presence of each other, shall prepare the ballots for voting, and, on request, shall read out to such elector the names of the candidates as marked,"

The penalties for violations of the law are all heavy. Any voter who makes a false declaration of inability to mark his ballots can be fined not more than five dollars, and be disfranchised for five years. Any clerk deceiving an elector in marking his ballot can be imprisoned for from two to five years, and disfranchised for any determinate period not less than five years. Wilful neglect or deceit on the part of the official in charge of the printing of the tickets is made a felony, punishable with imprisonment from three to ten years, and disfranchisement for not less than ten years. No electioneering is allowed within fifty feet of a polling-place; no elector shall be allowed to put any mark upon his ballot by which it can be identified as his after being cast; no elector shall show his ballot, after it is marked, in such a way as to reveal its contents or the name of any candidate on it, or shall name any candidate or candidates for whom he has marked his vote. In all these cases the penalty of violation is imprisonment for from six months to a year, and a fine of from $100 to $500, and disfranchisement for not less than ten years.

An excellent provision for the destruction of the ballots after counting has been borrowed from our New York election laws. They are to be "totally consumed by fire" immediately after the counting is completed, with the exception of one, which shall be preserved for record. This requirement has been found of the greatest value in this State in preventing all efforts to go behind the returns and bring on a disputed-election contest.

The new law is to go into effect in June, 1890; that is, the next biennial election in Indiana will be held under it. It will be in force at the next Presidential election, and with its absolute secrecy in the act of voting must inevitably put a check upon the use of "soap" and of "floaters in blocks of five." It will be impossible to follow a bribed voter to the polls to see if he keeps his agreement, and that fact alone will be sufficient to put an end to the greater part of the bribery.

SOOTHING SYRUP FOR CANADA.

A LIBERAL allowance of soothing syrup was poured out to Canada by honorable Senators on the Republican side of the Chamber on Tuesday week. The occasion was a motion made by Senator Payne of Ohio to strike from the list of select committees the one "on Relations with Canada," of which Senator Hoar is Chairman. Mr. Payne argued that since we have a Committee on Foreign Relations, and a Committee on Commerce, and a Committee on Inter-State Commerce, a Committee on Relations with Canada was a superfluity. Nobody really answered Mr. Payne's argument, but the Committee was continued, nevertheless. Mr. Morrill of Vermont, while voting to continue the Committee, hoped "that they would do as little in relation to their supposed duties as possible." The supposed duties were the nursing

of a sentiment favorable to the political union of Canada and the United States. It was Mr. Morrill's opinion that the more you nurse this sentiment the smaller it will grow in Canada, and that if you really want it to increase, you must just leave it alone and let it find its own nursing where it can. His colleague, Senator Edmunds, did not want it to grow anyhow. He did not want to see six new States coming into the Union with "unassimilated elements," even with the assent of the British Parliament and the people of Canada.

Senator Hoar essayed to give the *raison d'être* of this select committee, differentiating its functions from those of the standing committees of the Senate, but without any great logical success. His idea was that this Committee should accumulate a vast deal of information on the subjects of the trade between the two countries, and the political and judicial constitutions of Canada, and the different races and religious denominations of that country. He thought that the interests of his constituency almost required him to give two or three years' study to that one subject, and he would be glad to do so. On the political side of the question under debate Mr. Hoar said:

"It is useless for us to be blind to the fact, and no discretion requires us to be silent in regard to the fact, that there is a large and growing body of men in Canada who desire annexation to this country. Political power is likely to turn and hinge upon that question in the near future in the Dominion of Canada, and upon the question whether the American people desire such an annexation or not. Nobody, of course, proposes to accomplish it without the free and intelligent and instructed will of both countries. It was impossible for the Committee on Foreign Relations, it was impossible for any other general committee of this body, to enter upon, and still more impossible to exhaust, the field of inquiry which this Committee proposes to itself."

Subsequently, Mr. Hoar said that "the question of annexation never entered into his mind in connection with the forming of this Committee."

A glance at the terms of the resolution under which the Committee was constituted shows that any friendly idea whatsoever was far from the mind of the mover (Mr. Hoar), as it was from the minds of the Republican majority in the Senate. The resolution bristles with unfriendly purposes. It first directs attention to the competition of the Canadian railways and canals with our railways and canals, and "the prospect of the displacement of any existing industries of the United States by industries established there." It then calls for a general investigation of any claims we may have against Great Britain by reason of infractions of international law and treaties by her dependencies in North America. That this extra diligence in searching out causes of complaint against Canada was in the nature of ammunition for the Presidential campaign, is made manifest by the altered tone at present prevailing. The terms of the resolution make it clear that Mr. Hoar did not entertain the thought of annexation in connection with the formation of the Committee. His words quoted above show that he does entertain it now, although it may not have shaped itself in any definite way in his mind. Even Senator Frye, the exasperated fisherman, had nothing to say of Canada which need wound the most susceptible spirit. He favored the continuation of the Committee as a means of getting up tables of statistics as good as those which Canada already has.

Senator Sherman was strongly in favor of keeping this Committee on foot, because he believed that the political union of the two countries was their eventual destiny, "unless a state of hostile feeling is aroused between the people of the two countries sufficient to prevent the natural mingling of these two populations under one government." He believed that this was the prevailing idea in the United States all along the border west of Lake Ontario, and, for that matter, north of Lake Ontario too.

Senator Blair of New Hampshire took this latter remark as an implication that New England held views different from those of the rest of the country. Speaking for one New England State only, he wished to say that New Hampshire was in favor of union with Canada whenever Canada was in favor of it. As to the competition of Canadian industries, he wished it to be understood that New Hampshire was not asking for protection. What she wanted was free raw materials. We quote Mr. Blair's words upon this point, because they are quite in harmony with the views so ably presented by ex-President Cleveland in his message to Congress in December, 1888. Said Mr. Blair:

"We need in New England the raw material which is outside of us, and which is more accessible from the British provinces than it is from Pennsylvania, or from Ohio, or from West Virginia. We are in immediate contact with vast stores of the metals and of other raw materials, as well as fish in the sea, that should come to New England for her single prosperity with none of the encumbrances of a tariff or of prolonged transportation, which is equivalent to the same thing."

That will do very well for a speech when there is no tariff bill under discussion, but it would not be safe to count upon Mr. Blair to vote for free coal, or free ores, or free anything when the pinch comes.

The outcome of the debate was that Mr. Payne withdrew his motion to discontinue the Committee. So Mr. Hoar and his colleagues can go on with their work, whatever it is. We may be pretty sure that it will not be alarming to either country. The sun went down on our wrath on the 6th day of November, but it did not rise on the same on the following day.

THE CRISIS IN FRANCE.

M. GAUVAIN, a French publicist of some distinction, has an article with the above title in the last number of the *Political Science Quarterly* which is very interesting as a picture of the present political situation in France, and of the causes of the Boulangist movement. Many others like it have appeared in various periodicals during the past two years. One may be found in almost any number of the *Revue des Deux Mondes* from the pen of M. de Mazade.

The French, ever since the days of St. Simon, have been extremely skilful in sketching scenes of moral and political confusion, such as France has so often presented to the world during the past century. M. Gauvain exposes every party and nearly every group in rapid succession, its history, its weaknesses, its perfidy and incapacity. The following description of he Chamber of Deputies, as now composed, is very graphic, but most Americans will wince a little on reading it, and ask themselves whether what he is sketching is really, after all, the French legislature alone, or every democratic legislature everywhere:

"At least nineteen-twentieths of the deputies are absolutely mediocre personages, skilful perhaps in their professions, animated probably by the most honest intentions, but totally ignorant of the affairs of Government, of the real interests of the public, of internal administration and of foreign politics. Their ideas, like those of most uneducated persons about matters of which they know nothing, are preconceived, and are maintained with the obstinacy of ignorance. They have read their history in violent partisan papers, and have picked up their political experience in their clubs or in the cafés. They come into power with no other preparation for public business than the exercise of a private calling, revolving in their heads a multitude of projects which will not stand a moment's scrutiny, but which they believe are destined to regenerate the world. They return to private life just at the moment when they begin to perceive that their reforms are worth little less than what they have destroyed. Enlightened by experience, they would perhaps have grown wiser had they remained in power; but their constituents, electors or colleagues, as the case may be, enlightened also by experience, refuse them further confidence. Their appearance in public life has served only to confuse the situation, and to aggravate the evils which they were sent to remedy. They go to swell the ranks of the disappointed and ambitious, pose as unappreciated statesmen, and devote their energies to obstructing the career of really eminent men whose superiority imperils their own return to power. The recovery of power is their single aim and the supreme motive of their conduct. The most active are the most influential. Intrigue takes the place of talent, *savoir faire* of knowledge, and phrase-making of eloquence. Each Deputy makes himself the broker of his constituents; for, in order to be elected, he has piled up promises. Once chosen, he gives his support to the leader who will furnish him most plentifully with the means of retaining the good graces of his electors; that is to say, of paying them in favors, places, crosses, or pensions. Under this system the credit of cabinets is quickly ruined and the Treasury emptied."

We know all about this sort of representative. We see him every day, but we do not, as the French do, allow him to ruin the Government, or threaten us with revolution whenever he "fails of reëlection" or cannot get his claims recognized by the Executive. We have tied him up in such fashion that his bad temper makes but little impression on us. In other words, we have, by our Federal and State Constitutions, so restricted his power over the Executive, and his power over the citizen, that he is a comparatively harmless person.

No reasonable man can doubt that if our Congress had the power over the Executive possessed by the French Chambers, we should, allowing for difference of traditions and manners, pass through very much the same political experiences as the French. In every session of Congress, groups of "disgruntled" members, irritated by refusals of patronage or want of obsequiousness on the part of heads of departments, would combine to compel the President to provide himself with a new Cabinet, and when their annoyance became

extreme, to compel him to resign himself. We doubt very much indeed whether, under the French Constitution, either Lincoln, or Johnson, or Hayes, or Cleveland would have been allowed to complete his term, or whether a single Cabinet since 1861 would have survived the first year. The French Constitution is an impossible arrangement for a democratic republic, and a very difficult one for a limited monarchy. There is no sign on the horizon that within any measurable period the composition of democratic legislatures will improve. On the contrary, all democracies show a greater and greater disposition to confine the work of legislation to genuine representatives of "the plain people"—that is, men who are in full sympathy with the mass of the voters, but not superior to them in fortune or education. In short, "the average man" is becoming everywhere more and more the ruler of the world, and the average man's equipment for the special work of law-making is very slender indeed.

What does most to make the condition of France seem hopeless is the absence among the more intelligent and patriotic men of all serious and organized attempts to adapt the Constitution to the actual needs of French society as they have been revealed by the experiments of the last twenty years. The press teems with books and articles like this of M. Gauvain's, containing eloquent and vivid descriptions of their country's unhappy plight, and of the crimes and shortcomings of the Radicals; but we look in vain for the suggestion of a definite reform about which the discontented voters can rally. These articles generally end as M. Gauvain ends, by giving us generalities of this sort:

"France longs only for repose, at home and abroad. She is frightfully weary of the harangues of her Deputies and of the agitations of her petty great men. She is searching for the arbiter of her divisions. She may be infatuated with the first adventurer who presents himself, without asking whether he will prove to be a Monk or a Cromwell. She will choose more worthily if a worthier offers himself. The electors of 1889 will be judges of their own cause. Their elected representatives, intrusted with the termination of a complicated crisis, will do well to remember their forerunners of 1789."

Of course there ought to be hundreds of agitators of the better sort in the field now preparing the electors to be "judges of their own cause," and offering them a specific mode of escape from their present difficulties. But there is nothing of the kind. Boulanger is the only man who has a plan, and what it is he refuses to explain clearly until he has been armed with semi-dictatorial powers.

THE CONSTITUTION OF JAPAN.

THE proclamation of the new Constitution of Japan was made in Tokio on the 14th of February with imposing ceremonies and extraordinary pageantry. The national rejoicing, so extensive and hearty, is proof of the anxiety and eagerness with which the classes that form public opinion have awaited this imperial concession. In reality, the action of February 11, 1889, is but the long-delayed fulfilment of the promise made by the newly-inducted boy-Mikado in the castle of Nijo, in Kioto, in 1868, and reaffirmed in the imperial rescript of October 12, 1881. Although a new generation has sprung up and almost completed its majority since the earlier date, it is remarkable that the men still at the head of affairs are mainly those who took part in the famous *coup d'état* of January 3, 1868, which reversed the order of things prevalent during six centuries, and restored the ancient political system. Kido, Okubo, Iwakura, and others have died, some escaping, some falling under the sword, which, worn for a millennium by the Samurai order, could not be sheathed in a day. How unsleeping are the traditions of feudalism and how strong the temptation to private war, was illustrated on the very day of the proclamation granting the Constitution. Arinori Mori, the Minister of Education, who seventeen years ago memorialized the Government for the abolition of the custom of wearing swords, and in favor of freedom of religion, fell under the assassin's knife. That the dastardly act was non-political in its character, and that the present Government is a firm and admirably balanced union of the radical and conservative elements in politics, form most happy auguries for the success of representative government in Japan.

On one point all the leaders of public opinion and members of the Government have been and are strenuously agreed, and that is the inviolability of the Mikado's person and the stability of the throne as the source of honor and power. The traditions of at least fourteen centuries of history, backed by ages of tradition, are to continue uninterrupted. The strongest force in the national life is again, as of old repeatedly, to be utilized in furnishing centre and cen tripetal attraction in the enlarged orbit of Japanese progress. Indeed, it was in the name of his ancestors, and on the day sacred to the reputed founder of the empire and the imperial line of Mikados, now the oldest political dynasty in the world, that Mutsuhito promulgated the new charter.

The Constitution, which combines "imperium et libertas," is not a "subtle organism," but a "work struck off at a given time by the brain and purpose of man." Its makers have carefully studied the political systems of Germany, Great Britain, France, and the United States, though by no means neglecting their own traditions. It remains for the competent scholar to say how far the instrument accords with the native genius and past procedure, and hence to gauge the probabilities of quick failure or slow success. Of the 332 articles, under the general divisions of the Empire, Law of the Houses, the House of Peers, Law of Election of Members of the House of Representatives, and the Law of Finance, seventeen articles of the first chapter relate to the Emperor. "The empire of Japan shall be reigned over and governed by a line of Emperors unbroken for ages eternal." The throne is to be succeeded to by male descendants. In the list of 123 Mikados, from 660 B. C., ten or eleven have been females, the last Empress reigning from 1763 to 1770. Henceforth, from the time of the first assembling of the Diet, the Emperor will share legislative powers with it, or, when the Diet is not sitting, will issue imperial ordinances in place of law; though even in great emergencies these ordinances are not to conflict with existing law. The executive authority of war, peace, treaties, command of the army and navy, bestowal of amnesty, pardon, titles of nobility, etc., belong to the Emperor.

In chapter ii, which treats of the rights and duties of subjects, we have the points most important in respect to popular liberty. The rights of trial according to law, of liberty of abode and of changing the same, of domicile as against search, of secrecy and inviolability of letters, of property, of religious belief, of freedom of speech, writing, and public meeting are clearly set forth. These rights, in so far as military discipline permits, are also accorded to sailors and soldiers.

The Imperial Diet consists of a House of Peers composed of elective, hereditary, and nominated members, and a House of Representatives chosen in the cities and prefectures by male electors thirty years old and paying $15 yearly tax. The voter must write on his ballot his own name and the name of the person voted for, and minutes of voting at every poll must be kept. The directions for voting are numerous and minute, and apparently most difficulties likely to arise have been provided for. The Diet will be convoked annually and will sit three months. When ordered to dissolve, a new election will be held and convocation take place within five months. One-third of the members present forms a quorum. The House of Representatives will number about 300 members, or one to every 125,000 inhabitants, or about one to every 2,000 possible voters. The deliberations of both houses will be public, and the Ministers have a seat and right to speak on the floor. The present Ministry of State and Privy Council will remain. The administration of justice will be public and in the name of the Emperor, but the courts are to be organized according to law, and the judges are not to be removed except by way of criminal sentence or disciplinary punishment. In the law of finance, we find that the expenses of the imperial house are independent of the Diet, except for increase. When the Diet cannot be convoked, in case of urgent need, for the maintenance of public safety, the Government may take all needful financial measures by means of an imperial ordinance, the latter to be submitted to the Diet at its next session. In other words, the Government can, for a year at least, make itself independent of the Diet, and tide over a disagreement between the legislative and executive bodies. The Diet receives petitions only when written in the form of a prayer. A member, if supported by thirty of his fellows, may question the Government or move an address to the Emperor. No petition to amend the Constitution can come before the Diet.

At the present time in Japan there are 882,517 persons who pay over $10 annually in taxes, of whom 802,895 have the right both of voting and of being elected to the local assemblies in which 2,172 members sit. We calculate that about 600,000 natives will

vote for national representatives. These experiments in local government have been carried on about ten years, and have proved reasonably successful, besides being good training schools. The day of national election is fixed for July 1, annually, and it is highly probable that parties will at once begin to form, the voting lists be made, and the Diet be called to meet in the new buildings already begun in Tokio, by December 1, 1890.

Considering that in its central principle the new Constitution roots itself in all the past of Japan, and that the provisions for popular suffrage are but the expression in the form of ordered law of the claims of the men who, in leading the national movement in 1868, did but embody the desire of centuries, there seems every reason for hope of success.

A PRELIMINARY WALK THROUGH THE PARIS EXPOSITION.

PARIS, February 26, 1889.

I PASSED the morning within the forbidden palisades that hide from the public all the wonders in course of preparation for the Universal Exposition. It was snowing. The thick-falling flakes veiled the gay decorations of plaster of Paris, and besprinkled with treacherous coating the mud pools dotting the Champ de Mars—a discouraging prelude for one who came to catch the vista of a summer fête. As to the general plan of the Exposition, however, there is no danger of the visitor getting confused. He can take in the disposition at a single glance. Turning his back on the Eiffel Towel, he is surrounded with distinctive and well-defined buildings: he has on his left the Beaux-Arts; on his right, the Arts-Libéraux; before him, the principal façade of the galleries assigned to trades and industrial callings, behind which is the Machinery Hall that stretches the entire width of the Champ de Mars. The architect of the principal façade happily inspired himself with souvenirs of the one of 1878. Besides, he has achieved what is always a great difficulty with grouped structures, the affirmation of a central point for the eye to rest upon. A dome, noble without being pompous, forms that centre, and frames well within the arch of the Tower and the axis of the Jena bridge leading to the Trocadéro. Its outer decorations do not betray too flagrantly the ephemeral grandeur; as for the interior, it is an interesting echo of the dome of St. Sophia, Constantinople. Running the anterior length of the principal façade is a portico broad enough to give hospitality to cafés, restaurants, picturesque shops, and the crowd of an exposition. The handsome buildings "Les Beaux-Arts" and "Arts-Libéraux" are alike crowned with cupolas bearing the gilt initials of the French Republic. The roof of each palace is an artistic patchwork composed of 50,000 mosaic tiles of varied forms and colors, exquisitely irregular in arrangement. The chief feature of the Beaux-Arts is a very curious stairway making four revolutions, and ascending under the dome to the circular gallery above. The show piece under the dome of the Arts-Libéraux is a gigantic balloon, forming the centre of the exhibition of the retrospective history of labor.

The Machinery Hall is in communication with the industrial galleries. This edifice has been almost as much talked of in the world of builders as the Eiffel Tower. Each of the piles that support the structure has the importance of the pier of a bridge, and bears the weight of 400,000 kilogrammes. There are twenty of them. The inauguration will take place in this building, which is so spacious that the Palais de l'Industrie in the Champs Élysées could move about in it.

This summary synopsis, not including the department of Agriculture, shows that the classification of exhibits is based on the principle of "groupes sympathiques"; that is, things of a kind contributed by various nations are gathered into one department. This mode of classification has been preconized by M. Berger as having the advantage of avoiding surprises for the visitors. It has another advantage—that of discreetly turning an awkward point by rendering less apparent the *unofficial* presence of the best part of the European nations. Switzerland, Greece, Servia, Monaco, Norway, Denmark, and Morocco alone adhere officially. Egypt had the good intention to do so, but the financial situation of the country was inefficient, and the good-will had to be made valid by private individuals. Germany received the first invitation from France, which Bismarck refused neatly—his refusal, however, being modified by the statement that it was not determined by the date of the Exposition, but by reasons purely economical. Austria very naturally declined official attendance; but the Emperor assured all possible assistance to private enterprises in the monarchy. Signor Crispi explained that Italy's abstention was influenced by no political causes, but by reasons of economy. England's official participation was refused by a diplomatic though significant communication from Lord Salisbury, alleging the date: the Prince of Wales, as a constitutional prince, could not give vent to his sympathies on that occasion. But Great Britain is the land of private initiative, and her flag floats over 12,500 yards in the Champ de Mars. Among the governments that refused official attendance, the Czar and England are the only ones who gave the true reason for so doing. The anniversary of the convocation of the States-General in 1789 recalls a political progress which Russia has no ambition to emulate. Spain, Portugal, Belgium, Holland, Rumania have not, perhaps, that scruple at heart; they followed the example of the great Powers, and declined official participation. The Latin races of South America greeted in the most cordial manner the pacific manifestation. Japanese could not fail to be at the rendezvous. Altogether, there are but four nations missing—Germany, which finds it would not pay; Sweden, too poor; Turkey, preoccupied at home; the Celestials, not yet recovered from the war.

It is interesting to compare the mode of classification of 1889 with that of 1867 and 1878. In 1867, Prince Napoleon was President of the Imperial Commission, and to his imagination was due the ideal form of classification, always the *bête noire* of an exposition, though the outsider does not suspect it. His idea was, to construct a building which transversely would present exhibits classed according to nationality, and longitudinally according to the similarity of species. M. Le Play adopted the idea, and proposed an ovoid form for the building, which was adopted. If unsightly in an artistic point of view, squatting like a gigantic gasometer, the interior disposition was perfect. Each nation was isolated in its section, and the visitor who followed the concentric galleries could pass in review all the objects of one kind without getting too far out of his way. In 1878 the rectilineal form was decided upon, and the buildings were remarkable specimens of the classic architecture of the second half of the nineteenth century; but when the rational classification illustrated in the Exposition of 1867 was attempted in the buildings, the difficulties were found insurmountable. So the rigorous and mathematical classification had to be abandoned; nations were ranged one after another, and comparison between French products and similar ones of other peoples was impossible. Such roundabout promenades were required that the fatigued student or visitor was unable to retain in his memory what he saw.

To compare further the characteristics of the three expositions, it must be remembered that what contributed the original feature of the Exposition of 1867 was the creation of the famous tenth group. The ensemble of every exposition is divided into nine groups: works of art, education, furniture, tissues, extractive industries, metal industries, agriculture (including viticulture and pisciculture), horticulture. The creation of the tenth group, called the Emperor's group, was inspired by a speech of Mr. Gladstone's: "The nineteenth century will be the century of the working people." The object of this addition was to gather all the documents most calculated to better the physical, moral, and intimate surroundings of the laboring classes. This group had a section to itself—the importance of a nation. Strange to say, it was omitted in 1878, when a delegation of workingmen reminded the Republic of the omission. This demonstration compelled the State and the town of Paris to share the expense of an extra building for their accommodation. But the new building was put outside the chief enclosure, and consequently passed almost unnoticed. When preliminary arrangements were made for the Exposition of 1889, delegates from one hundred and four workingmen's unions took steps in time to obviate a repetition of what they considered a slight. They asked of the Municipal Council a subvention to organize on the Champ de Mars an international exposition of the working classes. The sum granted was 5,000 francs—much too meagre for getting up the desired exposition; but it is put aside to serve in 1890, when the workingmen will have their exposition all to themselves.

The exhibition of the "Retrospective History of Labor" takes the place in a measure of the tenth group—a homage to the workingman without the philanthropic element. It simply reviews the gradations of his craft through centuries down to the present time, without reference to social amelioration. The ensemble of this department will be extremely picturesque and full of surprises. There will be seen examples of the first essays in oil-painting; the transition between the different modes of sculpture; the history of the book; the history of the press, transformation of newspapers, etc. The section devoted to traction will be perhaps the most curious—beginning with natural traction, man carrying man; then beast carrying man; traction on water, in the air, on land. Then will be unfolded a complete and thorough history of military art, from primitive strongholds up to modern forts; also, full illustrations of different military manœuvres.

Twelve yards more of the wonderful Tower, the monster that was going to dishonor Paris, and the colossal structure will have reached its full measurement—three hundred metres. Artists and lovers of archæology may be disappointed that their petition against its erection was not heeded by the Government, but science is grateful. Savants from all parts of the world are waiting to be assured of the possibility of attempting in the observatory on the summit experiments long dreamed of. The lifts will not be in place before April. There will be six—one in each pile—ascending to the first platform; two lighter ones will

complete the journey to the cupola, which will be accomplished in seven minutes and cost five francs. With this tariff M. Eiffel expects to cover his expenses. The enterprise cost him between five and six millions of francs, and he has been aided by the State to the extent of 1,500,000 francs taken from the forty-three millions voted for the works of the Exposition. To square his accounts with the State, and later with the city of Paris, M. Eiffel has the benefit of the proceeds of the tower during the Exposition, and the right of use for a period of twenty years after, when it becomes the exclusive property of the city of Paris. Then only, if the future generation has the same æsthetic views as the signers of the petition, and if the then municipal council proves a faithful echo, will the tower be demolished. The remarkable precision in the calculations was commented on at the time the foundations were laid—how the four pier-shafts, each weighing four hundred tons, were constructed piece by piece from the foundry without a single misfit. It seems the work of enchantment, for no débris lies round the giant's legs, and we wonder even how the pieces, ready numbered and awaiting their flight, are to reach the summit. Nothing is lost in the formidable construction. Every scrap—broken pins, screws, riveting nails—is transformed into candlesticks, inkstands, and other articles, to be sold as souvenirs of the Exposition. The director of the "Printemps" (a large dry-goods store) is the purchaser of the rubbish, rivalling Talloy, who retailed the remnants of the old Bastille, and M. Picard, who reduced the ruins of the Tuileries to paper-weights. Speculation sometimes affects a singular form in France. A half-million of pocket-handkerchiefs, stamped with the image of the Tower, are in circulation, worthy a place in future collections of kerchiefs by the side of the same article showing the features of "The Liberator of the Territory."

A perfect village is growing up under the shadow of the Tower. Here are grouped all the pavilions of the South American States, that of Monaco, and of several private corporations, including the pavilion of the press—a dainty bandbox. A special pavilion is devoted to the requirements of infancy. But the main street in that capacious village is the row due to the inventive genius of Ch. Garnier, architect of the Opéra, and the learned collaboration of archæologists. It is nothing short of the retrospective history of Home, beginning with a shapeless block of stone pierced with holes, the dwelling-place of the first sons of Adam, and concluding with the *chic* of modern civilization, illustrated by the luxurious pavilion reserved for President Carnot. There are forty-nine houses in all; each dwelling, in the character of the period and civilization it represents, is surrounded with indigenous flora and fauna, and equipped with accessories common to the life of the epoch and clime. To force the illusion into realism, Jambon, scene-painter-in-ordinary to the Opéra, is busy giving the local color. Altogether, it is in the minute care of details that we find the enticing promise of the fête—such bona-fide work and poetical imagination have been consecrated to an ephemeral vision. I saw on the way to be lifted to the pinnacle of these palaces, which in less than a year will fall under the pickaxe, decorative figures which, were they in marble instead of plaster, might be immortal.

Leaving the gardens of the Champ de Mars, which seem to stretch a hand to the amphitheatre like parterres of the Trocadéro, the visitor will enter the galleries of Agriculture stretching along the Quai d'Orsay, between the Pont de Jéna and the Pont des Invalides—a distance of 30,000 yards—not such a meagre allotment for a branch of industry supposed to be on the decline in France. On his way he will visit in the annexed buildings the exhibitions of navigation, of life-boats, of fisheries, etc., reaching at the end of all the department of French colonies—an Eastern tableau after the manner of Decamps. The visitor has a right to be fatigued after this lengthy promenade. A hundred snow-white Egyptian donkeys, low and convenient, richly caparisoned in red, will serve as palfreys for fatigued dames to span the distances—an æsthetic improvement on the mode of transportation during former expositions, when tired women had to resort to the doleful conveyances known as Bath chairs. But a more rapid transit will be found in a miniature narrow-gauge railroad.

Just opposite, on the other side of the Seine, and in close proximity to the row of M. Garnier's houses, is a panorama intended to produce the illusion of being on board a transatlantic steamer leaving Havre. It is curious to note the mania for panoramas; in face of the uncertainty of covering expenses during a six months' exposition, fifteen applications have been refused. Two canvases only will stand on the grounds, the one just mentioned and *Le Tout Paris* at the furthest extremity of the Esplanade des Invalides. The latter is a kind of album of Parisian personalities met by chance on the boulevards or promenades or grouped in club windows. For that matter, pages might be written, if space allowed, to enumerate all the amusements in preparation for the public. To entice the crowd to the Champ de Mars, a novel idea originated in administrative and financial circles the other day: the issue of two millions of tickets at twenty francs a piece, good for twenty entrances to the grounds. The little operation is not without interest. These tickets, independent of admission, have another value, that of lottery tickets —3,500,000 francs' worth of prizes will be drawn during the six months of the Exposition by the lucky numbers. This is not all. Each ticket-holder will be able to boast, at some time or other, that he entered the Exposition of '89 free, for his twenty francs will be reimbursed during the seventy-five years to come. Some favored ones will get their money back in 1890, and the grandchildren of many will claim the cost of the twenty festive visits their grandparents made to the Universal Exposition of 1889.

LE COCQ DE LAUTREPPE.

THE IMPERIAL LIBRARY AT ST. PETERSBURG.

ST. PETERSBURG, February 18, 1889.

I RECENTLY read a letter in the *Nation* about the Imperial Library in Berlin, which touched my feelings as a fellow-sufferer, there and in St. Petersburg at another Imperial Library. I once spent half an hour in the Berlin Library. I saw no books; I found that that was out of the question without a certificate from a University professor, the American Minister, or some other person who knew nothing about me. It seemed simpler to step into the other end of the building—the palace—and ask amiable Emperor William I. to be one's surety. So I admired learning as exhibited in five fanciful rapier wounds in one cheek of a student who entered, went round and gazed at three more wounds on his other cheek, and walked away content, merely wondering if the library owned such commonplace implements as dust and scrubbing-brushes. I thought that I should get books enough in St. Petersburg.

There are plenty of books—in fact, about twenty miles of shelves and a million and a half of books (not counting MSS.)—in the Imperial Public Library. They are so numerous that they have quite got the upper hand of the librarians and the public. The librarians are extremely obliging, but the whole system is so radically defective that individual effort can effect but little. There are 300 to 400 visitors a day, on an average—120,000 a year; and the numbers are increasing so fast that the great reading-room must soon be enlarged again. There are a good many crying wants; but the real shrieking, howling want is a catalogue—and a card catalogue at that. At present, there is, practically, none at all. The method of procedure is as follows: at the entrance door the soldier who takes your cloak and shoes gives you a sheet of paper on which he notes the number of your peg. You will not be allowed to reclaim your garments and leave the building unless that paper bears the proper cancelling stamp to show that you have returned all books. On this paper you write your name and the number of your card. This card, by the way, is issued to you on your personal signature with address, and without an appeal to professors, ministers plenipotentiary, or other potentates. Herein this library decidedly scores a point over Berlin. On your paper the attendant at the desk writes the titles of all your books, after you have got them. After you have got them! That's the rub. At the top of the grand staircase, outside the reading-room, on the landing, stand some desks provided with some catalogues, in divisions such as: Russian, Foreign Literature, Dictionaries, and a few more. As it is necessary to go through the alphabet several times, in some of these leaflets, in order to make sure that you have not overlooked your book, the search is sometimes lengthy, and at certain seasons and hours there are more candidates for catalogues than catalogues. If you find your book, you write its name, author, date, number (if given), etc., on a small slip of paper, adding your card number and the date. If you do not find it, and know enough to ask for them, you may have another series of combined leaflets, which are issued from the desk on special application. These consist of a couple of yearly lists of acquisitions (foreign), 1856-57, and of half-yearly lists beginning in 1863 and ending, after some irregularity in issuing, with No. 19, containing the additions for 1882-83. After that date there is a blank.

When your slips are ready, you pass them in at the proper opening of the desk (for periodicals or books), find a seat near at hand if possible, or lounge about and wait for the books. No women are employed about the establishment, and there are no angelic little boys to wait upon one, as at that blessed Boston Public Library. (I used to think those infants imps sometimes; I am now firmly convinced that they were winged cherubim.) No. Each person takes his own books from the desk. As not a single dictionary, encyclopædia, or other reference book can be had otherwise than by the regular official plan, this sometimes means not a little physical as well as mental labor! The paper received from the hall porter must be presented when the books are taken; the title of each is carefully noted. A written or stamped receipt is given, in bulk or as each separate volume is returned.

If the books desired happen to be in the reading-room section, they are delivered promptly. If elsewhere, they can only be had after three P. M., or on the following morning—*provided*, the application is handed in before one o'clock, the ordinary hours being from ten A. M. to nine P. M. If the next day chances to

be a Sunday or holiday, you cannot have the book, although the library is open from twelve to three P. M., but must wait until the first ordinary day. The building is hermetically sealed for a week at the Christmas holidays, about the same length of time at Easter, if I recollect aright, and for several days at another season, when they are "taking account of stock." It is as well not to feel in haste at such seasons; but human nature is contrary, and sometimes one does pine for a book just then.

Certain books are never given out for reading: of course this means in the reading-room. No book is ever given out for home reading—by regulation. Of this and other points hereafter, when the case, so far as the general public is concerned, has been stated. Setting apart books under censure, unique copies, works of a private nature, and works in course of publication in numbers, as aside from the question, the inaccessible section includes "romances, novels, poetical and dramatic works in living tongues." Daily papers and the monthly magazines are given out, however (the latter in temporary bindings), as soon as received. But, although this library, like the National Library in Washington, receives by law *everything* that is printed in Russia, the books do not come directly from the authors; they are forwarded from the Censor's office, and are sometimes days and weeks on the road. The road is not long—about one block. I was informed at the Library that this was owing merely to their allowing matter to collect into heaps convenient for forwarding. It was upon the occasion of my asking for the latest number of a Moscow periodical, and receiving one two months old. With foreign books the process is longer, naturally, as it is everywhere. Time must be allowed for selection, ordering, etc., etc. And I suppose that binderies operate pretty much on the same plan all over this planet, so that I need not discuss that melancholy point as a peculiar feature of this institution. A complaint has recently been made that only 16,000 rubles out of the yearly allowance for the Library of 82,649 rubles are spent on books, and that chiefly on valuable manuscripts, leaving but little for the acquisition of new foreign works.

Novels are not allowed—probably lest the reading-room should be filled with the readers of light literature, who would crowd out others. But novels are published first, in parts, in the monthlies. The result is that people go there early, take every number of the novel monthlies for the year at once, and read at their leisure. At first I tried to wait until these people got tired or hungry, when there was a serious article in one of the numbers which I desired to read. That was before I understood the powers of endurance of the Russian stomach and brain. After trying one of the numerous circulating libraries, paying for fresh periodicals, and getting only one in the course of two months, I tried the plan of going to the Public Library at ten A. M. and asking for four times as much as I could read in a week, in case I might wish for it within a few hours. This, however, is not convenient, and periodicals, which are very dear, cannot be bought in single numbers, but must be taken for a year, six or three months. This is well enough for permanent residents, who have some place to store books.

One morning at ten o'clock I asked for a book. "You can have it after three o'clock this afternoon." "But I neither wish to wait here until three nor to return." "To-morrow, then." "To-morrow is a holiday." "The next day." "But I want it *now!*" We argued the question. I wound up with: "We do these things much better in America." "How?" I gave a brief but vigorous sketch of the American idea of a free public library, and several attendants listened in amazement at the liberty and peremptory ways of readers. I sat down to read, and ten minutes later the unattainable book was softly deposited at my elbow. I was still full of the subject when I met the director of the library on my way down stairs. I forget his numerous distinguished titles: the Most Amiable of Librarians will suffice. "Can I help you in any way to-day?" he asked, as he paused to shake hands. "Yes, please to tell everybody here to give me whatever I want, and when I want it, without waiting until afternoon or the next day." "But no library can do that." Then I favored him also with a brisk American sketch, which included the small boy who is expected to bring the best-hidden book to your hand in ten minutes at latest. "Boys!" he gasped; "they must make a terrible mess." "Not at all; and the advantage of boy runners is, that they are supposed to have wings on their heels. And if they have not, one can scold them better than one can a boy of larger growth." "But we have so few readers, that we cannot serve fast." "I should have argued just the other way," I retorted. The amiable Director admitted that I seemed to be reasonable, on the whole, and gave his orders. One of the first results was, that an attendant in the reading-room suggested my consulting my particular work of that date on the shelf upon the street floor, instead of wasting from twenty minutes to half an hour every time in mounting the stairs myself and having the big volumes brought up. I gladly availed myself of this forbidden privilege, under the eye of the sub-librarian of that department, until I happened one day to encounter the chief librarian, who, to my amazement, treated me as an interloper. A lengthy discussion ended in my going to the door and ordering the soldier to conduct me to "His Excellency" the Director. Making my way through surprised workers in the depths of the building, I reached the sanctum, stated the case, and was sent back with the amiable general order that I was to do just as I pleased. Nevertheless, I always stoutly refused to avail myself of the guardian soldier's invitation to roam among those precious ancient books alone. I confined myself to the librarian's hours of 11:30 to 3.

I relate this incident because it has an important bearing upon another feature of my experience later on. As I have said, the rules allow no books whatever to be taken home. Nevertheless, if one knows a librarian who will take books on his own name, rendering himself responsible for them, one can get plenty and keep them at pleasure. Also, one can refer to foreign belles-lettres, which is otherwise impossible, through the same intermediary. Last summer I was compelled to consult some foreign books. I made a special trip to town. The Director was away; ditto the head librarian; a friend on whom I depended would not arrive before five o'clock, "if at all." The only librarian on hand flatly refused to allow me a sight of the books: "It was against the rule; he did not know where they were; it was not in his department, and etiquette forbade his touching anything which did not belong strictly to him; and—he did not know who I might be"; "he remembered no orders about me." "These soldiers and others down stairs and the attendants in the reading-room all know me," I said. "I have lost my breakfast, and now you ask me to wait three hours and a half, on the chance of Mr. X. coming, travel back another thirty versts, and lose my dinner, perhaps in vain!" He was not in the least moved, but I was beginning to be, when the librarian with whom I had had the long dispute about the books on the shelf, and who had afterwards been almost oppressively kind, made his appearance on the stairs. He promptly suppressed my enemy, who was then willing to relax, carried me off, invaded another man's department in spite of etiquette, and gave me so much that I was afraid that I should lose my train through too much attention, instead of through too little.

This will serve to show that the people at the Imperial Public Library mean to be kind, but that they do not know how. The building is magnificent, and full of treasures. A stroll through its departments with the special librarians is a rare treat—for instance, an explanatory trip through the rooms where the old parchments and sheepskins are kept, with Dr. Abraham Harkavy, the Hebrew scholar, who is as agreeable as he is learned, to explain how he proved the forged character of those documents which had cost so dear, not to mention other departments and librarians. That is the exhibition side of the institution, and the learned side. As such, it is eminently satisfactory. But the lack of a promptly accessible reference collection and of any catalogue renders the working side of the institution a kind of lottery, which inspires one with a sort of dread. One does not feel like wasting time in "tackling" it often, on the chance. As I pass the fine building on chilly days, and glance up at the long row of ancient philosophers (in bronze) which decorates the front, I find myself involuntarily addressing them in familiar terms: "Poor fellows! They have done the best they knew how by you, even if it is rather a cold post; but then we moderns inside are almost as much 'out in the cold' as you are in your niches outside!"

Such is one of the results of living in Boston, where books almost walk about the streets begging to be read, like the little pig with his knife and fork crying, "Come, eat me!" Were I a New Yorker, I should be far less spoiled and critical in the matter of libraries.

ISABEL F. HAPGOOD.

THE SEVIGNES IN PROVENCE.

PARIS, March 7, 1889.

WHENEVER I see the name of Mme. de Sévigné on the title-page of a new book, I cannot help reading it. I am sometimes rewarded—for instance, in the case of M. Gaston Boissier's recent notice. The Marquis de Saporta gives us now a volume entitled 'The Family of Mme. de Sévigné in Provence, from inedited documents.' The Saportas are an old family of Provence; and the daughter of Mme. de Sévigné, Mme. de Grignan, spent the greater part of her life in that province. The volume has two portraits, one of Mme. de Sévigné, from a picture made by Mignard for Mme. de Grignan, left by Mme. de Simiane (the daughter of the last named) to her own daughter, Mme. de Vence, and now in possession of the Countess de Lucay (born De Vence); the other is the portrait of Mme. de Simiane, very stern-looking, somewhat in the style of an old Mme. de Maintenon, in black clothes and a widow's cap, with her grandchild Julie de Vence.

The new volume, which bears every mark of great inexperience in the art of classifying and developing a subject, but which is nevertheless interesting, begins with a long dissertation on the iconography of Mme. de Sévigné. The author, after interminable explanations, concludes that there are only four authentic paint-

ed portraits of Mme. de Sévigné. His explanations are very confused, and his conclusions do not seem to me to be perfectly sure. I will say, in passing, that it is generally easier to find a real resemblance in engravings of the time than in paintings, for the engravings are made either from special drawings or from the best paintings, while the paintings are often retouched and spoiled, besides not seldom being bad likenesses from the beginning.

M. de Grignan had not an easy task in Provence during the last ten years of the life of Mme. de Sévigné. He was very prodigal, and we know that his mother-in-law tried in vain to moderate his expenses. Some of his expenses were compulsory: he often had to entertain as governor important personages. His political difficulties were great also. He was obliged to execute the orders of Louis XIV. in Avignon and in the principality of Orange; he found himself in antagonism at the same moment with the Pope and with the Protestants of Orange. It became also his duty to execute the edict which revoked the famous Edict of Nantes, as there were in Provence, chiefly in the mountainous part of the region, nearly eight thousand Protestants.

Mme. de Sévigné was at Grignan in 1694; her grandson, the Marquis de Grignan (whose life has been the subject of a volume by M. Frédéric Masson), was married to the daughter of a rich financier, Arnaud de St.-Amans, who brought him a dowry of 400,000 francs, a very large sum for the time. Mme. de Sévigné gives a very pretty account of the marriage ceremonies to Coulanges. Mme. de Grignan, her daughter, in speaking of this marriage of her son, is said to have exclaimed: "You must have manure on the best soil." A second marriage followed soon: Pauline, the beloved granddaughter of Mme. de Sévigné, was married on the 2d of September, 1695, to Louis de Simiane, Marquis of Esparron, first gentleman of the Duke of Orleans (who was afterwards Regent). Only a few months later, on the 17th of April, 1696, Mme. de Sévigné died at the Château de Grignan. Her remains were kept there, in the family vault, till 1793, when the castle was partly demolished and all the tombs were emptied.

The death of Mme. de Sévigné became the signal for all sorts of troubles and misfortunes. The young Marquis de Grignan, who commanded a brigade of cavalry at Höchstädt, died during the disastrous retreat which followed this defeat, at Thionville on the 10th of October, 1704. The poor mother was literally crushed by his death, and she succumbed on the 16th of August, 1705, to an attack of smallpox at Mazargues, near Marseilles. The Comte de Grignan remained alone with Mme. de Simiane, and continued to accomplish all the duties of his post with activity and firmness. He took a very essential part in the defence of Toulon, which was besieged in the year 1707 by the imperial troops, the troops of the Duke of Savoy, and by an English fleet. The allies intended, if they could take Toulon, to land an army which was to join the Protestant rebels of the Cevennes. Villars had been sent against the insurgents. He had contrived to divide the Camisards, and to conclude a sort of treaty with Cavalier, their most important chief. Cavalier had received a brevet of colonel with permission to organize Protestant regiments on the model of other foreign regiments which served in France. He went to Geneva, then passed into Piedmont, and thence crossed to Catalonia, where he fought at the battle of Almansa (April, 1707). He left Spain to take his place in the Austro-Piedmontese army which was on the point of invading Provence, hoping to make his appearance again in the Cevennes and to raise a rebellion.

M. de Grignan, as we have said, showed much prudence and activity in the preparations which he made against the invaders: he opened the eyes of his Government to the peril of Toulon, he visited the place, organized the militia, and, at the end of the campaign, had the satisfaction of seeing the Duke of Savoy obliged to raise the siege and to leave with his army for Piedmont. He remained, so to speak, in the saddle to the end, travelling constantly from Marseilles to Grignan, from Grignan to Aix or to Lambesc, which was the seat of the Assembly that took the place in Provence of the former States. It was at Lambesc that he died suddenly, in an inn, on the night of December 30–31, 1714. He was eighty-five years old, and had governed Provence for forty-five years. He left the highest reputation for integrity, vigilance, and moderation. His daughter, Mme. de Simiane, found the affairs of her father in the greatest confusion, and made it the object of her life to pay his debts. Her husband, the Marquis de Simiane, first gentleman of the Duke of Orleans, was appointed Lieutenant-General of the King in Provence, in place of his father-in-law. The Simianes left Paris and the Court, where they were much liked, and settled completely in Provence.

One of the most interesting parts of M. de Saporta's book is the history of the relations between Mme. de Simiane and the Chevalier Perrin, who became the editors of the letters of Mme. de Sévigné. The first edition appeared at Troyes in 1725. It is very rare, and I have never seen it. Some of Mme. de Sévigné's letters had appeared already in the Memoirs of Roger de Rabutin, Comte de Bussy, her cousin (Paris, 1696), and in the collection of his letters, which appeared in the same year, and in 1709; but these were merely the letters addressed to Bussy. Mme. de Simiane had copies made of many of her mother's letters to Bussy and to his son, the abbé, who afterwards became bishop; and these copies reached through several hands the Troyes editor and the editors of the more complete editions which appeared in 1726. There are several of these, one with a preface by Bussy, Bishop of Luçon, and notes by Thiriot, without any indication of place; another appeared at The Hague in 1796; another at Rouen. An edition was printed in 1728, almost identical with the edition of Rouen of 1726; but the editions of 1726 have two volumes, the edition of 1728 has a third volume. All these details are amply given in Hachette's fine edition of Mme. de Sévigné.

What interests us is to know that all these editions were the result of indiscretions, and made Mme. de Simiane very unhappy, as allusions were often made to people who were still alive, or who were the friends of the Grignans. Mme. de Simiane tried in vain to have the editions of 1726 suppressed; as she found it impossible, she thought it best to have an edition of her mother's letters made under the supervision of a friend. The Chevalier de Perrin offered his services. Who was he? The son of Louis Perrin, a merchant who had ennobled himself by buying an office of secretary of the King. Denis Marius Perrin was one of nineteen children; he was called the Chevalier, as he had obtained the cross of St. Louis in the army. He was a literary man and a man of the world. He was fifty years old when he began the edition which has preserved his name, and which has for a long time been the classical edition of Mme. de Sévigné (four volumes, published in 1734). We know now that the Chevalier softened, suppressed, and altered some passages of the letters. We know also too well that Mme. de Simiane, who lived in Provence, destroyed almost all the letters of Mme. de Grignan to her mother, and we can only guess at their contents by the answers to them. Mme. de Grignan had a sarcastic turn of mind, and if her letters had been published, the good people of Provence would probably have taken much offence at many of her remarks. Mme. de Simiane had so many scruples that she destroyed also the originals of the letters of her grandmother, and as the Perrin publication drew to an end, she became more alarmed, till finally she tried to stop the publication. Perrin resisted, and said it was too late. Perrin formally disobeyed the orders of Mme. de Simiane when in 1737 he added two volumes to the four volumes published in 1735. His disobedience caused her much annoyance, and was the beginning of a long quarrel, the details of which are minutely related by M. de Saporta.

I have not said much of Mme. de Simiane herself—she is well known. She had resigned herself to her provincial life, had left the Château de Grignan, and was finally obliged to sell it. She lived in the neighborhood at the Château de la Garde, near Grignan, inherited from an uncle. She had three daughters: one, the eldest, entered a convent; the second married in 1723 the Marquis de Vence; the third was married in 1725 to Jean-Baptiste de Castellane Marquis of Esparron. The Vences and the Castellanes were among the first families of Provence. Afterwards, Mme. de Simiane resided at Aix, where she bought a house, which still exists, and where her apartments may be seen. She took much pleasure in adorning it, and employed for the painting of some panels Joseph Vernet, who was then unknown. She did not enjoy long her new home, and died at the age of sixty-three years.

The Chevalier de Perrin could now do as he pleased with Mme. de Sévigné's letters. M. de Saporta gives some details on the end of this personage. He went to Paris, surrounded by the halo of Mme. de Sévigné's letters. He became a sort of diner-out, was attached as secretary to the Marshal of Belle-Isle, and accompanied him to Provence during the invasion of the Austrians, which was a sort of repetition of the invasion of 1707, and which resulted as disastrously for the allied forces. Perrin ended his days happily, in the brilliant society of Paris, and died of indigestion at the age of seventy on the 7th of February, 1754.

SHOULD CREDIT BE PAID FOR?

To the Editor of The Nation:

Sir: Judge Brewer, in his recent decision refusing an injunction to certain railway companies against the Railway Commissioners of the State of Iowa (on the ground, substantially, that the new schedule of rates established by the Commissioners has not yet been shown to be unreasonable), quotes as applicable to the case the language used by Mr. Justice Woods in another case, where railroad commissioners had asserted "that their schedule was framed to produce 8 per cent. income on the value of the road, after paying cost of maintenance and running expenses."

Assuming, therefore, for the purpose of argument only, that 8 per cent. is a reasonable return upon railroad property, it follows that for a railway system in the State of Iowa which would to-day cost one hundred million dollars, the owners ought to be allowed to re-

ceive, if they could command the skill to earn it, the sum of eight million dollars annually, or dividends of eight dollars a share on a million shares of one hundred dollars each. But suppose that these stockholders, being willing to increase their risk for the chance of greater gain, mortgage their whole railway system to more timid capitalists than themselves for fifty million dollars at 4 per cent., and use the money to pay back one-half of their own capital stock. They could now in prosperous years make annual dividends of 10 per cent. on their remaining half million of shares, thus gaining for themselves, by the use of their own credit, a million dollars a year, while saving another million to the people of Iowa. Ought the people of Iowa to object to the second method of providing capital because it gives the stockholders too large a dividend? Can they reasonably expect stockholders, without hope of profit, to assume great risks for their benefit?

That the risks taken by railway stockholders whose property is mortgaged are very serious, is a fact now apparent to everybody. Many poor New England people, and a few rich ones, who subscribed less than two years ago for new shares of the Atchison, Topeka and Santa Fé railroad at par, in the hope of assured dividends, are having to day a bitter experience of the burden of fixed charges, which now leave no income for their shares, and have already, so far as they are concerned, swept away a large part of the capital they so lately paid in.

E. W. H.

Cambridge, Mass., March 12, 1889.

OUR HISTORICAL TARIFF.

To the Editor of The Nation:

Sir: I think the historical recurrence to the origin of our tariff legislation by the President in his inaugural address, in order to justify our present tariff, is rather an unfortunate one.

"Commercial emancipation," says the address, "had to be added to the political freedom so bravely won. The commercial policy of the mother country had not relaxed any of its hard and oppressive features. To hold in check the development of our commercial marine, to prevent or retard the establishment and growth of manufactures in the States, and so to secure the American market for their shops, and the carrying trade for their ships, was the policy of European statesmen, and was pursued with the most selfish vigor. Petitions poured in upon Congress urging the imposition of discriminating duties that should encourage the production of needed things at home. The patriotism of the people, which no longer found a field of exercise in war, was energetically directed to the duty of equipping the young Republic for the defence of its independence by making its people self-dependent. Societies for the promotion of home manufactures and for encouraging the use of domestics in the dress of the people were organized in many of the States. The revival at the end of the century of the same patriotic interest in the preservation and development of domestic industries, and the defence of our working people against injurious foreign competition, is an incident worthy of attention. *It is not a departure, but a return, that we have witnessed.*"

Now, it seems to be very clear, from the President's own statements at the beginning of this passage, that the tariff law enacted July 4, 1789 (which, it may be remarked in passing, levied an average duty equivalent to an ad valorem of 8½ per cent. only), was passed to counteract *the hard and oppressive features of the policy of the mother country.* Now for more than forty years these measures, so injurious to us, have all been repealed or greatly modified. Duties are levied on but few articles, and we have an open market for all our breadstuffs, cotton, and nearly everything else we produce or manufacture. England has not obstructed our carrying trade, which is kept down by no country but our own, by absurd legislation.

It is an old maxim in the law that when the reason for a law ceases, the law itself ceases. If the President had argued as a lawyer, he would have had to state that, the mother country having ceased to oppress us, our tariff ought consequently to be modified accordingly. Instead of that we meet with the assertion: *Our tariff is not a departure, but a return (to the policy of 1789) that we have witnessed.*

G. K.

Belleville, Ill., March 14, 1889.

A GREEK EXAMPLE.

To the Editor of The Nation:

Sir: No one that has any interest in the affairs of contemporary Greece needs to be told that return to specie payments, and not the disposal of an accumulating surplus, is the engrossing problem of its national finance to-day. In view of this, the liberality of most of its recent legislation bearing on trade, ship-owning under the Greek flag, manufactures, etc., is remarkable. Indeed, its results are already so gratifying that we may well stop to consider whether the commercial intelligence of the Greeks is not proving itself very much more alert than our own.

A fresh illustration of its working is under my eye in a report, given by the Athens Ακρόπολις for January 26, of a tariff debate in the Greek Assembly during its session of the day before. Mr. Tricoupis, the Prime Minister, spoke at length in defence of a projected reduction in the duties on lumber. He observed: "It is in the interest of Greece that raw lumber should be imported, in order that the cutting down of our forests may be in a measure checked; as now conducted by us it results in their destruction. Therefore there is need of a reduction of from 35 to 38 per cent. in the duty, which is the more imperative if the loss of material by sawing and squaring is taken into account." After this and one other explanation from the Prime Minister, the tariff-revision bill was passed at its third reading.

Yours sincerely, Alfred Emerson.

Lake Forest University, March 11, 1889.

A SPUR TO LEGISLATION.

To the Editor of The Nation:

Sir: Public interest in the electoral-reform measure known as the Saxton bill does not make itself felt as much as it should do in order to convince our legislators that it is really desired by the people. There is no doubt that an immense majority desires its enactment, but it is so difficult to get an expression of this wish that the politicians conclude that it is not really desired, while the legislators having the people's interest at heart are discouraged because they find so little popular support. If this popular desire could be focussed upon our legislators at Albany from all parts of the State, I am confident that they would respect it, and grant the people's wish.

A very simple and effective way to accomplish this result, and one to which anybody can "lend a hand," was brought to my attention only the other day. Four gentlemen of different political views, but who heartily desire the enactment of the Saxton bill, formed a little club, and pledged themselves to speak to every one of their acquaintance regarding it. They subscribed an insignificant sum, and purchased postal cards, and one of their number printed them with the following blank form on the hektograph:

New York,.....1889.

Hon.....
Assembly Chamber.

Dear Sir:

I am heartily in favor of the electoral-reform measure known as the Saxton bill, and trust that you will use your influence to secure its enactment.

Respectfully,
(Name of signer) .....
(Residence of same) .....

If the man spoken to was in favor of the reform, he was to be asked to fill out a card and forward it to the Assemblyman from his district.

This is a very simple and practicable method for exerting a powerful influence for good, and I am informed that these gentlemen are very much encouraged by their success in securing signatures. Will not others try it, and "lend a hand" to this good work?

Respectfully, Wm. S. M. Silber.

New York, 2111 Fifth Ave., March 18, 1889.

THE POWER OF STATE LEGISLATURES.

To the Editor of The Nation:

Sir: The evident care with which Professor Bryce prepared his great work upon the 'American Commonwealth' has not precluded an error which, in my opinion, is a very serious one. In discussing the powers of the various departments of our State governments, he declares that the Legislature of a State is as potent as the Parliament of Great Britain, and may enact any law whatsoever, however unjust or iniquitous, provided such law is not expressly prohibited by the Constitution of the State or United States, or does not involve an assumption of the authority delegated to the coördinate departments of government.

I am aware that very eminent judges have asserted and sanctioned this doctrine, but I believe it to be repugnant to the spirit of our institutions, and contrary to the prevailing opinions and judgments of the great jurists of the country.

"I cannot subscribe to the omnipotence of a State Legislature, or to the doctrine that it is absolute and without control, although its authority should not be expressly restrained by the Constitution or fundamental law. . . . There are certain vital principles in our free governments which will overrule a flagrant abuse of legislative power, as to authorize manifest injustice by positive law, or take away that security for personal liberty or private property for the protection whereof the government was established" (Chief-Justice Jay, 3 Dall., 386).

"It may well be doubted whether the nature of society and government does not prescribe some limits to the legislative power. . . . How far the power of governing may involve every other power, in cases where the Constitution is silent, never has been, and perhaps never can be, definitely stated. The validity of an act [revoking a grant of land] might, then, well be questioned without regard to the Constitution" (C.-J. Marshall, 6 Cranch, 135).

Justice Story invokes the "great and fundamental principles of Republican government," the "common sense of mankind," the "maxims of eternal justice," the "principles of natural justice," the "spirit of the Constitution"; and upon such authority avoids an unjust law in 9 Cranch 43, and 2 Peters, 627. Mr. Webster, of counsel in the last case, based his argument chiefly on the fundamental principles which received the sanction of the Court, and Mr. Wirt, his adversary, did not dare to question their authority.

"The theory of our governments, State and national, is opposed to the deposit of unlimited power anywhere. There are limits on the legislative power which grow out of the essential nature of all free governments, implied reservations of individual rights, without which the social compact could not exist. A government which recognizes no such rights, which holds the lives, liberties, and property of its citizens at all times in the absolute disposition and un-

limited control of even the most democratic depositary of power, is but a despotism" (Justice Miller, 20 Wall, 655).

"That absolute, despotic power which, it is said, must in all governments reside somewhere, and which is exercised by the British Parliament, was, by the people, in the formation of our Government, carefully retained" (1 Aiken, Vt., 121).

"The security of life, liberty, and property lies at the foundation of the social compact. The Legislature has therefore no power to defeat one of the greatest ends for which government was established" (4 Hill N. Y., 143; 4 Barb. N. Y., 64).

"It is not pretended that we have any express constitutional provision upon the subject; nor have we any for numerous other rights dear alike to freedom and justice" (Judge Kent, 7 John N. Y., 489).

"It is conceded that there are certain limitations on the taxing power not prescribed in the express words of the Constitution, but inherent in the subject itself, which are as inflexible and absolute in their restraints as if directly imposed in the most positive form" (Judge Cooley, 20 Mich., 473).

"Natural rights are higher than law" (1 N. H., 199).

"It is fortunate for the rights of the people when a case occurs which causes the courts to pause and retrace the boundaries of delegated power. . . . A law plainly, palpably, rankly, ruinously unjust, is against the Bill of Rights" (Judge Agnew, 82 Pa. St., 365).

"The right of private property is an original, fundamental right existing anterior to the formation of the Government. Independent of constitutional declarations, a law invading a private right, or impairing the obligation of a contract, would be a violation of one of the great primary objects for which governments are instituted, and a usurpation of power" (1 Ohio St., 631).

I engage to furnish a hundred similar cases, wherein limitations have been imposed upon the legislative power which have not been provided by any constitutional declaration. The doctrine underlying them is as old as the Government, and survives to this day in all its original vigor. It was formally declared nearly one hundred years ago (1798), and was the basis upon which counsel for the corporation of the Church of Jesus Christ of Latter-Day Saints founded their recent argument before the Supreme Court of the United States. It involves the principle which controlled the Court in the case of the people of New York vs. O'Brien.—Yours truly,

ISAAC H. LIONBERGER.

ST. LOUIS, March 13, 1889.

Notes.

WE learn that Dr. Woodrow Wilson, whose 'Congressional Government' met with such a favorable reception, will soon have ready for publication a more extensive and serious study of governmental functions, entitled 'The State: Elements of Historical and Practical Politics.' This work has been in hand for several years, and is now finished. It will contain about 550 pages, 12mo.

A 'History of West Virginia,' from 1732 to the present time, has been written by Prof. Virgil A. Lewis of Mason City, Mason County, West Virginia. Only a limited number of copies will be published, and they will be sold by the author. Prof. Lewis has carefully examined all authentic records of the State, the archives at Richmond, and those at county-seats—in all, nearly one hundred. The first part of the book treats of the first permanent settlement in the Shenandoah Valley, and comes down to the Revolutionary War. Part second covers the ground between the Revolution and the Civil War, and part third brings the narrative down to the present time.

Mr. Cabot Lodge's 'George Washington,' in the American Statesmen Series of Houghton, Mifflin & Co., will be ready, in two volumes, before the inauguration festivities next month. The same firm publish directly 'A White Umbrella in Mexico,' by F. Hopkinson Smith, with the author's illustrations; and Prof. A. S. Hardy's 'Passe Rose.'

Charles Scribner's Sons will shortly bring out 'The Pretty Sister of José,' a Spanish story by Mrs. Frances Hodgson Burnett. Scribner & Welford will be the American publishers of a new and enlarged edition of Sir Spenser St. John's 'Hayti; or, the Black Republic'; a new and cheaper edition of F. H. Guillemard's 'Cruise of the Yacht *Marchesa* to Kamtchatka and New Guinea'; 'The Alps,' by Prof. F. Umlauft; and 'Iris,' a volume of essays on colors and flowers by Prof. Delitzsch.

Longmans, Green & Co. have in press a selection from Mr. Andrew Lang's social and literary articles in the London *Daily News*, under the punning title, "Lost Leaders."

'Footprints of Travel; or, Journeyings in Many Lands,' by M. M. Ballou, is announced for immediate publication by Ginn & Co., Boston.

Mr. Thomas S. Townsend awaits the necessary support in preliminary orders for publishing through the Messrs. Putnam a work entitled 'The Honors of the Empire State in the War of the Rebellion,' an octavo volume of about 225 pages. Subscriptions are payable to Mr. Samuel O. Fields, Columbia College Library.

The fourth volume of Prof. Henry Morley's 'English Writers' (Cassell & Co.) is devoted to the fourteenth century, and contains the usual elaborate accounts, each of which is practically a scholastic monograph, of the more prominent authors. Another volume will be necessary to complete the story of the century. The leading topics here are the 'Romaunt of the Rose,' Petrarch and Boccaccio, Miracle Plays, Gower, Maundeville, and Langland. We have already noticed the great value as a convenient reference book of this encyclopædic work, the fruit of a lifetime's learned acquaintance with our literature.

The school and students' editions of Bierbaum's 'English Literature' (B. Westermann & Co.) are at hand, but a teacher must be German-mad to put so dry and barren a compilation of dates, titles, and facts into the hands of the young with any hope of helpful knowledge resulting. Apart from objection to the plan of the work, the matter itself lacks discretion in criticism and lags behind our present knowledge. In details there are several material errors, particularly in biography. It would be interesting to know whence the author derived his quoted criticism, such as the statement that Milton's 'Samson Agonistes' is "neither impassioned nor strong in character, nor poetical in its lyrical parts." He decides that Milton "cannot be considered a true-born poet touched with the heavenly flame." He says that 'Comus' was "founded on an actual occurrence," and the error is of a sort to throw light on his superficial acquaintance with the subject he treats. Under the metaphysical poets he includes Suckling and Lovelace, but does not mention Donne, the greatest of them, for whom we have to look in four or five lines of fine print under Miscellaneous. The American section is capricious, though an effort has been made to have it full, since it includes Mrs. Whitney and Charles Egbert Craddock; but it is indiscriminating. As a whole, the work bears every mark of being a second-hand compilation, in which literary and historical perspective has entirely disappeared.

Dr. C. W. Cutler's 'Essentials of Physics and Chemistry,' written especially for the use of students in medicine (Putnams), is by no means without merit, and certainly contains a great deal which is valuable and which a student of medicine must know. It would be easy to find fault with it, and to point out defects both of definition and of statement. These, however, are seldom misleading. The chemical is better than the physical portion of the work; yet it is disheartening to read the chapter on animal chemistry, which takes up only three pages of a work intended for students of medicine, when we consider what has been done in animal chemistry and what ought now to be required of a well-educated physician. Dr. Cutler's book will doubtless be useful to a certain class of students, but all such compends are wrong in principle, and tend to encourage superficial knowledge.

Mr. J. Scott Keltie's 'Statesman's Year-Book' for 1889 (Macmillan) is prompt in appearing, and requires no introduction to our readers in this its twenty-sixth year. The two heads of our present Administration are named side by side with the outgoing President, but by an odd typographical blunder Mr. Harrison is "elected reporter of the Supreme Court of Morana [Indiana]," and an editorial lapse in the same paragraph bestows on him a political honor not enjoyed—"Governor of Indiana, 1880." In the table of Presidents, Mr. Harrison is assigned in the column "from State" to his birthplace, Ohio; but this introduces an inconsistency into the table, the elder Harrison being also assigned to Ohio, Cleveland to New York, Grant and Lincoln to Illinois, Arthur to New York, etc.—by virtue of residence and not of birth. To the books of reference on this country Mr. Keltie has added Bryce's 'American Commonwealth.'

When Sydney Smith explained the Englishman's reticence as not being because he did not know how to speak, but because he had nothing to say, he illustrated the most serious and permanent difficulty encountered in the literary training of the young. With sufficient pains, almost any child can be taught to write correctly, but his powers of expression will be limited by his natural endowment of brains and capacity for reflection. It would be hard to say whether the teaching of science or of English as a preparation for college presents the more serious problem. The latter has been the chief concern during the past year of that useful body, the Commission of Colleges in New England on Admission Examinations, of which the second annual report (1887-88) is before us, and may be had of the Secretary, Prof. W. C. Poland, 7 Cooke Street, Providence, R. I. The college instructors in English have been brought together in conference and counsel with the heads of preparatory schools, and the result is a more stable list of requirements, of which those for 1889-92 are published in the report. How far the works prescribed to be studied shall be trusted to have had, from simple perusal, their effect on the youth's culture, and how far they must be treated and enforced (and loathed) as text-books, is one of the points in debate. The report deserves wide attention.

We have received the 'First Annual Report of the Board of Trustees, New Jersey Industrial Education, City of Hoboken.' The first movement towards manual training, of which the present Board and system are the outcome, was begun in 1885, with the favor of Gov. McClellan, and received for three years help from both State and city. There are now 1,450 pupils in the public schools profiting by it. The report states the nature of the instruction in the several branches, from plain sewing to mechanical drawing, wood-carving, and clay-

modelling. The result seems to be eminently encouraging.

An exceptionally good piece of work in local church history is that performed for the First Congregational Society of New Bedford, Mass., by its pastor for thirty years, the Rev. William James Potter. "Its History as Illustrative of Ecclesiastical Evolution" is the sub-title of the monograph, and is well justified. The original town of Dartmouth was in Plymouth Colony, and a large majority of the settlers were Quakers and Baptists—sects then having a much closer affinity than nowadays. These successfully resisted the efforts of their own, and afterwards of the Bay, Government to establish a church and a minister, and in the last resort of the authorities to coercion they triumphantly appealed to England. Mr. Potter's researches led him further than he at first intended for a memorial discourse, and he has produced a valuable contribution to Massachusetts history. His style is genial, and free from any trace of either bigotry or dulness.

The February and March numbers of the *Studio* are full and lively as regards the text, and abound in many interesting illustrations, of which we will mention the two copies of Rembrandt portraits loaned by Mr. Henry Havemeyer to the Metropolitan Museum, and Mr. Edward Kemeys's masterly design of the American panther and her cubs. We unite with Mr. Cook in his hope that the endeavor to have this work cast in bronze for the Central Park will succeed. We agree also with the editor's strictures on the refusal of the Trustees of the Metropolitan Museum to open the building on Sundays at the cost of Mr. Walters of Baltimore, in accordance with his generous offer.

Petermann's Mitteilungen for February contains the conclusion of an account, by Dr. C. Diener, of the fourth journey of Gen. Przevalsky in Central Asia, with an admirable map, on which are noted the routes of Carey, Younghusband, and other recent travellers in this region. Dr. O. Baumann, a member of the unfortunate expedition of Meyer in East Africa, describes Usambara, that part of the German possessions lying opposite Zanzibar on the main land, and the principal theatre of the recent hostilities. He concludes that, while it is a beautiful and promising country, to dream of settling it with German colonists is utopian, on account of the climate. Plantations, however, can be cultivated profitably with negro laborers. The great obstacle to the peaceful settlement of the land is the hostility of the Wakilindi, the ruling race of the three which dwell in this region, who are Mohammedans and thoroughly sympathize with the Arabs.

The Euphrates Valley Railway is the subject of a paper by M. A. Dumont in the last *Bulletin* of the Paris Société de Géographie, in which he urgently advocates the route from Constantinople to Alexandretta, and thence by Aleppo and Bagdad to Bassorah on the Persian Gulf. This is followed by an interesting sketch of the island of Réunion, off the coast of Madagascar, by M. Ad. Blondel. The method of the construction of the artificial harbor at the Pointe des Galets is described, as well as the railway which now nearly surrounds the island. The manufacture of sugar, which was formerly the staple industry, is nearly ruined from various causes, the product having fallen off from 60,000 tons in 1867 to 39,000 in 1886, so that it is seriously proposed to abandon the cultivation of the cane for that of tea, tapioca, tobacco, and the geranium, and for the manufacture of rum and perfumes. M. Al. Piat advocates the construction of a naval and commercial port at Cabourg, not far from Havre, the chief feature of which is an internal basin more defensible than Havre or Cherbourg. This proposition has excited some interest in the French Chamber of Deputies and in commercial circles.

Le Fifre, a new satirical weekly paper, made its first appearance in Paris on the 23d of February. It is a handsome sheet of four pages, containing two large drawings by M. J.-L. Forain, the well-known realist-impressionist painter. M. Forain, in fact, will be the paper, since he is its owner and publisher as well as its editor and sole contributor with pen and pencil. It may be expected to be very clever, very keen, very Parisian, and very modern. In his first number M. Forain merely makes his bow to the public, being presented by his friends, M. Richepin and M. Aurélien Scholl.

As was generally expected, M. Berthelot has succeeded M. Pasteur as Perpetual Secretary of the Physical Sciences at the Institute. He received 47 votes out of 55, the others being 3 blank, 2 for M. Milne-Edwards, and 1 each for MM. Daubrée and Bouchard. M. Pasteur has been appointed Perpetual Honorary Secretary by the Academy.

Some obituary praise of the late H. Gagnière for his modesty and love of work rouses the *Revue Critique* to unwonted warmth. It asserts that M. Gagnière was a simple plagiary, who gave as the fruit of his own labor what he found in foreign books of which the French public has generally no knowledge. His book on Mary Caroline, which he asserted was based on unpublished documents preserved in the British Museum, "contains not one unpublished line." It was constructed wholly out of Palumbo's 'Maria Carolina, regina delle due Sicilie, suo carteggio con Lady Emma Hamilton,' and of some letters printed in Nelson's correspondence. In 1888 he published "Les Confessions d'une abbesse du XVIe siècle," with a statement that it was taken from a manuscript in the Ravenna library, when he had never even seen a Ravenna manuscript. The book was simply stolen (as we reported the other day) out of Ricci's 'Cronache e documenti per la storia ravennate del secolo xvi,' Pasolini's 'Memorie storiche della famiglia Rasponi,' and from an article of A. Borgogni's in the *Nuova Antologia*. No acknowledgment of the sources from which these books came was ever made. "C'est ainsi," says the *Revue Critique*, "que M. Gagnière, pour nous servir des expressions de la *Nouvelle Revue*, 'honorait la valeur morale.'"

—For every letter of Washington's that Sparks printed, at least ten are now available, says Mr. Worthington C. Ford, in enumerating the distinctive features of his new edition of the 'Writings of George Washington' (vol. i, 1748-1757. G. P. Putnam's Sons). Moreover, Mr. Sparks neglected all but a very small part of the commander-in-chief's official correspondence during the Revolution. And, finally, it is well known what liberties the Cambridge editor took with the style of his hero, in order to maintain his dignity in the eyes of posterity. Mr. Ford not only has had access to collections hitherto jealously guarded, but is heir to all that has come to light since Sparks's day, and is imbued with the exact historical spirit of our time. His undertaking calls for some fourteen volumes, uniform in size, print, and manufacture with the Hamilton and Franklin series from the Knickerbocker Press, which have been so well received. An examination of the first volume convinces us that Mr. Ford's editing will compare to advantage with that of Mr. Cabot Lodge or Mr. John Bigelow. The subsequent volumes will more fully reveal the difference between himself and Sparks in the matter of restoring the retouched texts by strict copying of the originals. There was less call for sophistication in these early annals of border warfare with the French and Indians. The main pieces are the Journal of a Survey in 1748; the Journal of the expedition to spy out the French forces on the Ohio in 1753; and the Journal of the march to the Ohio in the spring of 1754, involving an attack on the French and the death of their commander Jumonville, followed by the defeat at Great Meadow the last of May—with glimpses rather than a connected narrative of Braddock's ill-fated expedition in 1755. The rest of the volume is occupied with letters relating to the thankless service to which Washington was next assigned as commander-in-chief of the Virginian forces, in defending the frontier against French and Indian invasion. Gov. Dinwiddie's fussiness, want of business methods, not infrequent complaints and censure, and standing dread of a slave rising, with the French for liberators, made the young soldier's life almost intolerable—to say nothing of the troubles he had with deserters from the militia, Quakers who would not assist in the common defence even by unmilitary labor, scanty supplies and poor pay, rascally contractors' goods, the panic state of the population, etc. All this was admirable preparation for what was to be endured as leader of the Continental forces. The volume closes with Gov. Dinwiddie's return to England, with Washington's hearty assent. Mr. Ford's judicious editing is shown in his treatment of the French *précis* of Washington's Journal of the March, here retranslated and intermingled chronologically with Washington's contemporary correspondence. The journey to Boston in 1756 is also well looked after. The proof-reading seems to us more scrupulous than that of the Hamilton and Franklin series; the table of contents is sufficiently analytical. Desirable at the close of the work would be a tabular chronological view of Washington's doings and whereabouts year by year, and even month by month.

—The most noteworthy article in the January number of the *English Historical Review* is by E. Armstrong, upon "The Political Theory of the Huguenots." The author shows that the massacre of St. Bartholomew was the great crisis, not only in the Huguenot wars themselves, but in the literature of the reformers: "The supreme importance of the massacre of St. Bartholomew to the literary history of the wars," we are told, "may be proved by the fact that all the important works of genuine Huguenot parentage are written within seven years of that event." The principal part of the article is taken up with an analysis of the two most famous of these works—the 'Franco-Gallia' of François Hotman and the 'Vindiciæ contra tyrannos,' a book of uncertain authorship, usually attributed to Hubert Languet. It is interesting to note that at this point of time the Huguenots were rather favorably disposed to the House of Guise, and one of Hotman's points was an attack upon the Salic Law, which excluded this house from the throne. It was he who showed that this law properly "only referred to private allodial property. It did not exclude male descendants in the female line." This view completely supports the claim of Edward III. to the English throne, which we have always maintained was not, at that time, so preposterous as modern writers assume. Other articles are "The Growth of the Freedom of the Press," by Douglas M. Ford; "The Roman Emperors, from Basil II. to Isaas Komnênos, Part i," by

John B. Bury, and an entertaining episode of the war of the Spanish Succession—"The Captains of the *Nightingale*," by J. K. Laughton. The Notes and Reviews are many of them of considerable interest; the one of most importance is perhaps "Cromwell and the Insurrection of 1655, Part iii," in which Mr. Reginald Palgrave develops further the thesis of the previous part, "that fraudulent exaggeration of the designs and resources of the Royalists, and the manipulation of plots, were essential features in Cromwell's home policy."

—Of late years the current of opinion among librarians seems to have been running strongly in the direction of closer shelf-classification, and outsiders have been fairly bewildered by the numerous schemes of classification, in which all possible combinations of letters and figures have apparently been exhausted, and even hieroglyphics been pressed into the service, to denote the positions of the books. Doubtless the authors of these schemes have derived no little satisfaction and pleasure from their self-appointed task of mapping out the whole domain of science and literature into microscopic sections, and theoretically these systems are all more or less admirable; but their cumbersome and intricate notation must always be a fruitful source of error in calling for books, while it is not likely that ordinary readers will ever become so familiar with it as to obtain any benefit from the elaborate classification. And, indeed, signs of a coming reaction against the prevailing tendency are beginning to show themselves both here and abroad. Among these may be noted the simultaneous appearance of two articles, by librarians of experience, maintaining that too much importance has been attributed to shelf-classification and that its usefulness has been greatly overrated. One of these articles is by Dr. Kerler, Librarian of Würzburg University, and is to be found in the February number of the *Centralblatt für Bibliothekswesen;* the other is by Mr. Fletcher, Librarian of Amherst College, and is contained in the January-February number of the *Library Journal*. The objections to the current systems are forcibly stated, and it is clearly shown that, even under the best system of classification, it is impossible to secure the chief object of the system—namely, the exhibition in a given place of the resources of the library on a given subject, since in the nature of things only a portion, and that not always the most valuable portion, of the library can be brought together upon the shelves; for, to say nothing of the necessary separation of books of different sizes, no librarian would seriously think of breaking up the numerous sets of periodicals, transactions, etc., which form so large a part of a modern library, in order to distribute under the specific subjects the monographs they contain. Mr. Fletcher rightly lays stress upon the evil tendency of these systems to encourage reliance upon this necessarily imperfect presentation of the resources of the library, to the neglect of the catalogue and of special bibliographies—a neglect which must often prove fatal. These articles foreshadow a return to simpler methods, and certainly, between the extreme of fixed location, with no classification, on the one hand, and that of movable location, with minute classification and its intricate notation, on the other, there is room for a system which, while retaining some of the undoubted advantages of the fixed-location systems, shall have sufficient elasticity for all practical purposes, and at the same time combine a reasonable measure of classification with a simple and self-explanatory method of notation.

—Three recent numbers of the *Week* (*Nedyéla*) contain a chapter from Count Leo Tolstoi's new philosophical work, 'Thoughts about Life.' This extract is entitled "The Fear of Death," and the author tries to show that this fear is without foundation, as nothing either ends or begins with death; for life in its various phases will always continue its unvarying and eternal movement onwards. He says:

"The idea that I am about to die and that my life will end, torments and frightens me, and somehow I am sorry for myself. But what is it to die? Why should I be sorry? What sort of thing am I from the most usual point of view? First of all, flesh—what then? Do I fear about that? Am I sorry for that? Apparently not. My body as a substance will never perish, in no case, not a single particle of it. This part of me being assured, there is nothing to fear for that. Everything will be preserved. But no, one says, I am not sorry for that—I am sorry for myself, Leo Nicolaievitch, or whatever my name may be. But then no one is the same person that he was twenty years ago, and every day he becomes somewhat different—why should I be sorry? No, one says, not sorry for that, but sorry for my individuality, my Me. But then your individuality has not always been the same, but has varied. You were different a year ago, still more different ten years ago, and totally different before that. As far as you can remember you have been always changing; why are you so pleased with your individuality at this particular moment that you are so sorry to lose it. If you had always been the same, it might be intelligible, but there has been nothing but change. You don't remember the beginning of you, and you can't find out; and suddenly you want no end, and that this little temporary individuality which you have at this moment should last for ever. Your whole life has been a passage through a fleshly existence; you have gone on, and even hastened, and suddenly you are sorry for the accomplishment of what you have been unceasingly doing. You are horrified by this great change in your position—the death of the flesh. But the same sort of change took place in you at your birth, and nothing bad happened to you; on the contrary, it turned out so well that you don't want any change. You say, then, that you are only sorry for yourself with your present feelings and thoughts, and your views of the world and your present relations with the world. So, then, you are only frightened at the possibility of losing your relations with the world."

Tolstoi goes on in a fatalistic way to assert that death occurs only when and because the blessings of the man's real life cannot be increased in this world, and not because he has disease of the lungs, or cancer, or happens to be shot. In this same spirit he discusses the question of early death, which sometimes seems so sad; and even brings in his dogma of non-resistance to evil. He says: "If we live, it is not at all because we take care of ourselves, but because the act of living is being accomplished in us, which subordinates to itself all these conditions. We are alive, not because we take care of ourselves, but because we are accomplishing the act of living." Apparently, from this, Tolstoi is fairly on the road to joining the Plymouth Brethren; but the Countess, with her good sense, will probably call in the doctor when their lately born thirteenth child has the croup.

THOMAS HILL GREEN.

Works of Thomas Hill Green, Late Fellow of Balliol College, and Whyte's Professor of Moral Philosophy in the University of Oxford. Edited by R. L. Nettleship, Fellow of Balliol College, Oxford. Vol. III. Miscellanies and Memoir, with a portrait. Longmans, Green & Co.

An accidental interest attaches to this memoir and the miscellaneous matter printed with it on account of the dedication of 'Robert Elsmere' to Prof. Green, and the identification of him with the Prof. Grey of the novel. Had there been no dedication, and no passages in the novel avowedly taken from Prof. Green's 'Witness of God,' those who had any knowledge of Prof. Green's position and work at Oxford, and in particular of his personality, must have identified him with the Professor of Mrs. Ward's delineation. Now, as they read the memoir, those who have read the story will see that Mrs. Ward had Prof. Green very steadily in her mind, and that she has given us a very luminous and faithful representation of his personality. This was very strong and interesting and engaging. Those who are least attracted by his thought will be attracted by the man, the fulness of whose nature was not by any means exhausted by his philosophical opinions. There was nothing of the Langham, Amiel, Obermann tendency in his thought to sickly o'er his hue of resolution. Nor was there anything singular or peculiar in the absence of such tendency. There is a brooding kind of intellect that is inimical to action, but the metaphysicians have not often been afflicted with it. An active disposition and public spirit have been almost invariably concomitant with the metaphysic mind. The more attenuated the thought, it might perhaps be said, the less the infirmity of will. Fichte's resolution of God and nature into shadows of himself did not prevent his being one of the most ardent patriots and politicians of his time. Prof. Green's Neo-Hegelianism was not less attenuated than the idealism of Fichte, and he was not less a man of warmest human sympathies and reformatory zeal.

For those who were interested in Prof. Green on the religious side, the two sermons on "The Witness of God" and "Faith" were the most significant expression of his thought. These were published by themselves a few years ago, and it is from them that the 'Robert Elsmere' quotations are taken. It was a custom with tutors at Balliol to speak to their pupils on the evening before the communion was administered; and though Prof. Green was a layman, he had a prophetic soul, and he could not resist its urgency to speak out and impress, if possible, the young men of his charge. But he only spoke twice—in 1870, when he gave "The Witness of God," and in 1877, when he gave the discourse called "Faith." The undergraduates who listened to these things must have been quite exceptional, or they must have squinted as absurdly as the gypsies when George Borrows read to them the Lord's Prayer in Romany. Each of them turns upon Prof. Green's philosophic doctrine of self-consciousness as "itself and not itself in one." In "The Witness of God" he works out the idea that God is the ideal human self. It sweeps away, as of inferior importance if not non-existent, "A God who made us and knows us as from without, a Christ who at a certain time did certain miraculous acts on our behalf," etc., and substitutes for them "an immanent God, a God present *in* the believing love of him and the brethren, a Christ within us, a continuous resurrection." Wherever he translates his thought into vernacular speech, or wherever we are able to do this for ourselves, we find it in its general bearings helpful and inspiring. But it has particular bearings in these sermons. Preached before communion, they endeavor to adjust the use of this office and the ritual of the Church in general to a Christianity without miracle and indifferent to the historical Jesus. The Prof. Green of these passages is the Prof. Grey of 'Robert Elsmere,' who distinguishes between the ability of the clergyman and the layman to use forms of worship which do not agree with his conception of historical truth.

The following sentences will show the drift:

"The Christian ordinances are at hand for our rejection, and if we are wise we shall not neglect them. We cannot afford to individualize ourselves even in respect to outward symbols. We do wrong to ourselves and them if we allow any intellectual vexation at the mode in which they may be presented to us to prevent us from their due use." . . . "Inability to adopt the creeds of Christendom in their natural sense—and in any other sense they are best left alone—need not disqualify us from using its prayers. . . . In prayer we need not ask whether our words as such would be understood by others in the same sense as by us, or whether they convey a correct theological conception. They are not meant to be heard by men. . . . The fact that others who use them have beliefs as to historical occurrences which we do not share, need not prevent us from sharing with them what is not the expression of an historical belief but of a spiritual aspiration." . . . Some "persons are much too ready to acquiesce in isolation as a necessary result of their opinions. . . . The days of tests and declarations, except for clerical functions, are over, and it is surely a weakness, when we are not pressed for our opinions, to make so much of them to other people or to ourselves as to be excluded or to exclude ourselves from joining in a common activity, the spirit of which we inwardly reverence and would gladly make our own, while in separation we are almost certain to lose it."

This is not the kind of teaching that is calculated to make Robert Elsmeres in the churches. If the layman can use forms and prayers which are intellectually false or obsolete to him, the clergyman will think it a great pity if he cannot do as much, and he will find some way of worming himself into a conclusion favorable to his right. Moreover, such a method as that advocated by Prof. Green assumes either that the clergy will be much more ignorant than the laity of the results of critical inquiry, or that they will do what he does not allow—use creeds and forms which have for them no longer intellectual truth. This, or no administration of religion.

In another particular the teachings of Prof. Green were little calculated to make Robert Elsmeres. To reconceive the historical human Jesus was the animating motive of Robert Elsmere's "New Brotherhood." But to the historical human Jesus Prof. Green is quite indifferent. The first three Gospels, in which, if anywhere, we have the material for such a reconception, are that part of the New Testament to which he is most indifferent. Paul's Epistles and the Fourth Gospel, where Jesus is already much idealized, are the parts for which he cares, and in them for what is vaguest and on this account lends itself most readily to further adumbration. Prof. Green deals somewhat sharply with the imposition of theological conceptions on the New Testament in the past, but it may be doubted whether his own exegesis has as much of critical warrant as that of the theologians whom he regards as misinterpreters of Christianity.

The miscellanies in this bulky volume—clxi and 476 pp.—other than the two sermons, which will engage the widest interest, are of extremely various character and importance. They range in date all the way from his first post-graduate years to the last years of his life. His Hegelianism is already clearly manifest in two of the earliest papers, on "The Force of Circumstances" and "The Influence of Civilization upon Genius." The paper that brought him a Chancellor's prize in 1862, when he was twenty-six, was on "The Value and Influence of Works of Fiction in Modern Times," a subject with which he had little sympathy. His treatment of it has now something of additional interest in view of the wider currency which a work of fiction has given to his name and fame. His relations to the Neo-Kantian and Neo-Hegelian philosophy in Great Britain are brought out most clearly in his reviews of Edward Caird's 'Philosophy of Kant' and J. Watson's 'Kant and his English Critics.' Watson's judgment is for him the fairer of the two as being less strenuous to make Kant consistent with himself. A more interesting paper than either of these is his review of Dr. John Caird's 'Introduction to the Philosophy of Religion.' His difference with Dr. Caird comes to this, "that in his method, though not in his conclusions, he has been too much overpowered by Hegel." He suspects that all along Hegel's method has made men hesitate in accepting his conclusions. What he cares for most in Hegel is nowhere more succinctly stated than in this paper:

"That there is one spiritual self-conscious being, of which all that is real is the activity or expression; that we are related to this spiritual being, not merely as parts of the world which is its expression, but as partakers in some inchoate measure of the self-consciousness through which it at once constitutes and distinguishes itself from the world; that this participation is the source of morality and religion—this we take to be the vital truth which Hegel had to teach."

The other miscellanies in the volume consist of certain exegetical lectures, of a fragmentary character, on Romans, Galatians, and the Fourth Gospel; a course of four lectures on the English Commonwealth, sympathetic in the main, finding in English dissent the great spring of the best political life of England from that time to this; and three or four lectures or articles upon various aspects of public instruction in its secondary and lowest grades—a matter to which he gave close attention.

But the account of the man in this volume will be of greater interest to the majority of those who read it than the writings which we have imperfectly described. That, however, will be found to be taken up very largely with summaries and criticisms of the papers published with it. It is evident that it was the personality of Prof. Green which attracted men to him, rather than his special philosophical opinions. It is little likely that these will ever have any depth of root in English soil. They are too exotic in their character to flourish vigorously for any length of time. Prof. Green has now been six years dead, and already Prof. Andrew Seth, the rising hope of neo-Hegelianism in Great Britain, the man on whom the mantle of Prof. Green had, it was thought, preëminently fallen, in certain lectures on "Hegelianism and Personality," which were reviewed in the *Nation* a few months ago, has recalcitrated the neo-Hegelian movement in an almost violent manner, insisting that its doctrines are destructive of both divine and human personality. As Prof. Green insists that the results of Hegel, and not his method, are our best inheritance from him, so it will be his own results, the religious contents of his philosophy, that will long outlast the dialectic by which he endeavored to establish them. So strong was his conviction that the whole world of human experience is the self-communication or revelation of an eternal and absolute being, and that self-sacrifice is the divinely appointed method of becoming one with God, that earnest spirits could not come within reach of his personal influence without being swept away in the flood of his enthusiastic faith and love.

Thomas Hill Green was born in a Yorkshire rectory, April 7, 1836, and died at Oxford March 26, 1882. The father is described by the son as having been prevented from making the best of himself by "a union of magnanimity, indolence, and bad digestion." The magnanimity descended to the son, and also the indolence, over which he triumphed measurably as time went on. At Rugby he did himself little credit, and the same is true of his first years at Balliol, Oxford, where he entered in 1855. He obtained a Balliol fellowship in 1860, but even after this only the influence of Jowett and Conington kept him from sinking into permanent lethargy. The first serious work that he attempted was a translation of F. C. Baur's 'Geschichte der christlichen Kirche.' This he never completed, but Baur's *tendency* method and its results remained with him. An edition of Aristotle was another unfulfilled desire, but the attempt brought him into connection with Edward Caird, and led to a criticism of Aristotle that is one of his most important works. In 1864 he competed unsuccessfully for the chair of moral philosophy in St. Andrew's University.

The man's practical energy came out in his sympathy with the North during our Civil War. He made speeches right and left; he assisted largely in raising $2,000 at Balliol for the Lancashire sufferers. In English politics he was an ardent Liberal, with a peculiar admiration for John Bright. In 1864 he was one of the Royal Commission for the examination of those schools not comprised within the commissions of 1858 and 1861, and his own views were to a great extent those adopted by the Commission in 1868. His strong middle-class sympathies found expression here, as well as in his Edinburgh lectures on the English Commonwealth. In 1871 he married a sister of John Addington Symonds, the brilliant critic of the Italian Renaissance. In 1874–5 a new edition of Hume's works contained a series of Prof. Green's introductions, which are among the most important of his philosophic works. In 1878 he obtained the Whyte's professorship of moral philosophy, a position wholly to his mind. His 'Prolegomena to Ethics' was the outcome of his lectureship. It was not quite completed when he was taken ill, March 15, 1882, and he died on the 26th of the same month. The impression that he made on those who came into sympathetic relations with him was very strong. He was an earnest worker in the fields of education, temperance, and political reform. One gets a very high opinion of the man from Mr. Nettleship's memoir, and the analyses of his philosophical positions are as clear as their abstruseness will allow. The etched portrait suggests the man of vigorous action more than the recondite philosopher. The absence of an index to the biography is a very great defect.

EUROPE IN THE FIFTIES.

Aus meinem Leben und aus meiner Zeit. Von Ernst II., Herzog von Sachsen-Coburg-Gotha. Zweiter Band. Berlin: Wilhelm Hertz. 1888. 8vo, pp. 543.

THE second volume of the memoirs of the Duke of Coburg extends from 1850 to 1860, thus including two such important episodes as the Crimean war and the Italian war of 1859, and treating of the rapid rise of Napoleon III. from a position of ridiculed obscurity to that of the arbiter of Europe. Its interest is more historical and less personal than that of the first volume, and considerable portions of it, dealing in detail with the fluctuations of public sentiment in Germany, appeal but feebly to non-German readers. It opens with a very full account of the Dresden conference of German governments, held from December 23, 1850, to May 15, 1851, with a view to settling the German Constitution on a generally satisfactory basis, but resulting in nothing more encouraging than a return to the old confederacy

of 1815. From the start the old preponderance of Austria made itself felt in carrying out what, in our political dialect, is known as "the slate"; in other words, in constituting the permanent committees in such a way as to have everything cut and dried beforehand in the interest of Austria. In a letter written January 18, 1851, Prince Albert, who had a gift of forcible expression, described the European situation in the following words: "The Emperor Nicholas is for the moment complete master of Europe, Austria only a tool, Prussia a dupe, France a cipher, England worse than nothing, led in its foreign affairs by an immoral statesman [Palmerston]." In March, 1852, he says:

"Austria wishes to become a state, for which she needs time, and demands that Europe shall stand still until Austria shall have become a state. If Europe is satisfied, Austria is quite right to make the demand. . . . But Austria overestimates her strength if she thinks she can continue, in her own interests, to dictate to Europe. To place her for the moment in the position even to attempt such a thing required the well-known weakness of the King of Prussia and the enormous blunders of Lord Palmerston."

The Austrian view of Germany was expressed by Prince Schwarzenberg, who, when the Duke of Coburg remarked to him that the wants of Germany and the weight of its demands did not seem to be recognized in Vienna, replied, "Let us not speak of Germany: it does not exist. As a soldier and a diplomat I have always been abroad, and have constantly found that nobody knows it."

The reassembling of the Frankfort Parliament was the starting-point in the diplomatic career of Bismarck, who had made his appearance in May, 1851, as first Secretary of the Prussian Legation, and in 1852 succeeded General von Rochow as Prussian representative in the Diet. The drastic manner in which he asserted the Prussian dignity against the hitherto undisputed pretensions of Austria, is well known from the descriptions given by Busch and other biographers. It will suffice to cite here the high praise accorded by the Duke of Coburg, often politically opposed to Bismarck, to his official reports from Frankfort. He calls the four stately volumes in which these reports have been printed a genuine national treasure, and says that "their wealth of contents may justly be regarded as the high political school of our times, for hardly in any other nation does there exist anything in the way of diplomatic correspondence to compare with the reports flowing from the never-resting, intellectual pen of the Prussian envoy in Frankfort. . . . I confess that I have often felt that my own opinions and actions might have been modified if I had been as familiar with his point of view and his reasons as I am now."

Outside of Germany a most important event at this time was the elevation of Louis Napoleon to the throne of France. Almost from the date of his election to the Presidency, his course had been a conservative one, calculated to conciliate the rulers of Europe, and to disabuse them of their prejudices and of the alarm with which they had witnessed his successful appearance upon the political scene. He was particularly desirous of cultivating friendly relations with the English court, and the rebuffs with which his first overtures were received in that quarter, so far from discouraging him, only served to increase his assiduities. As a means of ingratiating himself, he warmly seconded Prince Albert's pet project, the London Exhibition of 1851, which had a powerful influence in breeding a more friendly feeling between France and England as nations, without adding much cordiality to the relations between their rulers. The *Coup d'État* only tended to confirm the aversion which Queen Victoria and Prince Albert entertained for Napoleon, for both of them condemned the act from a moral point of view, while such governments as Austria and Prussia hailed it as a death-blow to revolutionism, and Palmerston (actuated, however, by different considerations) also welcomed it, but paid the penalty of his rashness by his dismissal from the Foreign Office.

The Duke of Coburg believes that the war panic which broke out in England in 1852 was without reason, and that at the very time when all Europe was crediting Napoleon with all manner of warlike schemes, the French ruler, feeling the insecurity of his position, was anxiously watching for a sign of good-will from her English Majesty. It is difficult to form any decided opinions as to the real intentions of a man who was on principle and habitually untruthful; it is a fact that he attacked every leading Power of Europe except England; and in the diary of the Emperor Frederick there is an entry under date of March 8, 1871, to the effect that Napoleon was seeking a modification of the conditions of peace under promise of a joint war with Germany against England. A similar indication of his secret feelings towards that country is found in a conversation which he held in March, 1860, with the Comte de Falloux, when he said, "England never is a true ally; she is ever an enemy; she spoils everything she touches." There was good ground for the opinion expressed by King Leopold in a letter to Prince Metternich in February, 1852, that the idea which had ruined Napoleon I., viz., that he could not possibly rule the French without foreign complications and wars, would possess even greater force for his nephew, who had much greater internal difficulties to contend with, and that the only way to hold him in check was to keep Europe united —in other words, to revive the Holy Alliance.

Still, it was characteristic of Napoleon III. throughout his career, that he sought alliances on every side. The Duke relates that only a few weeks before the Emperor announced his intended marriage with Eugenia Montijo, he had applied for the hands of two German princesses, and on being refused in both quarters had declared that he would never again seek a connection with any of the old families, which were incorrigible in their prejudices.

Napoleon's first opportunity was offered him by the Emperor Nicholas. Although war between Turkey and Russia was seen to be inevitable after the Russian manifesto of November 1, 1853, in which Nicholas maintained that he was forced to take up arms in order to demand satisfaction for the insults put by the Sultan upon the holy Russian Church, the French Emperor, uneasy at the lack of war feeling among his subjects, sent an autographic letter to the Czar (on January 27, 1854), breathing the most peaceful sentiments, to which the latter replied with a most unfortunate assurance that the French would find Russia to be as patriotic then as they had found her at Moscow in 1812. Nothing more was required to inflame the French people to a proper degree of ardor.

In the meantime, Napoleon, pursuing his plan of conciliating the good-will of the reigning families, had sent a son of ex-King Jerome on a visit to the King of Belgium, who, having every reason in the world for being on good terms with a powerful and dangerous neighbor, had received the young man with a cordiality so much at variance with what was then the prevailing disposition towards the French court as to excite a good deal of comment. The Emperor made the most of this incident, the friendship of the house of Coburg having especial importance for him at home on account of its connection with the house of Orleans, and abroad through its relationship with the English royal family. The Duke of Coburg, thinking it advisable to cultivate such amicable feelings, offered to his uncle to go to Paris to return the visit in case the latter did not wish to send one of his sons, and the offer was gladly accepted.

The Duke's visit was the first appearance of a reigning sovereign during the new empire, and was regarded as a most important occasion. The Duke at once entered on intimate relations with the Emperor, and prints the notes which he took at the time of their conversations. A great portion of them was concerned with the probable attitude of Prussia and Austria, which would have great influence in the course of the impending war with Russia. The Emperor was profuse in declarations that his policy was far different from that of his uncle; the latter, he said, had been too much intent on interfering with the governments of other States and on suppressing them, but that in the present enhanced national consciousness of the various peoples, it would be folly on his part to follow in his uncle's footsteps. In regard to securing the aid of Prussia against Russia, he said, in German, "I presume the Prussians do not imagine that they are to go into this war for nothing and to derive no territorial advantage from it. But what are really Prussia's wishes? Hanover? Saxony?" (This reminds one how the first Napoleon bought the neutrality of Prussia in 1805 by the cession of Hanover.) To the Emperor's question the Duke replied, that the disinterested policy of Prussia would never permit her to cherish definite wishes of this kind, but that it would be only according to common sense if at some future time she should contemplate a union of her eastern with her western territory. The dignity of the interlocutors forbids the supposition that at this stage of the conversation they exchanged a wink: it is more probable that they maintained a gravity equal to that of the Roman Augurs. The Duke adds, "We agreed upon the one point, that at the outset it was impossible to move Prussia to an alliance by promises." The Emperor was much surprised to learn to what dangers Prussia would be exposed on her left flank from Denmark and Sweden if she undertook to move against Russia. In regard to Austria he said, very impressively, "If it depended upon me, Austria should be welcome to the Danubian principalities; and if I were Emperor of Austria, I should cling less tenaciously to Lombardy, which always remains a gaping wound, is always insecure, demands constant sacrifices, while sooner or later a general rising in Italy is bound to come." He then dwelt in general on the idea that, after a favorable result of the war with Russia, a general European peace congress would be absolutely necessary in order to a final solution of all the questions incompletely decided by the Vienna Congress, and in order to give the nations a lasting peace.

There is no room to give more of these conversations here, but it may be well to mention that it was expected and intended that they should be reported in Berlin and in Vienna, and serve to secure the coöperation of Austria and Prussia. This expectation was not entirely disappointed, for the Duke took pains to communicate what he had learned, and exercised all his influence to weaken Russia, whose preponderance in German affairs he regarded as an obstacle and a menace.

Concerning Napoleon's personality the Duke has some interesting remarks:

"He was quite an uncommon man, and contrasted in every respect with his surroundings and with everything that could be called specifically French. When he sat in his armchair gossiping genially, smoking one cigarette after another, speaking almost dreamily, one imagined one saw a German professor rather than the ruler of France. At such times he could recite whole poems of Schiller and Goethe, and took pleasure in suddenly jumping from French into German conversation."

As the Duke of Coburg was the first sovereign who had bearded Napoleon in his den, and had drawn from him a sort of avowal of his programme and intentions, his reports concerning the man and his opinions were received with interest at the other European courts, and, as already remarked, had some influence in moulding the course of Austria and Prussia, and in bringing about a more cordial personal feeling on the part of Prince Albert. From this time on, the Duke was almost continually flitting back and forth from Paris to Vienna and Berlin, and he describes with great detail the fluctuations and vacillations of policy of all the European Powers, and especially of Austria and Prussia, before and during the Crimean war, and again at the time of the Italian war of 1859. His own little State did not suffice to absorb his energies, aside from the circumstance that he had granted it a constitutional government, and that, consequently, the real work of governing was done by his ministers. The one point which he took in hand personally was a scheme for uniting in a single State his two duchies of Coburg and Gotha. The difficulties which he encountered in carrying it out, and which it required years to overcome, throw a good deal of light on the organic obstacles to a union of Germany. Perhaps it was partly in recognition of the Duke's fitness to shine on a larger stage, and partly from a feeling that the Coburgs were predestined to kingly station, that projects were broached from time to time to offer him the crown of Greece or of Poland; moreover, it was intended, in case Prussia and Austria had jointly allied themselves with France and England in 1854, that he should command an army corps, and in 1859, if Prussia had taken the field against France, he would have had an important command.

While cherishing a military ambition, the Duke also cultivated the arts of peace, and, in addition to dabbling in literature, his competency for which is amply demonstrated by the excellent style of his memoirs, scored some successes as a musical composer. His opera of "Santa Chiara" was produced in Paris in September, 1855, and attained to sixty representations. His rank did not absolve him from the preliminary negotiations, and, in company with Meyerbeer, he visited the principal artists to secure their coöperation. For the wedding of his brother-in-law, the Prince-Regent of Baden, with the Princess Louise of Prussia, he composed a march which, together with one by Meyerbeer, was chosen from among a number of competing compositions. His dominions were a refuge for literary men who had incurred the displeasure of other German governments, and whom he shielded from imprisonment and perhaps graver penalties. The most eminent writer whom he thus befriended was Gustav Freytag, the novelist, whose works are widely known even to the English-reading world.

Freytag, Max Duncker, the historian, Friedrich Gerstäcker, and other lesser lights of literature and journalism, were members of a patriotic literary association established by the Duke in 1853 for the purpose of creating a new national party that should stand midway between the reactionists and the revolutionists, and, if possible, neutralize them both. One of the means of accomplishing this object was to be the influencing of public opinion through the public press, and a project was even entertained for establishing a liberal daily paper; but this was abandoned for lack of the necessary funds. The Duke prints a letter from Lord Clarendon offering to raise £12,000 in England to aid the enterprise, and adds that the negotiations were dropped because a large number of the members of the association did not feel comfortable at the thought of accepting an English subvention. In the absence of a regular journal, the literary activity of the club found vent in pamphlets, but, more particularly, in a lithographed correspondence which was issued from Leipzig to a number of newspapers, and speedily became a power in Germany. It was because Freytag wrote some of the articles in this correspondence that an order for his arrest was issued by the Prussian police. He applied for protection to the Duke, and requested to be appointed to a small nominal office which would make him a citizen of Gotha, and thus enable him to travel outside the duchy without being molested. As he intended going to Leipzig, and there was some danger of his being extradited if the Prussian Government demanded it, the Duke resolved to write on the subject to King John of Saxony (the translator of Dante); but, on the advice of his minister, addressed his letter to the Saxon minister, Von Beust, afterwards famous as the reconstructor of Austria, and received a reply to the effect that Freytag would be safe in Leipzig.

As characterizing the peculiar condition of things in Germany at that time (September, 1854), and the constraint under which public men often exercise their functions, it may be mentioned that, in a postscript to this very reply, Von Beust requested the Duke to obtain a professorship at Jena for Professor Biederman, who, for a violation of the press laws, had been sentenced, in Saxony, to imprisonment for two years. "Although," says Beust, "he has, as a political opponent, attacked me violently, I should like to see him in an independent position, where his great talents would find a new sphere of activity." This same professor was also an active member of the Duke's association. At the request of Freytag, the Duke also interceded with the Austrian Government in behalf of the poet Moritz Hartmann, who had been since 1848 a refugee in London and Paris, and had been captured by the Austrians at Bucharest, while attached to the army of Omar Pasha as newspaper correspondent. The Duke relates an anecdote concerning another liberal writer, Gustav Diezel, whom he invited to Coburg. At a public ball the burgomaster of Coburg accosted the Duke in great alarm, and informed him that one of the most dangerous democrats had just arrived there, which might lead to serious consequences. The Duke replied that if the man was wanted, there would be no trouble in apprehending him, as he was living at the Duke's palace.

There are a score of other interesting topics touched upon in this book, which ought to be made accessible to American readers, at least in an abridged translation, from which matters of merely local importance could be omitted. Perhaps space may still be spared here for three or four striking passages. Many of these are from the letters of Prince Albert. Thus, he likened the situation of the Emperor of the French to that of a theatrical manager whose audience expect a new play every day. Of the Chevalier Bunsen he writes: "Bunsen is the complete opposite of a diplomat: his best qualities are those which for such a calling are the most dangerous—particularly his incredible fecundity and imagination. In 1848 I saw him elaborate to the minutest detail at least five complete constitutions for Germany and as many for Prussia, each of them proceeding from entirely different principles." In March, 1854, the Duke attended a council held by Napoleon with almost all the principal French generals. On going away he expressed, to Marshal Magnan, his surprise at the absence of St. Arnaud, who had been selected to command the expedition against Russia. Magnan answered, with the appearance of the utmost indifference, that it did not matter whether the man were present or not; St. Arnaud was sickly, he said, and would not carry the thing through. "La canaille crèvera en route," he concluded. The peculiar mixture of contempt and venom conveyed in these few words could hardly be adequately expressed in English. A phrase from a letter which Napoleon wrote from the scene of war in Italy in 1859 to his war minister at home, found unmistakable confirmation in 1870. Complaining of the deficient equipment of the army, he says: "I am not reproaching you. I only address myself to the general system, from which it results that in France we are never ready for war." He might have added that unfortunately France is only too ready to provoke war.

The Unknown Horn of Africa. An Exploration from Berbera to the Leopard River. By F. L. James. With additions by J. G. Thrupp. London: G. Philip & Son. 1888. Pp. xiv, 344, 8vo.

SOMALI-LAND is that part of Africa which lies east of a line drawn south from the head of the Gulf of Aden to the Indian Ocean, or what has been called from ancient days the "horn of Africa." Though comparatively valueless, it has not escaped appropriation in the recent "scramble" for Africa by the European Powers, the northern coast having been under English protection since 1884, while Germany now claims the eastern littoral. The Somals, however, a brave and warlike race of Hamitic origin, and, with the kindred but hostile Gallas, the finest of all the African peoples, have till recently successfully resisted all attempts on the part of Europeans to explore the interior of their country, turning back some and murdering others. Mr. James's expedition, of which this volume is the record, would also undoubtedly have failed but for its exceptional fitness for its difficult and dangerous task. Five of the seven Europeans composing it had served an apprenticeship together in African travel in the Sudan east of the Nile, and the head-man was one Dualla, who had been trained by Stanley on the Congo. They had all learned by experience the absolute necessity of unlimited patience and firmness in dealing with the natives, as well as of sleepless vigilance.

The starting-point was Berbera, the port from which Aden draws a large part of its supplies, and the route was directly south, the object being to reach the Leopard or Webbe Shebeyli River and follow its course to the Indian Ocean. They had no difficulty in crossing the mountains which separate the coast from the high interior plateau, and on January 3, 1885, they encamped on the edge of the Haud, a waterless plain which stretches for 250 miles to the south. Here the travellers were overtaken by messengers bringing telegrams in which Lord Granville forbade their undertaking the expedition and ordered the authorities at Aden to stop them, by force if they persisted. As they were ten days' march from Berbera, however, they determined to proceed, although the dangers of the journey were

greatly increased by the Government disapproval, which had unfortunately not been concealed from the natives.

It was no slight undertaking to cross the Haud with a caravan consisting of a hundred men and women, a hundred and thirteen camels, besides horses, mules, sheep, and oxen. For nine days they marched, the animals finding some nourishment from the coarse grass and scraggy mimosas which grew in spots, but not a drop of water was to be had save what they carried in their "huntahs." The only objects which broke the horrible monotony of the scene were an occasional antelope or bird, and the giant ant-hills, some of which were thirty feet high, tall red columns of earth, that "assumed shapes which made us imagine we were passing through a gallery of colossal statuary in terracotta." During the last three days the water-supply ran so low that they were put on an allowance of a pint a day for each man. When, on the ninth day, they reached the Hodayu Pans, they found them "quite dry and sun-baked." With almost frantic eagerness they dug holes in the pans, and soon a "number had a thin surface of dark fluid, overlying liquid mud," which was greedily drunk. The digging had to be conducted with great care, "for if the sand below the mud were exposed, it immediately sucked up every drop of water collected above it. All day and all night well-digging was continued, and by degrees we were able to partially water the horses and mules and the four Aden camels." A four-days' journey still lay between them and the southern limit of the desert, and this had to be traversed before the Somali camels could be watered. "Since leaving Burao, they had, with bad food, carried their burdens 215 miles, *travelling for thirteen days without drinking a drop of water.*" The camels which showed this unparalleled endurance are of a different species from those of the Sudan, lighter, carrying only half the burden of these, and needing food every day. "The Sudan camel, carrying 400 pounds, will go several days without food or water, but he rarely lasts six days without the latter."

The first wells which the expedition reached were "hewn out of the solid rock, and some seventy or eighty feet in depth," and of unknown origin. They were surrounded by great herds of camels, oxen, and sheep attended by shepherds who showed neither friendliness nor hostility, but simply astonishment, believing that "the white man's caravan had descended from the heavens." A strong zariba was formed about the camp, and the travellers waited patiently for a fortnight before the native chiefs would permit them to proceed. All obstacles were finally overcome, however, and the Webbe was reached two months after leaving the coast. The river at this point, apparently about midway in its course of not far from a thousand miles, is nearly sixty yards wide, and yet this great volume of water never reaches the ocean, but "loses itself in a vast swamp a few miles from the coast." The land along the banks is extensively cultivated; corn, pumpkins, beans, melons, and cotton being grown. The natives are mainly negroes, called Adones, but the governing classes, a mere handful in comparison, are Somals. They are Mohammedans, their principal village, Barri, containing "a school, where we found boys reciting the Koran." All the large game of Africa is to be found at or near the river, which was "literally swarming with crocodiles," the natives being obliged for protection against them to make zaribas in which to water their animals. A fortunate shot by which one of these pests was killed on the day of their arrival had much to do with the friendly treatment which the travellers received.

Notwithstanding the peaceable behavior of the Adones, Mr. James could not prevail upon his men to go further down the river, and he was reluctantly compelled to retrace his steps after a stay at Barri of three weeks. The homeward journey was by a caravan-road, slightly to the west of the route by which they came, and was unmarked by any special incident. The crossing of the Haud was comparatively easy, as the rains had begun, and Berbera was safely reached by the middle of April. This successful traversing a land of which it has been recently said, "to be killed was the fate of nearly every white man who ventured" into it, without losing a man or firing a shot in anger, though there were daily provocations and hostile demonstrations, places Mr. James and his companions in the front rank of African travellers. The secret of their success was partly owing to the effect produced by their firearms, of which the natives in the interior were entirely ignorant. But it was chiefly due to their considerate tact in dealing with them, and the ceaseless vigilance which they maintained. The natives were never trusted for a moment, even when most friendly. It was for the lack of this suspicious caution that the Italian exploring expedition under Count Porro was massacred the next year, not in 1885, as Mr. James erroneously states.

From a geographical point of view the expedition was not so successful. It passed through a part of the country which had never before been visited by Europeans, and reached the Webbe, but unfortunately had no opportunity to explore its course in either direction, so as to settle the questions as to its source and relations to the river Jub. The ethnographical facts in regard to the origin, habits, and religion of the various tribes inhabiting Ogadayn, the region to the south of the great plain, are rather meagre, though very possibly they did not differ materially from the well-known coast tribes. Far different were the results as respects natural science. The collections of the fauna and flora of the Somali-land were very large and valuable, containing many species new to science. These are described in an appendix by different scientific specialists.

Mr. James writes easily and with some humor, though he is at times a little coarse and his work lacks revision. The following description of the camp at night is picturesque and graphic:

"As darkness came on and the camp-fires shone out, the scene was lurid and almost theatrical—the camels parked and all kneeling; the horses and mules tethered on one side, and the sheep huddled together on the other, the fancy attitudes of all our men and women, with their clean white tobes falling gracefully about their figures, the gleaming spear-heads and glinting rifle-barrels, and the unceasing babble in an unknown tongue. Then a moment of silence, while several dozen men advanced a short distance carrying their prayer-carpets. Standing in long line with Dualla a few paces to the front, they chanted an evening orison, and then, kneeling on their carpets, bent forward till each man's forehead touched the earth."

This volume, which in typographical excellence leaves little to be desired, is made still more attractive by some very beautiful colored plates of the new species of animals and birds, collected principally by Mr. E. Lort-Phillips. We cannot praise so highly the "narrative illustrations," some of which, however, are not without force, and all are, apparently, faithful representations of the natives and the scenery. There is also an admirable map, the work of Messrs. W. D. James and Percy Aylmer

The Cavaliers and Roundheads of Barbados. 1650–1652. With some Account of the Early History of Barbados. By N. Darnell Davis. Georgetown, British Guiana: *Argosy* Press. Pp. 261.

THIS attractive little volume is creditable to the author and to the printer, and shows that the heat of the tropics is no bar to mental effort or to skilled mechanical labor. As the title indicates, it does not profess to be a history of that very interesting island, but merely a chronicle of one episode in its history.

The first settlement of Barbados was in 1627, by vessels sent out by Sir William Courteen of London, under a grant to Philip Herbert, Earl of Montgomery, afterwards Earl of Pembroke. But King James also made a grant to James Hay, Earl of Carlisle, which was decided in 1629 to be of higher authority, and the latter nobleman became Lord Proprietor. The island proved very attractive to colonists, of whom in 1636 there were about 6,000 Englishmen, some 750 of whom owned ten acres or more. In 1645 there were 5,680 negro slaves there; the sugar industry having been established by Col. James Draxe. At that date there were 18,300 effective men on the island, 11,200 being proprietors, and in 1650 the total population was computed at 30,000.

Our author gives the following list of the first colonists whose names have become extinct there: Bourchier, Bromley, Byron, Carey, Carleton, Conyers, Coverley, Darell, Digby, Dimock, Estwick, Fitz James, Fortescue, Frere, Godwin, Hawley, Hay, Howard, Isham, Jermyn, Kendall, Lacy, Lee, Littleton, Middleton, Modiford, Needham, Ogle, Ouseley, Pickering, Prideaux, Quintins, Rich, Rous, Rowland, Russell, Shelly, Southwell, Tyrell, Usher, Walmsley, Wells, and Woodhouse. The next list is of those still represented there or in the neighboring islands: Alleyne, Austin, Briggs, Buckley, Burrowes, Byam, Chester, Clarke, Clinkett, Codrington, Cox, Dottin, Edwardes, Ellis, Farmer, Gill, Gibbes, Gittens, Hawtayne, Jones, Kirton, Marshall, Martin, Mathew, Maycock, Mills, Moss, Parris, Parsons, Pearce, Sandiford, Taylor, Thornhill, Redwood, Walrond, Waterman, and Webb. It may be added that the communication with Virginia and New England was constant, and that many emigrants seem to have gone first to the island and then to the mainland.

In 1646, the Earl of Carlyle leased the island for the term of twenty-one years to Francis, Lord Willoughby of Parham. The majority of the planters, led by Colonel Humphrey Walrond, were Cavaliers; but an influential minority were for Parliament, and of these Colonel Draxe was chief. The loyalty of the islanders found vent in a proclamation issued May 1, 1650, proclaiming Charles II. King, and declaring the Book of Common Prayer the only pattern of true worship. Lord Willoughby arrived out there at this juncture and assumed control. For about a year the Royalists held the power, imprisoning, fining, and banishing their opponents. But in England, Parliament was not unmindful of this rebellion, and measures were taken to assert its supremacy. A squadron of seven vessels, with 860 men and 238 guns, under the command of Sir George Ayscue, sailed August 5, 1651. This fleet duly arrived, and found the island well defended by a force estimated at 5,000 men. A blockade was established, and on one occasion troops were landed and a successful attack made.

The battle of Worcester was fought September 3, 1651, and two months later Admiral Ayscue sent official information to Lord Willough-

by, together with an intercepted letter from his wife urging his submission. Willoughby held out for some two months, but the defection of Colonel Modiford and others, who saw the folly of a contest with England, finally caused a treaty to be accepted, on January 11, 1652. By it liberty of conscience was granted, and it was provided that "no taxes, customs, imposts, loans or excise shall be laid nor levy made on any the inhabitants of this island, without their consent in a General Assembly." Lord Willoughby was to be restored to all his lands in England or in the other colonies, though he was to leave Barbados. Nine of his principal adherents were also banished, but apparently without any confiscation of estates; and the island peaceably submitted to Daniel Searle as Governor for the Parliament.

Thus ended the contest; and the story is clearly told by Mr. Davis, without prolixity or exaggeration. Although not a great matter, it was a characteristic one, and is well worth telling.

Afloat (*Sur l'eau*). By Guy de Maupassant. With illustrations by Rou. Translated by Laura Ensor. George Routledge & Sons. 1889. Pp. 256.

LAST spring, immediately after the publication of 'Pierre et Jean,' M. Guy de Maupassant went off for a solitary coasting trip along the French shore of the Mediterranean, in his little yacht *Bel-Ami*. The present volume is the record of his ten days' voyage: of what he saw, and his musings thereupon. M. de Maupassant is more than anything else a poet, and can bear solitude and at times rejoice in it. He experiences a keen delight at feeling himself to be a part of all life, rather than a part of merely human life. But there is very little of the joy of life in his book. Parts of it are thick with inspissated gloom. It might have been written by his own poet, Norbert de Varenne. That most men are weak and miserable, and the rest strong and miserable; that we know nothing; that war is horrible, and love empty and vain, and friendship exacting, and the life of society, and especially of courts, ridiculous; that the most delicately organized beings suffer most keenly; that helpless poverty, and sickness, and old age are dreadful things—these are the themes of his musings.

They are not new, and perhaps not truer today than they were yesterday, and M. de Maupassant can point out no way of escape from them. If he could grasp the whole sorry scheme of things, and shatter and remodel it, he would live, he says, after his heart's desire, in a palace, by the sea, apart from men, with everything to gratify the senses and the mind, in peace. But, surely, this would be a honey bitterer than any gall. For this world, after all is said against it, is at least better than a Mohammedan paradise, and the house of mourning better than the house of feasting for whatever is best in man. M. de Maupassant might well be content to accept this truth; for it is precisely because this is true that his book, blackly pessimistic as it is, outweighs in value a wilderness of Tartarins.

The book is not all of it new. Part—not the best—saw the light in the *Revue Bleue* some time last summer, a part in *Les Lettres et les Arts*. It makes a handsome volume, with illustrations of the Tartarin stripe.

The Dead Leman, and Other Tales from the French. By Andrew Lang and Paul Sylvester. Scribner & Welford. 1889. 8vo, pp. xvi, 336.

THIS is a volume of short stories by authors of repute, and is a well-meant attempt to cultivate in England a taste for the *conte*. English readers are intolerant of short stories, especially if they appear in a volume, the translators sorrowfully admit, but they hope against hope that the present collection may win some hearts. It consists of Gautier's "La Morte Amoureuse," two of Mérimée's tales, one each of About's and "Th. Bentzon's," one of Tolstoi's, and Balzac's "La Grande Brétêche."

The work of the translators seems to us to deserve less than entire praise. Their English is not always clear, nor always elegant, nor always devoid of affectation. Such phrases as "meseemed that I had fallen on sleep" very inadequately reproduce "the faint archaism, the perfume, the poetry of Gautier's prose," while one passage in the Tolstoi story is simply unintelligible. In this story, too, there is a yet graver fault: the translators follow, or make, a version of "A Candle" in which the ending of the tale is quite changed, and the wicked prikáshtchik dies of drink instead of meeting the violent death which Tolstoi describes, and which the plan of the story demands. The tales of which the volume is made up are all well known, and call for no remark, save possibly this: that the book may impress some readers, perhaps almost startlingly, with a sense of the gulf that lies between the work of writers like Gautier and Mérimée—or even of Balzac—and the work of a writer who seems vast as the Steppes.

BOOKS OF THE WEEK.

Adams, W. D. By-Ways in Bookland: Short Essays on Literary Subjects. Lockwood & Coombes. $1.25.
Alcott, Louisa M. A Modern Mephistopheles. Boston: Roberts Bros.

THE AUSTRALIAN BALLOT SYSTEM.
By J. H. WIGMORE.

Cloth, $1.00, net; paper, 75 cents, net.

A compilation of the Ballot Acts of various Countries and States—under the system of secret balloting known as the Australian. With an Historical Introduction and Notes.

Published by CHARLES C. SOULE,
15⅓ Beacon St., BOSTON.

NICE HOME IN THE CENTRE OF Paris is offered to a young man or a young lady during the Exhibition. For full information write M. L. D., care of the *Nation*.

ANOTHER BRIGHT FRENCH NOVEL.

VAILLANTE.

By JACQUES VINCENT, ouvrage couronné par l'Académie Française. (No. 12 of Romans Choisis.) 12mo, 60c.

This delightful story of a young girl's career will demonstrate not only the ability of French writers to write pure, healthful, interesting romances, but also the possibilities of worldly success within the reach of woman if accompanied by energy, activity, and intelligence. The heroine of this romance is only a poor donkey-driver in the beginning, yet the story ends with her as a brilliant woman, honored and admired by the world, her success being almost wholly due to her own pluck, energy, and right-mindedness.

CLASSIQUES FRANCAIS.

The handsomest, best, and cheapest edition of the French classic writers yet published; tastefully printed, with elaborate English notes, by competent professors of the language.

NOW READY:

L'AVARE, by Molière.....20c.
LE CID, by Corneille.....20c.

LES GENRE DES NOMS.
12mo, 25c.

A treatise on the gender of French nouns, of much value to students, as nearly all French nouns are either masculine or feminine.

Full list of French publications, and new catalogue of general French literature and school-books, sent on application to

WILLIAM R. JENKINS,
851 and 853 Sixth Avenue, New York.

A Timely Treatise.

THE CENTENNIAL OF A REVOLUTION: An Address by a Revolutionist. 1888. pp. 171. 12mo, cloth, $1.25.

The author of this anonymous discourse is John Codman Hurd, LL.D., author of 'The Law of Freedom and Bondage' (1858), and of 'The Theory of Our National Existence' (1881). In this publication the writer professes to have accepted, against his earlier convictions, a Revolutionary origin for the Constitution, in 1787-9, and attempts, by a course of ironical argumentation, to expose the logical consequences of taking such an assumption as the basis for the extreme national theory and the refutation of the fallacies of the State-rights doctrine. The views actually sustained by the author are those presented in his earlier writings.

G. P. Putnam's Sons,
27 and 29 West 23d St., N. Y.,

MACMILLAN & Co.'s NEW BOOKS.

Sir Monier Williams's Important Work on Buddhism.

BUDDHISM: in its Connection with Brahminism and Hinduism

and in its Contrast with Christianity. Being the Duff Lectures for 1888. By Sir Monier Williams, M.C.I.E., D.C.L., etc. With 15 Illustrations. 8vo, $5.25.

A New Work by Archdeacon Farrar.

LIVES OF THE FATHERS. Sketches of Church History

in Biography. By Frederic W. Farrar, D.D., F.R.S., Archdeacon of Westminster and Chaplain in Ordinary to the Queen. Two volumes, large 12mo, $5.

Forming a sequel to 'The Life of Christ,' and 'The Life and Works of St. Paul,' by the same author.

CONTENTS:

St. Ignatius of Antioch.	St. Cyprian.	St. Athanasius.	Gregory of Nyssa.
St. Polycarp of Smyrna.	St. Clement of Alexandria.	St. Hilary of Poictiers.	St. Ambrose.
St. Irenæus.	Origen.	St. Martin of Tours.	St. Jerome.
St. Justin the Martyr.	St. Basil	St. Gregory of Nazianzus.	St. Augustine.
Tertullian.			St. Chrysostom.

"These names are household words, but the details of their lives and of the times in which they lived are not so familiar to the minds of clergy and laity as they will be after these highly interesting volumes of Dr. Farrar shall have been studied. We say clergy and laity, for this book is intended for both. . . . Many a student would be freed from sectarianism, narrow ecclesiasticism, bigotry, and theological uncharitableness by a careful study of the writings to which Canon Farrar's book will prove an excellent introduction."—*Churchman.*

"One of the most valuable additions recently made to religious biographical literature."—*Boston Evening Transcript.*

"It is the great praise of Dr. Farrar that he does just this. Thousands first learned from his 'Life of Christ' how to understand the Gospels. . . . The author gives us vivid and life-like portraits of the chief writers in the early Church, and incidental glimpses of their contemporaries. We have, therefore, Church history in its most alluring form—in the lives and achievements of the men who made the history."—*Examiner.*

Now Ready: Vols. 1 and 2, with Portraits. 12mo, 60 cents each, cloth limp, edges uncut, 75 cents.

ENGLISH MEN OF ACTION.

GENERAL GORDON. By Colonel Sir William Butler.

"Sir William Butler tells the story of Gordon's life as a brother officer should. The interest never flags and the narrative is imbued with a deep feeling of reverence."—*St. James's Gazette.*

"Sir William Butler's 'Charles George Gordon' makes a worthy initial volume to Messrs. Macmillan & Co.'s new series of biographies under the title of 'English Men of Action.' The story of Gordon's life has three conspicuous merits—it is briefly told, it is graphic, and it is discriminating."—*London Daily News.*

HENRY THE FIFTH. By the Rev. A. J. Church. *Ready.*

The Volumes to follow are:

LIVINGSTONE. By Mr. Thomas Hughes. *April.* LORD LAWRENCE. By Sir Richard Temple. *May.*

WELLINGTON. By Mr. George Hooper. *June.*

Volumes 1 to 5. 12mo, cloth, limp, each 60 cents; edges uncut, 75 cents.

TWELVE ENGLISH STATESMEN.

"Macmillan's admirable series, 'Twelve English Statesmen.' "—*San Francisco Chronicle.*

WILLIAM, THE CONQUEROR. By Edward A. Freeman, M.A.

"This book has a definitiveness of its own because Mr. Freeman has honestly endeavored to set William in his place as the chief among the makers of England."—*Saturday Review.*

"The series to which it belongs could not have been more happily inaugurated."—*Chicago News.*

HENRY THE SECOND. By Mrs. J. R. Green.

"That remarkable book, 'Henry the Second,' by Mrs. J. R. Green."—*Nation.*

"This excellent series cannot fail to do good service to the cause of public education."—*Standard of the Cross.*

WOLSEY. By Professor M. Creighton.

"Dr. Creighton, like Prof. Freeman, has devoted years to the study of a period, and consequently in writing of Wolsey he draws easily from a great range of knowledge."—*New Haven Register.*

OLIVER CROMWELL. By Frederic Harrison.

"Let the reader not take this praise for momentary enthusiasm. Let him first read Frederic Harrison's present little book on Oliver Cromwell, and, ten to one, he will share the enthusiasm."—*New York Times.*

"A brilliantly written, appreciative, and thoroughly studied summary of the greatest statesman who ever ruled Great Britain."—*Independent.*

WILLIAM THE THIRD. By H. D. Traill.

"The book is almost an education itself in the existing politics of the era with which it deals, and exceptionally interesting reading matter from beginning to end. . . . If the other contributions to the series are as thorough and as unconventional as those which have already appeared, the set, when completed, will achieve a permanent and standard reputation."—*Boston Saturday Evening Gazette.*

The Volumes to follow are:

EDWARD I. By F. York Powell.
HENRY VII. By James Gairdner.
ELIZABETH. By the Dean of St. Paul's.
WALPOLE. By John Morley.
CHATHAM. By John Morley.
PITT. By John Morley.
PEEL. By J. R. Thursfield.

CLARENDON PRESS NEW BOOKS.

ESSAYS BY THE LATE MARK PATTISON, Sometime Rector of Lincoln College, Oxford.

Collected and arranged by Henry Nettleship, M.A., Professor of Latin, Oxford. 2 vols. 8vo, $6.

*** With one exception, the essays in these volumes are a selection of what seemed to be the most interesting and valuable among the many papers and articles published by Mr. Pattison between the years 1845 and 1882. The fragment on the Life of Joseph Scaliger is printed from the author's MS., and forms part of his unfinished Life of Scaliger.

THE DYNASTY OF THEODOSIUS; or Eighty Years' Struggle with the Barbarians.

By Thomas Hodgkin, Hon. D.C.L., author of 'Italy and Her Invaders.' 12mo, $1.50.

*** Describes in brief the leading events recorded in the first two volumes of 'Italy and her Invaders.'

NATURAL INHERITANCE.

By Francis Galton, author of 'English Men of Science; Their Nature and Nurture,' 'Hereditary Genius,' etc., etc. 8vo, $2.50.

THE STATESMAN'S YEAR-BOOK.

A Statistical and Historical Account of the States of the Civilized World. For the Year 1889. Edited by J. Scott Keltie. Revised after Official Returns. 12mo, $3.00.

"That most useful of all reference annuals. . . . Mr. Keltie has improved this invaluable work, year by year, until now the most critical of critics announces that he can discover no mistakes."—*G. W. S., in New York Tribune.*

A New Volume of the History of English Literature.

A HISTORY OF ENGLISH LITERATURE IN THE EIGHTEENTH CENTURY.

By Edmund Gosse, Clark Lecturer on English Literature in the University of Cambridge, etc., forming the Third Volume of "A History of English Literature" in four volumes. 12mo, Students' Edition, $1; Library Edition on thicker paper, $1.75.

Vol. I. THE EARLIEST PERIOD. By the Rev. Stopford Brooke. *Preparing.*

Vol. II. AGE OF ELIZABETH. By George Saintsbury. *Ready.*

Vol. III. THE EIGHTEENTH CENTURY. By Edmund Gosse. *Ready.*

Vol. IV. MODERN PERIOD. By Edward Dowden. *Preparing.*

Press Notices of the Second and Third Volumes.

"A thoroughly delightful book. Mr. Saintsbury is recognized as one of the best writers in England, and he has now a subject exactly suited to him. The Elizabethan literature, for quality and quantity, taken together, is unequalled by any similar body of writings in the world."—*Epoch.*

"The book is written with the vigor and insight of an accomplished critic. Mr. Saintsbury's strong and graceful style is well known, and it imparts a special charm to this able and instructive history."—*Scotsman.*

"Lovers of the literary art, literary students, and all readers of taste will find Mr. Saintsbury's volume a great treasure and a delightful companion."—*Boston Beacon.*

"In fact, 'Eighteenth Century Literature' is far from being exclusively adapted to students. The criticisms are never tedious or dry, and the short biographies contain interesting personal details of writers some of whom are little known. We shall be surprised if the work is not as popular with the general public as with those who may claim a special knowledge of its subject."—*London Athenæum.*

"Mr. Gosse's book is one for the student because of its fulness, its trustwortniness, and its thorough soundness of criticism, and one for the general reader because of its pleasantness and interest. It is a book, indeed, not easy to put down or to part with."—*London Academy.*

"It is enough to say that Mr. Gosse has written a volume which is entertaining enough to interest the general reader and judicious enough to afford suggestions and aids to the student. So broad a field could not be covered in the space at command, but what has been done has been done well."—*New York Tribune.*

"The best handbook on the subject."—*New York Sun.*

"No study of eighteenth-century English literature is comparable to Mr. Gosse's history for wealth of treatment and vivacity of style. It is a book that not only ought to be read for the wealth of learning which it contains, but also for the charming manner in which it is written."—*Boston Beacon.*

"We welcome his book as a valuable and worthy addition to that series which Mr. Saintsbury so well began with his history of the age of Elizabeth."—*Boston Daily Advertiser.*

ELEMENTARY SYNTHETIC GEOMETRY OF THE POINT, LINE, AND CIRCLE IN THE PLANE.

By N. F. Dupuis, M.A., F.R.S.C., Professor of Pure Mathematics in the University of Queen's College, Kingston, Canada. 16mo, $1.10.

MACMILLAN & Co., 112 Fourth Avenue, New York.

The Nation.

NEW YORK, THURSDAY, MARCH 28, 1889.

The Week.

A MORE melancholy picture of the humiliating position into which the spoils system forces a President, could not be drawn than is Mr. Harrison's own statement of his present situation. The Washington correspondent of the *World* says, that the President is growing very restless under the criticism made upon the deliberation with which he is filling the important offices, and that to an importunate Congressman who called to urge the claims of a constituent for office he said: "I am daily criticised in the papers, and even by individuals who call upon me in quest of office, for being slow to nominate men for those important missions. The reason is the simplest in the world. I have not had time. I have been overrun with office-seekers since I arrived in Washington, and instead of having the time to devote to the consideration and selection of foreign ministers and other important officials, I have actually spent it all in listening to the statements of delegations, and in the purely clerical labor incident to the proper classification and arrangement of applications for office." Think of the chief executive of a great nation, with all the onerous duties which devolve upon such an official, which of themselves would consume all his time and strength, complaining that he has to spend all his time and use up all his strength in listening to the pleas of spoils-hunters, and in performing the purely clerical labor of classifying and arranging applications for office!

Secretary Windom has had the following notice posted in the Treasury:

"The Secretary of the Treasury reserves the time from 10 till 11:30 A. M. for receiving Senators and members of the House of Representatives. Other persons desiring to see him upon matters relating to official patronage will please call between 11:30 A. M. and 1 P. M. The Secretary requests that he may be excused from receiving visitors after 1 P. M., in order that he may be able to devote a part of the day to the consideration of the current business of the Department."

It appears from this that the Secretary begins his official day at 10 A. M.—a very proper hour—but does not reach the business of the Government, or "the current business of the Department," as he calls it, until 1 P. M., after three hours of that most exhausting of occupations, listening to people who, in nine cases out of ten, are making either impossible requests or impracticable suggestions. We grant that he ought to give some portion of the day to interviews with Senators and Representatives on public business, but we presume there can be no doubt that the business he transacts with them between 10 and 11:30 A. M. is of precisely the same nature as that which he transacts with the persons who come to "see him upon matters relating to official patronage," between 11:30 A. M. and 1 P. M. That is, he spends three hours of his day talking about "spoils" with importunate beggars to whom the taxpayers whom he represents, and with whose interests he is charged, owe nothing whatever. Consequently, he comes to his own sworn work jaded in mind and body, and is compelled, when in arrears with it, to take out of the hours which he owes to health and recreation, enough time to make up for what he has lost with office-seekers in the morning. All this waste of time and strength is the direct result of the practice of treating offices as party booty, and making changes in the service simply to satisfy electioneering claims. In other words, half the official time of the Minister of Finance of the greatest commercial and manufacturing State in the world is given to consultation over plans for corrupting the fiscal administration and diminishing its efficiency.

The appointment of Corporal Tanner as head of the Pension Bureau commits the Administration to support of the wholesale pension schemes which are so zealously pushed by the claim-agents and the politicians who make bids for the "soldier vote." Tanner is one of the most prominent of the Grand Army politicians who have converted that organization into a machine for securing pensions, and, as the Washington correspondent of the *Press* says, "has long been regarded as a pension liberalist of the most pronounced type." The same correspondent says that "Tanner's appointment is generally regarded as the beginning of a new pension era. It may, and likely will, result in universal pensions as the simplest and cheapest way out of it. In fact, a universal-pension bill will early be introduced in the next Congress, and, unless it should be deemed inexpedient and killed by caucus, it will become a law." We regret to say that there is too much reason to fear that this forecast will prove to have been correct.

Republican newspapers as a rule thus far are slow in expressing any opinion regarding the New York Post-office. Occasionally one is found, like the Rochester *Democrat and Chronicle*, edited by the Hon. Charles E. Fitch, Professor of Journalism, which takes the ground that Mr. Pearson ought not to be reappointed, on the ground that he "has had the place long enough"; but most of them take refuge in silence. An honorable exception is found in the case of the Buffalo *Express*, which says that Mr. Pearson "is a Republican who has so nobly vindicated the principles of his party during the last four years that the Democratic Administration could find no pretext for removing him," and makes this comment upon the course of those Republican papers which advise President Harrison not to reappoint him: "They invite him to write himself down lower than Grover Cleveland. Such counsel is an insult to President Harrison's intelligence, to say nothing of his civil-service-reform professions."

The Indianapolis *Journal* publishes a leading editorial article which, without mentioning the new Postmaster in that city, rebukes all spoilsmen who talk about the Civil-Service Law in the way he is quoted as talking. The *Journal* begins with the statement that "the Republican party is pledged in every possible way to the principle of civil-service reform, as embraced in the present law and the rules under it." After setting forth the scope of the law, it explains its application to the Indianapolis Post-office, which is the only one in the State embraced by the statute. It points out that, with the exception of ten positions out of about one hundred, all the places are subject to the law, and that, while the incumbents may be removed at pleasure, their successors can only be appointed in accordance with civil-service rules. "The Postmaster," it adds, "can discharge a clerk or carrier for any cause satisfactory to himself, but he cannot appoint one except in compliance with the Civil-Service Law; *and if a vacancy is to be filled, the law does not permit him to know whether it will be filled by a Republican or a Democrat.*" In order to leave no possible doubt as to its meaning, the *Journal* concludes with the following remark, which Postmaster Wallace may well regard as in the light of a warning: "The idea that the law can be construed out of existence, or juggled with in such a way as to run Republicans in without complying with its provisions, is a great mistake."

Justice Stanley Matthews, who died on Thursday, had been a member of the Supreme Court for about eight years, having been confirmed by a very narrow margin in the spring of 1881, upon President Garfield's nomination, after his name had been rejected when sent in by President Hayes the previous winter. He had served four years in the Senate, and his record in favor of the permanency of the greenbacks, the payment of the public debt in depreciated silver, and the unlimited coinage of silver, rendered his selection for the highest bench a surprise and disappointment to the country. Although a good lawyer, he had never won the highest rank in his profession, and his service as judge has been without special distinction. His death precipitates upon the President a fresh contest for place which must almost make him despair. Ohio will undoubtedly insist upon the succession, as she has not got much so far, and is now left without representation in the Supreme Court for the first time in sixty years. John McLean, who was appointed by Jackson in 1829, served until 1861, and was succeeded by Noah H. Swayne, who was given Salmon P. Chase as a colleague in 1864, and Morrison R. Waite upon Chase's death in 1873. Swayne retired in 1881, and was succeeded by Matthews; while William B. Woods, who was appointed in 1880, and credited to Georgia, al-

ways remained much more an Ohio man than a representative of the South.

There are strong reasons for believing that complete ballot-reform laws will be passed in at least two more States before the close of their present legislative sessions, namely, Missouri and Wisconsin. It is possible that Connecticut also will be added to the list, though the Republican majority in that State appears to be acting in a double-faced way in regard to the subject. While seeing the necessity of paying heed to the strong public demand for such legislation, the Republicans do not yet unite in favor of a bill which embodies the most approved principles of the reform system. In Missouri all authorities agree that the Legislature will pass a bill embodying a complete application of the Australian system. In Wisconsin the Senate has passed a bill extending the provisions of the present admirable Milwaukee law and making them applicable to the entire State. As passed, this bill provides for secret, official ballots printed and distributed at the public expense. It is interesting to note that in all quarters of the country in which the ballot question is discussed, Gov. Hill is recognized as the leading enemy of the reform.

The movement among American artists for the repeal of the duty on works of art is a step which ought to have been taken some time ago. That all except a feeble minority of our artists feel pained and humiliated by this duty, has been known to Congress ever since the present tax of 30 per cent. was imposed, but Congress does not pay attention to unorganized opinion on any subject. If the artists take steps to organize their opinion, they can make it effective. We notice that one of the speakers at the late meeting wanted a definition of works of art, so that the term might not include chromos and colored photographs, but should be limited to paintings in oil and water colors. This would be a fair distinction if the Treasury wanted the money collected on such works. But since it does not, the distinction seems to be either frivolous or of a protective character. In either case it should not be allowed, and we venture the prediction that Congress will never allow the pictures which rich men buy to come in free, while the humbler decorations of the poor man's home are taxed 30 per cent.

Somebody in Washington has been "stuffing" the correspondent of the Springfield *Republican*. He writes on Saturday:

"Treasury officials say there is no reason why the work of Secretary Fairchild in ferreting out the sugar frauds should be affected at present by the change of Administration. If the work had been left half completed, there might have been some reason to fear that it would not be carried forward, but it was left so near done that it is only a question of 'letting well enough alone.' Secretary Fairchild restored the proper method of appraisement, and he dismissed the men who had been guilty of dishonesty, and put new men in their places."

There is not one word of truth in this. Secretary Fairchild "ferreted out" no "sugar frauds." He does not even pretend now that he did. He did not "restore the proper method of appraisement," because he found no wrong method. He did not dismiss men "guilty of dishonesty." He dismissed men against whom he brought charges for which he had no proper evidence whatever, and whom he never brought before any tribunal, and whom he stultified himself by slandering on the eve of his own retirement from office.

Mr. Henry C. Bowen, the senior editor of the *Independent*, accuses us of falsehood in saying that the evidence against Quay and Clarkson in the matter of the theft of the *Voice's* mail-lists was "undisputed," inasmuch as the *Independent* had "published the completest denials authorized by both Clarkson and Quay." We notice Mr. Bowen as often as we do, because he edits the only religious paper which has ventured with openness and minuteness to undertake the defence or vindication of the various prominent Republican corruptionists of the late canvass. But it is impossible to treat him very seriously. He was expelled from his church in Brooklyn on the 18th of May, 1876, for repeated and complicated lying, when he was about fifty years old, a misfortune which usually extinguishes a moralist for ever. We had had before this, to wit, on the 8th of October, 1874, to expose his secret sale of his columns to the old Northern Pacific Railroad, under a contract by which he bound himself, in consideration of $50,000 in bonds and $460,000 in stock (which he actually received), to give the "exclusive interest and influence of his money and editorial columns" to promote the sale of the securities of the road. After Jay Cooke's failure, the trustee in bankruptcy discovered the transaction, demanded restitution, on the ground that the contract was immoral, and legal proceedings were, we believe, begun to compel it, but somehow the editor managed to hold on to his booty. Controversy about truthfulness or journalistic honor with such a man is of course a little ridiculous, but we will continue it far enough to say that the Quay-Clarkson "completest denials" in the *Independent* consist simply of an assertion by Mr. Bowen that "he is authorized to say that these gentlemen make the following statements," which "statements" are simply quibbles or evasions. The matter will, we believe, almost certainly soon come before the courts at the instance of the *Voice*, so that we need to say no more about it now.

In a speech in the Assembly on Friday, the Speaker, Mr. Fremont Cole, made the following remarkable statement concerning the mysterious appearance of $4,000 upon his private bank account about the 1st of November last:

"Then the State Committee, in its kindness, in its generosity, realizing the fact, I presume, that I was in the native county of Gov. Hill, that we have a large vote that is questionable, sent quite a large amount of money into that county. Of course, my friends, perhaps that was not a wise thing. Perhaps it was not a wise thing for me to be the receiver of that money. Yet I have explained the facts. I have withheld nothing. I have told Mr. Seward and the other attorney the places where that money came from. It came from Republicans high up in official life; it came, a large part of it—almost all of it, with the exception of a few hundred dollars—from the State Committee, and yet they say that should be explained."

This is as frank a confession as that of Mr. Ainsworth to the effect that, if it had not been for the ceiling job, Harrison would not have been elected.

Trust certificates are becoming the favorite gamble in Wall Street, and the rapid rise of the Sugar Trust has given a great impetus to the trading. Of course speculators will take hold of anything that they see, or think they see, a profit in, but the investing public should not be deluded by the idea that Trusts are safe places for money in the long run. They have as yet no legal status, and in the present temper of the public mind they are not likely to gain any. They have not the element of continuity, and they cannot acquire it. Dodging from one State to another to pick up charters, they take on a fugitive character, which should make people cautious about putting money into them. It has been held in this State that a corporation is dissolved by going into a Trust. Therefore all corporations are dissolvable which go into Trusts. The next step of the Trust will probably be to get the dissolved corporation reincorporated in another State until that State dissolves it. But eventually all the States will spew them out, and we think the process will be rapid as the monopoly character of Trusts discloses itself.

The Dundee (Scotland) *Advertiser*, commenting on the recent decision of the United States Supreme Court in the Oregonian Railway case, says:

"Whatever are the grounds on which the Supreme Court has set aside the decision of Judge Deady, this decision will give a serious blow to American credit in this country. The faith of British investors in the safety of contracts under the Constitution of the United States, which has hitherto been free from doubt or fear, will receive a rude shock, and the remarkable passage in Mr. Bryce's new book, which practically suggests that even the highest of the American judges cannot be trusted where questions as between States are concerned, will receive a meaning which could not till now have been read in it."

The immediate occasion for this comment on judicial honor and American credit is the fact stated by the *Advertiser* that the Oregonian Railway securities—stocks, bonds, and claims of various kinds amounting to £540,000—are held in Dundee and the vicinity thereof. The decision in the case, as we recall it, was to the effect that a corporation cannot exercise powers not conferred upon it either expressly or by necessary implication, and that neither the Oregonian Railway nor the Oregon Railway and Navigation Company had the power conferred upon it to execute a lease or to receive one. This is no new principle in the line of Supreme Court decisions or in the law of corporations. In point of fact, if the court had decided the case differently, it would have been obliged to reverse itself. How far American credit would have been helped by the Supreme Court deciding questions one way to-day and another way to-morrow, we shall not undertake to determine. But if the Supreme Court of the United States has made any reputation for itself in the way of holding the scales evenly, it

has done so by holding them evenly between Americans and foreigners. The amount in controversy in this case, present and contingent, was about $800,000. To suppose that the Court took this sum of money, or any sum, into consideration in rendering the decision is too preposterous. We do not recall the passage in Mr. Bryce's book to which reference is made, but we venture to say that it does not warrant the application which the Dundee *Advertiser* gives it.

Sir Thomas Farrer's letters to the London *Times* on the Sugar-Bounties Convention have been published by the Cobden Club as a treatise for general circulation. A more destructive commentary on an economical project has seldom been put in print. It is hardly possible to conceive, after reading these letters, how the anti-bounty treaty can ever go into effect. The force relied on to make it effective is the boycotting clause, which excludes the sugar of bounty-paying countries from all the countries that are parties to the Convention. France is not a party to the Convention. Austria has made reservations which leave her at liberty to join or not according as circumstances shall appear in September, 1891, the time fixed for the Convention to go into operation. Sir Thomas shows that the effect will be merely to turn the bounty-fed sugar from England to the United States, where it will displace an equal amount of free sugar grown in the English and other West Indies. No gain will accrue to the English colonies, in whose behalf the Convention was in large part drummed up. On the other hand, England will cut herself off from the cheapest sugar that is to be had. The idea of making it a grievance that foreigners want to give you something for nothing, to make you a present of one of the most valuable and desirable products of modern art and industry, is turned into immeasurable ridicule. The operative parts of the treaty are shown to be full of difficulty, as, for example, the mode of determining whether any particular sugar is bounty-fed or not. It is a curious feature of the treaty that Great Britain alone is forbidden to levy differential duties on sugar in order to favor her own colonies. Spain and Holland, which are both parties to the Convention, and which have the largest sugar-producing colonies in the world, may do this, but England cannot.

The copper conspiracy was made the subject of debate in the French Chamber of Deputies on Thursday, and the Ministry barely escaped defeat on a motion for a public prosecution of the conspirators. But for the fact that the Ministry is only a few days old, and that the French people are beginning to feel the force of foreign criticism on the ephemeral character of their governments, it is most likely that the motion for a prosecution would have prevailed. In the end the Minister of Justice promised unequivocally that he would cause an investigation to be made, and would institute a prosecution if he should find that the law had been violated. Probably he has no serious intention of prosecuting anybody, since his colleague, the Minister of Finance, who has put himself in the attitude of a harlequin by helping the Comptoir d'Escompte to prolong its existence by about ten days, would be still further shown up as having used the powers of the State to prolong the life of the conspiracy. In the course of the debate the Paris house of Rothschild was mentioned as one of the leaders in the alleged conspiracy. M. Rouvier repelled the insinuation, saying that its refutation could be left to the good sense of the public. It is to be hoped that it will not be left to that fleeting tribunal, whose judgments are apt to be shifty and indeterminate. It is of much importance to know whether houses like the Rothschilds and the Barings, upon which the soberer classes of the community are accustomed to repose with absolute trust, are speculators, or whether they adhere through all the ages to sound principles of finance.

The *Christian Union* is engaged in a curious controversy with some Bostonians over the "Boston Monday Lectureship," a name given to himself some years ago by the Rev. Joseph Cook. It appears that the Boston correspondent of the *Christian Union* has reported that public interest in the "Monday Lectureship" is waning, and cited as proof of this the meagreness of the reports of his addresses in the daily papers. Some friends of the "Lectureship" thereupon alleged that this was unfair and misleading, and that the public interest in him was as great as ever. The *Christian Union*, however, stands its ground in the matter of fact, and now adds some reasons why public interest in the Lectureship should decline. It says:

> "He was for a few years a leader. His orthodoxy was both liberal and positive. He put rationalism on its defence; and, as an interpreter of the progressive thoughts of a foreign school of teachers, did real service to the American Church. But he lacks moral perspective. He failed to comprehend the moral and theological issues of the latter quarter of the nineteenth century. He allowed himself to become the partisan of a sect within a sect."

The truth is—the true truth, as the French say—that Mr. Cook was for some years an excellent Monday entertainment for ministers tired with their Sunday work, and for religious people of little reading or cultivation of any kind, who were puzzled by the heavy assaults on religion which followed the appearance of Darwin's book, and some smaller publications of Tyndall's and Huxley's. These simple souls were pleased with the rhetorical blows which Mr. Cook administered to the enemies of the faith, and above all with the air of "science" which he managed to give his discourses by charges of inaccuracy and blundering against real scientists. He may have "done real service to the American church"; but that he ever "put rationalism on its defence," would be hard to show. If this means anything, it must mean that some acknowledged representative or representatives of rationalism felt bound to answer him. Who were they? It ought to be easy to name them. We have not the least doubt that "the Boston Monday Lectureship," and his career from first to last, have done religion lasting harm, by giving prominence to a champion of such slender intellectual equipment and such extraordinary recklessness and inaccuracy. We might even go so far as to say that they are one of the least creditable episodes in the intellectual history of New England.

There has been no such contribution of "scientific thought" to theological controversy in a long time as that which the Rev. Dr. Talmage made in his sermon on Sunday. He was speaking of Jonah, and rebutting the charge so often made by scientists and other sceptics that Jonah could not have lived for three days in the whale's belly. Here is the answer, and we advise the Rev. Joseph Cook to look to his laurels, for it is far ahead of any of his "science" that we have ever seen:

> "And as to Jonah remaining alive in the monster's belly for three days—why, the fact is, the gastric juice had no chance—Jonah kept bobbin' around so. And what more natural than that the monster should after this regurgitate Jonah on shore? The sea monster was as tired of Jonah as he was of the fish. There's not the least bit of improbability or impracticability about it."

The theory which Dr. Talmage propounded some years ago, and which formed the subject of some acrimonious controversy with Dr. "Bob" Ingersoll, was that Jonah avoided the action of the gastric juice by taking refuge in the whale's mouth. To this Dr. Ingersoll replied that an inspection of Dr. Talmage's photograph explained how he came to entertain so grotesque a hypothesis.

The appearance of Mr. Chamberlain on the scene with a fresh plan for the settlement of the Irish question is one of the things which now lend a touch of humor to the almost tragic condition of English politics. He is said, we believe, to have now produced something like fifteen proposals for making Ireland happy, as substitutes for Gladstone's Home-Rule Bill, and they are invariably received with much laughter, owing to the fact that he has lost all the influence he ever had with his own party outside the town of Birmingham, where he is gratefully remembered as an efficient municipal reformer and administrator. For some time after he broke with the Liberals, he used to be got to write a letter in behalf of the Liberal-Unionist candidate at "bye-elections," but this was so frequently followed by Gladstonian victories that it began to be very amusing also, and he has dropped it. The trouble with all his plans, as well as with those of the Tories and Liberal Unionists generally, for the pacification of Ireland, is, that they do not take the feelings of the Irish into account. No plan can succeed which the Irish will not accept, and they will not accept any plan about which they are not consulted, and which emanates from men who habitually revile them and their leaders, as Chamberlain does. They hate him as he hates Gladstone, and will not adopt his plans for the same reason as he will not adopt Gladstone's. Human nature is distributed among politicians of all nationalities in tolerably equal proportions.

THE BEHRING SEA QUESTION.

THE President's proclamation forbidding the catching of seals in Behring Sea except by persons authorized by the United States Government, *i. e.*, the Alaska Commercial Company, is issued in pursuance of an act of Congress passed in the last days of the Cleveland Administration. This act is imperative in terms, leaving no discretion with the President. It applies to all persons, of whatever nationality. Although we cannot give law to the subjects of other nations in waters more than a marine league from our shores, we can and must bring the seal fishery within some sort of regulation, unless we are to allow the seals to be destroyed, as we have unfortunately allowed the buffalo to be destroyed on our own territory. The method we have adopted is awkward. It would have been more conformable to reason and courtesy to have concerted a plan with the other nations interested, viz., Great Britain, Russia, and Japan, before warning them off, especially since the official correspondence just published shows that all three were quite willing to join us in measures for protecting the seals.

We judge that these facts were not known to Congress when the act of March 2 was passed. We now stand before the world as having acknowledged the right of other countries to a voice in the settlement of the question, having invited them to join us in adopting a particular policy, having received their acquiescence, and then, without any kind of warning, ordered them out. This is one of the frequent *gaucheries* of the conference committees of Congress. It seems as though Mr. Bayard had been neglectful of his duties in the premises, but we cannot pronounce judgment until we know what were his reasons for not replying in 1887 to the request of the three Governments for a draft of regulations to protect the seal fisheries in Behring Sea. Under the circumstances, we cannot wonder that the Canadians are taken by surprise at the issuing of the proclamation. We may indulge the hope, however, that the proceedings taken under the proclamation may not make the situation more awkward than the act of March 2 has already made it.

It will be recalled that in 1886 and 1887 a number of schooners sailing from British Columbia were seized by our cruisers in Behring Sea for catching seals in violation of our laws. They were released because it was found upon investigation that our laws did not prohibit foreigners from catching seals there, but only our own citizens, and because the right to police Behring Sea outside the three-mile limit, although at one time asserted by Russia while Alaska was under her jurisdiction, had been virtually denied by us at that time, and was at all events a matter of dispute. The necessity of coming to an understanding with other nations claiming and exercising rights of navigation and fishing there was patent. Secretary Bayard accordingly addressed an identical note to all the Powers interested and to several not interested. Among the latter were France, Germany, and Sweden. The note invited the Governments "to enter into such an arrangement with the Government of the United States as will prevent the citizens of either country from killing seal in Behring Sea, at such times and places and by such methods as at present are pursued, and which threaten the speedy extermination of those animals and consequent serious loss to mankind." The assent of all the Governments addressed was received except those of Germany and Sweden. The former did not reply at all. The latter replied that she had no interests in Behring Sea, but would be glad to join hereafter in case her subjects should engage in the seal fishery in that quarter of the globe. The Government of France replied that she had no interests in that quarter, but would none the less be disposed to consider any plan for a conference on the subject. The reply of England was given in a despatch from Minister Phelps, dated November 12, 1887, in the following words:

> "His Lordship [Lord Salisbury] promptly acquiesced in this proposal on the part of Great Britain, and suggested that I should obtain from my Government and submit to him a sketch of a system of regulations which would be adequate for the purpose. I have therefore to request that I may be furnished as early as possible with a draft of such a code as in your judgment should be adopted. I would suggest also that copies of it be furnished at the same time to the Ministers of the United States in Germany, Sweden, and Norway, Russia, France, and Japan, in order that it may be under consideration by the Governments of those countries. A mutual agreement between all the Governments interested may thus be reached at an early day."

Here the matter was, for some unexplained reason, allowed to drop.

Our position on the Aleutian Islands is a very fortunate one. We own the trap to which the fur-seals resort in great numbers every year. Other seal-catchers can only find them in the open waters and in limited numbers, but the result of such fishing is to kill off the females and gradually to exterminate the race. Under the regulated fishing of the islands, nobody is allowed to kill the females, and thus the continuity of the fur-seal family is assured. The British Columbian seal-fisher, like the American buffalo-hunter, has no care for the continuity of the family. He is concerned only to take as many skins as possible. Obviously, something must be done to protect an industry so important to civilized mankind and to the natives of the islands, whose very existence depends upon the preservation of the fishery. The negotiation which was suspended in 1887 ought to be, and we presume will be, renewed. Although the act of March 2 has put us in an unfortunate and somewhat grotesque attitude, we cannot refuse our medicine. We have acknowledged other people's rights in Behring Sea, and we must listen to what they say.

THE PENSION SHARKS.

IN his veto of the Dependent Pension Bill, President Cleveland used the following language: "Recent personal observation and experience constrain me to refer to another result which will inevitably follow the passage of this bill. It is sad, but nevertheless true, that already in the matter of procuring pensions there exists a widespread disregard of truth and good faith, stimulated by those who as agents undertake to establish claims for pensions, heedlessly entered upon by the expectant beneficiary, encouraged, or at least not condemned, by those unwilling to obstruct a neighbor's plans."

Some Republican organs two years ago were inclined to think that the Democratic President was guilty of uttering slanders when he said this. A new witness now takes the stand, who cannot be accused either of Democratic partisanship or of a lack of sympathy with Union soldiers. Gen. H. V. Boynton, the veteran Washington correspondent of the Cincinnati *Commercial Gazette*, has just sent that journal a letter on the pension question which should command general attention. "The fact is," says Gen. Boynton, "the pension system calls for sharp revision. The pension roll is the most sacred list of the Government. It should not, therefore, be tainted even in the name of patriotism. *There have been estimates made by the best Republican friends which the soldiers ever had, which indicate that at least a quarter of the pension roll is what may be called, without harshness, unworthy.*"

Gen. Boynton points out how this state of things has come about. The chief agency has been the claim-agents, who, with their advertising dodgers and their circulars, have kept the veteran element in constant ferment on the subject of pensions. He admits that there are honorable exceptions, but says that they are few. These agents have held out false expectations, and led thousands upon thousands to apply for pensions who, except for these confidence men, would never have entertained the idea. They also work in countless and insidious ways upon every organization of veterans, and are industrious and untiring in securing petitions for every form of wholesale pension legislation, with which they spur Congressmen to one scheme after another. "As a class," he says, "they have been a demoralizing element in the country, and large numbers of them deserve no other designation than that of sharks."

The situation has become so serious that Gen. Boynton thinks it necessary to sound an alarm to prevent the national bankruptcy which would be threatened by the passage of the service-pension scheme now so zealously pushed. He shows that the appropriations for pensions for the next fiscal year reach the enormous sum of $81,750,000, and that a service pension would require in round numbers fully $100,000,000 a year more—which is, we are persuaded, an underestimate. Moreover, the question of arrears also enters here, since the proposition to remove all limits is pushed with quite as much pertinacity, and with quite as much influence, as is the scheme for a service pension. It is altogether within bounds, Gen. Boynton thinks, to say that the two propositions would carry the pension appropriation to $200,000,000; and here again most students of the subject will hold that he has underestimated the actual outgo required. As the excess of receipts over expenditures has been estimated at only $49,000,000, a great deficiency of course would

be created immediately, and taxes would have to be increased.

This vast outlay would be largely for the benefit of men who have no valid claim whatever upon the Government. Already there are far too many men drawing pensions who are not entitled to them. "There is not a community in the North," says Gen. Boynton, "where there are not men drawing pensions who, all their neighbors know well, are no longer disabled, even if they ever were. Of late years there has been more old-soldiering in connection with obtaining pensions than there ever was in the field. The fact that men were once shot, or once disabled by any of the various casualties of the field, is no equitable reason why they should remain on the pension rolls, if they are now well, unless their first disability brought them into financial need from which they haven't recovered."

What is really needed, in the opinion of this excellent authority, is not the putting of everybody who was ever in the army upon the pension roll, but a rigid scrutiny and close pruning of the present roll, to get off the names of the many who have no right to draw pensions; and then liberal provision for those who are really disabled and destitute, so that no veteran shall be obliged to remain in a poor-house or to depend upon private or organized charity. "But in order to enable the Government to perform this work on the liberal scale which should attend it," Gen. Boynton concludes his letter, "the comrades who are in health and comfortably fixed in life, or so fixed that their own efforts bring them a fair support, should scorn to ask for pensions merely on the ground of having been in the service. They should unite to devise and urge legislation to protect and support these needy ones, as they once cared for their wounded on the field. To those who carried the flag to victory and have present health and are surrounded with moderate comforts, these should be rich compensations far above any that a pension roll can give."

All this is eminently sound doctrine, and the best thing about it is that it comes from a source which entitles it to great weight. It had begun to look as though the pension sharks were to meet with no opposition in their raid upon the Treasury, but Gen. Boynton's manly and earnest protest should serve as a rallying-cry for all those who do not want to see the honor of the Union soldier entirely obscured—all the more since the appointment of Corporal Tanner to be Commissioner of Pensions.

THE NORTHWEST RAILWAY SITUATION.

Under reductions begun by the Chicago, Burlington and Northern Railroad, the old flour and grain rate of 7½ cents per 100 pounds between Minneapolis and Chicago, which was raised to 12½ cents by great efforts last fall, seems likely to be reëstablished. It is unfortunate for the effect upon the investor's mind that this reduction should have followed so soon upon the completion of the inter-State agreement, and it is therefore pertinent to inquire how far the Chicago, Burlington and Northern was justified in its action. In spite of the doubt as to the class to which the Soo Line should be assigned in any grouping of competitors; in spite of the fact that it is in part a rival of the Lake Shore, Michigan Central, and other roads of the Central Traffic Association, it also in part belongs geographically to the group of roads running south from St. Paul and Minneapolis. It was probably a mistaken policy which did not arrange to include this road and the St. Paul and Duluth under the presidents' agreement in some form, for the Minneapolis and Sault Ste. Marie was built by Minneapolis millers for the express purpose of providing an independent outlet for flour, and thus preventing a combination of the Minneapolis-Chicago roads to raise the rate on that traffic—in short, to frustrate the very plan and object for which the presidents' agreement was made. In railroading, as in all other branches of trade, the one competitor settles the pace for all the rest.

But there is one factor more powerful than the Soo Line which must soon determine the question of Minneapolis rates, and that is the open lake. It is a fact, all-important in any study of the railroad situation in the Northwest, that Duluth during navigation is as near New York as is Chicago, and that flour or grain can be and is carried at the same tariff from Duluth to Buffalo as from Chicago to Buffalo. If we remember that Minneapolis is 150 miles from Duluth, we are prepared to understand why the flour rate for those 150 miles is the maximum rate which can be obtained on through shipments from Minneapolis to Chicago, three times the distance. Hence we see the reason of the great pressure brought to bear upon the St. Paul and Duluth Road last year to advance its rates to the head of Lake Superior, a pressure which the millers, mindful of fixed Liverpool values and of the necessity of cheapest transportation for any profit on export sales, succeeded in resisting. The position of Duluth is not always correctly understood as regards transportation interests. We think of that city as far away from Nebraska, for example, but in truth the distance from Omaha to Duluth is almost exactly the same as from Omaha to Chicago; and of all that great wheat country lying north of Nebraska and Iowa, Duluth is the natural geographical water outlet. It is only a question of time when these conditions will assert themselves, and as the currents of trade flow from the interior to Duluth and to Chicago, the roads between will find it hard to secure competitive traffic at high rates, though increased local business then may take its place.

There is another complication in the problem, the milling-in-transit question. This has many ramifications, but the principle can be briefly stated. It is conceded by all railroads that Minneapolis as a milling centre is supreme. Tariffs must take this into account. If all wheat-carrying roads terminated there, and all flour-carrying roads led from that city, it would be easy to arrange the matter; but the road which brings in the wheat and can carry out the flour, feels, rightly and naturally enough, that the flour belongs to it. The Chicago, Milwaukee and St. Paul has lines into fine wheat districts. The rate from a wheat station to Chicago is, we will say, 20 cents per 100 pounds, and from this station to Minneapolis it is 12½c. The agreed rate meanwhile from Minneapolis to Chicago is 12½, making a total of 25 cents to Chicago if the wheat was stopped in Minneapolis, ground, and reshipped in the regular way. But the road with feeders grants permission to have the wheat milled en route and reforwarded as flour at the old through rate of twenty cents. It is evident that this saving of five cents per hundred will secure to this road as flour through to Chicago every car of grain which it brings into Minneapolis; and a railroad like the Burlington and Northern, which is dependent upon traffic from Minneapolis straight, and has no branch feeders, will get nothing unless it makes from Minneapolis to Chicago the same rate as its neighbor's proportion of the through rate from the wheat field, which in the case mentioned is the difference between 20 and 12½, or 7½c. per 100 pounds. In addition to this stop-over freight, the milling-in-transit road thinks itself entitled also to a fair share of the "free" grain and flour, for which it hopes to receive the higher 12½-cent rate, a total which the non-transit roads generally think much more than belongs to it. A plan to harmonize these differences was thought out by which the transit road was to redeem its orders when carried by other lines at a certain price, but the old difficulty crops out continually.

To show where this "free" grain comes from, and in general to give a clearer idea of the situation, we present the figures below, taken from the report of the Minneapolis Chamber of Commerce for 1888:

Statement of flour and grain received at Minneapolis and shipped out in 1888:

Railroads.	Am't rec'd in bushels, flour being reduced to wheat.	Shipped out.	
		Flour, No. of bbls.	Wheat, & flour reduced to wheat, in bush.
C. M. & St. P.....	9,317,485	1,111,005	13,150,030
Omaha..... (C. & N. W)	4,669,505	954,771	5,612,780
Minn. & St. Louis.. (Rock Island)	2,210,382	242,909	1,410,360
Wis. Central.....	1,778	184,500	1,171,530
Manitoba	21,538,735	112,615	879,528
St. Paul & Duluth..	71,730	856,520	3,925,020
No. Pacific.....	5,450,812	4,727	42,282
Chic. St. P. & Kas. City	111,135	865,688	4,749,810
C. B. & N.....	11,437	1,512,198	7,356,370
Minn. & Pacific..	509,010	245	29,030
Soo	975,593	931,502	4,309,370
	44,867,600	6,776,680	42,636,100

The excess of wheat over flour shipments on the Chicago, Minneapolis and St. Paul can be best explained by saying that the wheat probably went to supply local millers, not much of it being exported. The above figures of course include local as well as

through shipments. The strong hold of the Chicago, Burlington and Northern upon the flour traffic is strikingly shown, while nearly all the south-bound lines show an increase of shipments out over supplies in. The great supply of wheat, one-half of the entire receipts, is brought into Minneapolis by the Manitoba, one of the largest wheat-carrying roads of the world. Heretofore this railway has been content with carrying the grain in; lately, however, the company has completed a line of its own from Minneapolis to Duluth, and thus holds the balance of power. It is known that its president is very aggressive, and already there is railroad gossip that a milling-in-transit plan has been talked over to secure for its line out to Duluth a goodly share of the large wheat shipments carried into Minneapolis. The danger of such a system, if put in force on the Manitoba, to the Minneapolis-Chicago roads would be extreme; it would at once put in doubt one-half of the free supplies of wheat which as flour they have been carrying South. Fortunately, other considerations work against the adoption of the plan by that company.

If this be a true statement of the situation in the Northwest, if the competition of the Soo Line and of the lakes must be taken into account, and if milling-in-transit complications threaten all attempts at peace and high tariffs, it would seem to follow that large net earnings between Minneapolis and Chicago on through freight must be problematical for the future. Under the present system of tariff-making, the local rates fall with the through, but this may not always be so. A through-shipment from Minneapolis to New York could be taken at a proportion to Chicago less than the local rate. All through-shipments could be so taken, but are not, for that would ruin Chicago's commission trade in Northwest grain and flour. If any fact stands out prominently in our Western railroad history, it is the fact that Chicago can bend all tariffs and rates to her own needs, no matter what the consequences may be. This is certainly true of the past. Whether it will be true for the future, no one can say.

THE REASONS FOR PRIVATE LAND-OWNERSHIP.

Our article on Henry George's land theories has called forth many letters of protest—so many that we have not sufficient space to publish them. We are accused of unfairness in two points: first, in misstating Henry George's position; and, second, in drawing some inferences from Mr. Cowen's facts about Maryland's oyster-beds which were a little different from those of Mr. Cowen himself. To the second charge we plead guilty. Our inferences did go somewhat further than Mr. Cowen's. That was why we made an article of our own, instead of quoting part of his. But the other and more serious charge, of misstating George's position, we deny *in toto*. We believe that the misunderstanding is on the part of our critics rather than ourselves.

We have received more than one letter containing phrases like this: "Your article on the single-tax theory, or Henry George's land theory, as you prefer to call it." Now we did *not* publish an article on the single-tax theory; and we do *not* prefer to call it the Henry George land theory. We much prefer to call each by its own name. We believe that the confusion between the two has resulted in great mischief. The single-tax idea involves a practical proposition which deserves most serious consideration, and which, within limits at any rate, has a great deal to be said in its favor. The Henry George land theory is an historical generalization which is all but wholly false. The attempt to support a partially true idea by false history involves hopeless confusion.

The Henry George land theory may be stated as follows:

> "Historically, as ethically, private property in land is robbery. It nowhere springs from contract; it can nowhere be traced to perceptions of justice or expediency; it has everywhere had its birth in war and conquest, and in the selfish use which the cunning have made of superstition and law" ('Progress and Poverty,' p. 333).

If this were a true statement of the case—if private property in land were a purely arbitrary institution, the result of force rather than expediency—then each industrial abuse which arises under the present system would furnish at least a prima-facie ground for its total abolition. But this statement is not true. As we showed in our previous article, private property in land has been gradually adopted as being the only way of securing the investment of capital for the sake of remote returns. Under any other system the land was exhausted. Where all agriculture was rude, common ownership could prevail. As improved methods were adopted, the law adapted itself to new technical conditions. The community which did not thus change fell behind in the industrial race. Private property in land, instead of producing the evils of over-population which George charges upon it, postponed the appearance of those evils, by enabling a system to be adopted which would support a larger population with less labor than under the old.

The history of agricultural land tenure repeated itself in mining law. Where the miners roamed from place to place, like tribes in the nomadic state, no rights to land were recognized other than the right of occupancy. When matters had so developed that capital was needed for mining, laws were adopted protecting land tenure. The same process is repeating itself in the matter of oyster culture. As between the two systems which have been actually tried—common use and private ownership—the latter has given far the best results for the community as well as the individual owners. So marked has the constant repetition of this history become that Prof. Wagner of Berlin, after a most careful examination of the whole subject, declares that "the argument against any absolute right of private land-ownership becomes a strong justification of such ownership relatively to present conditions." He also takes pains to say that it is for the sake of the community as a whole, and not for the landowners alone, that the system has proved necessary. And these are not the words of an "orthodox" economist, but of one who is called a Socialist in many quarters.

It must be admitted that the distribution of land under the present system is, in many cases, the result of force and fraud. But the system itself is not. To confuse the two things is a serious fallacy. Any practical inferences which might be drawn under such a confusion would almost certainly be bad. It would be like refusing to arm soldiers with breech-loading rifles, for fear they might fire away their ammunition too rapidly. We are quite willing to admit that a better system than the present one is conceivable. Anything which should give the same incentive to improvements that exists at present, and at the same time avoid the abuses under which we suffer, would be a great advance. A reform which should take burdens off from invested capital and transfer them to the owners of ground rent would be a desirable one. But we believe that the proposal of the more radical single-tax men would do vastly more harm than good.

In the first place, it is not quite true that the security for improvements, even if realized, would be as great an incentive to the owner as the right to the land itself. The "magic of property" is a somewhat indefinable economic factor, but it is none the less a real one.

Second, and far more important, we do not believe that the proposed security for improvements could be made full or complete. The practical alternative in the past has been insecure tenure or direct ownership. We have no doubt that George and his followers sincerely believe that a middle course is possible; but the failure to carry it out in practice is most conspicuous. The various instances cited by Henry George, as showing private ownership to be unnecessary, are cases where improvements were not made on the scale demanded by modern civilization; cases where people could be content to support a smaller population in a ruder state.

George's idea is, that the assessors should tax ground rent 100 per cent., and leave improvements untaxed. But what board of assessors could be trusted to determine where the value of land ended, and where that of improvements began? Any man would be afraid to put too much capital into his land on such terms. If his investment proved less wise than was expected, he would have to bear the whole loss; if it proved wiser, he would enjoy none of the gain. The greater the wisdom with which a man had managed such property, the less protection would he have against the arbitrary action of the assessors in depriving him of the fruit of his good management. If it were the duty of the State to take the whole rent, everybody would be shy of giving it the power to take too much. Any theoretical security for improvements would be practically insecure.

But there is still another and perhaps deeper difficulty. A sudden reversal of precedent, which takes away the security for property of one kind, reacts upon security of every other kind. If people suddenly destroy land titles in obedience to the theo-

ries of Henry George, why will they not abolish other titles in obedience to the theories of Proudhon? If one form of property can be confiscated, the practical guarantees for the safety of other forms of property are greatly weakened. The insecurity thus created is a destructive force of tremendous moment.

When George says, "We should satisfy the law of justice, we should meet all economic requirements, by at one stroke abolishing all private titles, declaring all land public property, and letting it out to the highest bidders in lots to suit, under such conditions as would sacredly guard the private right to improvements," we are reminded of a recent piece of railroad legislation in one of our States. A law had been passed looking towards decided reductions in rates and fares. It was feared that the effect of this law would be such as to hinder the investment of new capital for building railroads in the State; and to avoid this unpleasant contingency, it was provided that this act should not apply to any railroad hereafter to be constructed. The attempt to confiscate rent and hold improvements sacred has a little more theoretical justification than the attempt to confiscate old railroads and hold new ones sacred; but we do not believe that investors would place much reliance on the promised distinction in either case.

LAWYERS IN POLITICS.

The trouble in which Sir Richard Webster, one of the ablest lawyers at the English bar, has got himself in the Parnell case is one of the natural results of the general confidence felt in his party that the *Times's* charges were going to kill the Irish question as a disturbing element in English politics. When the *Times* brought out the forged letters, with an air of triumph, it not only made the passage of the Coercion Bill very easy, but seemed to insure the complete disgrace and political destruction of the Irish leaders. Sir Richard Webster, therefore, when he took the *Times* brief, was doubtless carried away by the political considerations which often govern great lawyers in the conduct of politico-legal trials. It is not possible, in fact, for a counsel in such cases as Horne Tooke's, or Queen Caroline's, or Peltier's, or O'Connell's, to live within the four corners of his brief, and take simply a professional interest in the proceedings. He becomes, in spite of himself, the champion of the political party whose fortunes are to be affected by the result, is thrilled by their indignation and inspired by their hopes, and feels as if their future was dependent on his exertions. People understand all this, and are not displeased by it. Sir Charles Russell, an Irishman and an ardent Home-Ruler, for instance, has brought a good deal of heat into the conduct of the defence, and has more than once shocked the judges' sense of decorum by the vigor of his language, but he has not shocked or surprised the British public. They know that he in this trial stands for his party, and has to bear the burden of far graver responsibilities than the guilt or innocence of Parnell or his individual followers. People expect a man in such a situation to glow with something higher than professional ardor; they are disappointed and even disgusted if the man does not under such circumstances get the better of the lawyer.

What has brought Sir Richard Webster to grief, therefore, is not that, although a Government lawyer, he took the *Times's* brief, and not that, having taken it, he brought some of the passion of a politician to the conduct of the case, but that, after he had taken the brief, with a full appreciation of its exceptional political importance, he either wilfully neglected to go to the bottom of the *Times's* case and find out on what it rested, or did go to the bottom of it, discovered its weakness, and trusted to luck to keep the knowledge of it from the defendants. In either case, they say, his conduct was "unprofessional," to use a mild word. His speeches in Parliament before the trial and in the O'Donnell case indicated that he fully believed in the authenticity of the letters, and was not unwilling that the expression of this belief should influence public opinion against the Parnellites. But people ask with amazement, Was it possible that in a case of this magnitude a counsel of Sir Richard's standing kept his eyes fixed on his brief, as if he were trying a horse case, and never asked Soames, the attorney, and Walter, the plaintiff, where they got these letters, or whether they had any reason for believing them genuine except the resemblance of the signatures? Or, if he did ask them, and they told him, is it possible that he neither made nor suggested any inquiries as to Pigott's character? And, finally, what did he mean by calling Pigott on the trial, when he had had for a week in his possession a letter from Pigott to Soames warning him that he could not stand cross-examination? This letter—seeing the terrible nature of the exposure—Sir Richard said in the House of Commons when attacked, that he had communicated five days before Pigott was called, to Parnell's counsel. He had, on Monday last, in the presence of their indignant denials, to confess that he was mistaken; that he and Soames had kept it to themselves, and had produced Pigott just the same, hoping, doubtless, that he would somehow pull through.

We cannot recall a more lamentable situation than that in which this confession places him. It has given the Liberals fair justification for tearing him to pieces, but it has also furnished one of the most curious illustrations on record of the professional solidarity of the bar. There are in the present House of Commons seventy-three barristers and twenty-two solicitors, probably about equally divided between the parties—that is to say, about fifty are Liberals. When the division was ordered the other night on the motion to reduce the Attorney-General's salary, by way of censure, twenty Liberal lawyers walked out of the House before the vote. Had they remained they would have reduced the Government majority to forty-six, the lowest point it has yet reached, and the moral effect would have been very great. But they followed the immemorial custom of the bar in standing by a brother lawyer in trouble—a custom over which the public has vainly grumbled for twenty centuries. There is no other calling in which the *esprit de corps* is so strong, in which professional jealousy so rarely finds outward expression. Doctors are very faithful to each other, but their quarrels are numerous and savage. Clerical bickerings, too, are very bitter and not infrequent, and soldiers and sailors are by no means unwilling to use the knife of criticism on each other. But "brother lawyers" seldom fail each other in times of danger, necessity, and tribulation. The effect of this last display of fidelity on the English voters is said, however, to be very unfavorable to the future prospects of legal candidates for Parliament.

FRANKLIN'S ARTICLES OF CONFEDERATION.

Washington, March 20, 1889.

It has been a somewhat puzzling question to historical students, how Franklin's proposition for a confederation of the colonies was received by the Continental Congress in 1775. The journals of the Congress, carelessly kept and more carelessly printed, contain no mention of such a proposition. Though "bro't in by committee," as an endorsement shows, no committee was appointed to draft one, no formal report was made upon it when submitted, and no correspondence of the day contains mention of any debate upon the proposals. It was, to all appearances, the individual act of Franklin, informally performed, and the treatment of it by Congress proved how little support it could count upon. Mr. Bancroft merely notes that the proposition was, "for the time, put aside"; and Mr. Bigelow, in his edition of Franklin, says: "What proceedings were had to them cannot be ascertained from the journals; but it is probable that after some debate they were referred to a committee." In his correspondence Franklin makes no mention of his original proposition or its fate, and does not appear to have given it a second thought—an omission suggestive, perhaps, of the determined and convincing opposition on the part of Congress. Even the historical rake of Peter Force—and a very fine-toothed rake it was—did not discover any facts respecting the inception, framing, submission, and final postponement of this plan of union; and, but for the existence of the original manuscript of the articles in the collections of the Department of State at Washington, it might with good reason be doubted if such a scheme had been laid before Congress.

Important as was the intention of Franklin, and original and sweeping as his plan must have seemed to a body but barely launched upon the sea of rebellion, it is curious that so little impression was made upon the members. Had it met with the approval of a majority in Congress, or had it given occasion to a marked difference of opinion, it would have been alluded to in some of the letters that the delegates wrote to the colonial governments, many of which have come to us and form the best source of information on the acts and debates of the Congress. Meagre as are these records, an act of union would surely deserve mention, as a year later the Declaration of Independence was widely discussed while pending before Congress, and, subsequently, the Articles of

Confederation that were based upon the earlier propositions of Franklin.

In looking over a very imperfect file of one of the rarest of colonial newspapers, the *Virginia Gazette*, my attention was attracted by an extract of a letter printed in its columns, as was usual at that time, without names, but containing every evidence of undoubted authenticity :

Extract of a letter from a gentleman in Philadelphia to his friend in this city [Williamsburg], dated November 24.

"The confederation is an article mentioned in your letter. Let me give you a state of that matter: in the last congress it was observed by a gentleman, with whose extensive knowledge and abilities the world is well acquainted [*i. e.*, Benjamin Franklin], that when we set out originally upon the plan of a commercial opposition, an instrument was formed by which the colonies were bound to stand by one another till certain ends were obtained. This was the association; that Great Britain had now rendered an opposition by arms necessary, in which case he thought there should be also some bond of union, in writing, that each colony might know how far it had a right to rely on its sister colonies. He therefore introduced a form of confederation to be moulded into any shape thought proper, and merely to set the thing a-going. I do not recollect whether it was read or not, but I well remember that the congress refused to enter into any consideration of it, to send it to the conventions for their approbation, to have it printed for public perusal, to have any entry made in their journals of such a paper being offered, or in any manner to make any order which should imply either approbation or disapprobation of it; it was simply permitted to lie on the table, from which it followed, that if gentlemen thought proper to say anything about it afterwards, it was to be on their own authority individually, and not as proceeding by the order, or even the desire, of congress. Since this, not a word has ever passed in congress upon it, nor had we heard anything without doors till Mr. Inglis informed us such a paper had been solemnly laid before a neighboring convention for them to say whether they would accede to or reject it in the lump, it being said that the alteration or diminution even of a letter would not be admitted; that in the lump they chose to decline it; and that the thing began to make some noise in Virginia. This is the whole I know of it. Though I might not approve of the confederation proposed, perhaps, as it stood (for really I do not remember what it was), yet I am ready openly to declare to the world it is my opinion we ought to be bound together by some treaty of alliance, or confederacy, in which the objects of the war should be defined, the terms of closing it delineated, and the colonies of the union bound to each other to contribute their respective force to obtain these objects, and when these objects were attained, that any one colony should have a right to say they would go no farther." (*Virginia Gazette*, December 13, 1775.)

This letter throws not a little side light upon what has been already published. John Adams, whose sense of self-importance fortunately led him to keep a note-book of the events passing before him, came to the second Congress full of ideas of independence and a union of the colonies—independence of the mother country and a union among themselves. From conversations with the delegates of other colonies, he became convinced that such was the "general sense at least of a considerable majority of that body," and an opportunity for urging his views soon presented itself. Congress assembled on May 10, 1775, and, after a few days spent in organization, was at once confronted with the perplexing question of what the individual colonies should do for themselves, and what might be expected from a general control. For up to this time the Eastern colonies had monopolized attention as the centre of action. It was a New England army before Boston, commanded by provincial officers, and not subject to the direction of Congress. New York applied for "advice" how to "conduct themselves with regard to the troops expected there." That was but an example of what was asked of the Congress, for the inefficiency of the provincial generals before Boston called loudly for a change, and this change the Provincial Congress was only too willing to lay upon the Continental Congress.

With such responsibilities before it, it was a perfectly logical step to regard the possibilities of a more complete union than was then afforded by the Congress acting as a Revolutionary body and meeting the emergencies as they arose. Adams's ideas would thus be received with favor, and were in a measure adopted. The army before Boston was made a Continental army under Continental pay, control, and officers. A Continental treasury was constituted, Continental paper money issued, and in many other ways a spirit of union was manifested. But all this was done without any formal declaration of an independence of British control; and a spirit of moderation, a desire to temporize in the hope of a peaceable reconciliation with the mother country, more than any other single factor, led to the postponement of what should have been the first steps—a declaration of independence, a form of confederation and free ports, according to some such plan as Franklin's propositions embodied. This peace-at-any-price party of that day (and John Dickinson was one of its leaders) received its support chiefly from the Middle and Southern colonies, the New Englanders being the "radicals"; and its strength was sufficient to defeat the measures that were so urgently pressed by Adams.

It was very natural that Franklin should have presented a plan for a confederation. His experience in the Congress of 1754 proved his earnest desire to bring about a union, and his moderation and popular esteem made him a fitting instrument to overcome the opposition of the Dickinson party. Adams had had a sharp altercation with Dickinson, and had very likely gone to Franklin to enlist his aid against his (Franklin's) colleague. At all events, the letter we have just quoted lends a new interest to Adams's noted letter against Dickinson—the "certain great fortune and piddling genius, whose fame has been trumpeted so loudly, has given a silly cast to our whole doings." Congress ought to have had in its hands "a month ago, the whole legislative, executive, and judicial of the whole continent, and have completely modelled a constitution." This was written on July 24, or three days after the Franklin articles had been tabled, and postponed, according to all appearances, through the efforts of the Dickinson party.

It will be curious to know how the draft of these articles, without having received the endorsement of Congress, was submitted to the local legislatures of the respective colonies. The writer of the letter speaks of its solemn submission to a "neighboring convention," and the fact that the draft is printed in the New Jersey archives (vol. x. p. 691), leads me to believe that New Jersey was the "neighboring" colony. This conjecture is further supported by the fact that Charles Inglis, A.M., was one of the signers of the "Address of a Committee of the Church of England in New York and New Jersey to Secretary Hillsborough, relative to the distressed state of the Church in those parts, through the want of Bishops," and probably was from New Jersey. This is, of course, only conjecture, as "Mr. Inglis" is too indefinite a description to pin a positive statement upon. Was the draft sent to any other colony? That it should "make some noise in Virginia" may show that it was sent there also, or had been printed in one of the *Gazettes*.

Fortunately, from an English source, we are able in a manner to trace the matter a little further, and in so doing to add a proof of the authenticity of the letter from the *Virginia Gazette*. The writer of that letter speaks of the individual authority of the members (*responsibility* would have been a better term) for any action on the proposition. The delegates from South Carolina sent it to the Provincial Congress with the following letter:

"The Provincial Congress are to view the following articles as a subject which will be proposed to the Continental Congress at their next session; it therefore becomes the duty of the Provincial Delegates now assembled, to instruct the gentlemen whom they shall make choice of to represent them in the next Continental Congress what they are to express to be the sense of this province. The former delegates beg that this plan may be considered, not as having had the sanction of the Continental Congress, or as recommended by them, or as expressing the sentiments of the Delegates who represented this province in the last Continental Congress, but wish they may be dispassionately debated, and approved or condemned upon their own intrinsic merit."

Unfortunately, the letter is without date or signatures, and may have been a mere circular addressed to all the local legislative bodies. It was accompanied by the articles as prepared by Franklin, and was probably intercepted by the British.

One further step can be given. The proposition was laid before the Provincial Congress, sitting at Hillsborough, on August 21, as a "paper purporting a confederation of the united colonies," and after some debate the following resolution was framed:

"That the committee [of the whole House] have taken into consideration the plan of general confederation between the United Colonies, and are of opinion that the same is not at present eligible; and it is also the opinion of the Committee that the delegates of this province ought to be instructed not to consent to any plan of confederation which may be offered in an ensuing Congress, until the same shall be laid before and approved by the Provincial Congress. That the present association ought to be further relied on for bringing about a reconciliation with the parent State, and a further confederacy ought only to be adopted in case of the last necessity."

It may not be useless to add a word of conjecture as to the author of the letter. The Virginia delegates to the Congress of 1775 were: Peyton Randolph, George Washington, Patrick Henry, Richard Henry Lee, Edmund Pendleton, Benjamin Harrison, and Richard Bland. The writer of the letter must have been in Congress in July, when the Franklin propositions were submitted, and probably in November, when the letter was written. Randolph retired in May and died in October, Jefferson being elected in his place. Washington was out of Congress when the articles were submitted, Henry was not reëlected, and Bland and Pendleton had both resigned before the end of August. Lee and Harrison were thus the only two members of the delegation of Virginia who were present at both dates. Lee was quite as much of a "radical" as Adams, and would probably have felt the postponement of the scheme in July with sufficient force to have recalled the circumstances attending its reading—for it was read when presented, as an endorsement by Charles Thomson, the Secretary of the Congress, proves—more definitely than the writer. This leaves only Harrison, a man of known moderation that oftentimes amounted almost to indifference. When Harrison soon after visited the camp with Lynch and Franklin, he was shocked by the extreme democratic views he heard expressed; and General Charles Lee, who never hesitated to blurt out the truth, and could never be accounted a conservative in any direction, made his (Harrison's) surprise the text of a letter to Benjamin Rush,

warning him to repress his extreme sentiments, as unacceptable to the Southern colonies. The matter possesses some interest, and it is to be hoped some of your readers will be able to throw more light upon it.

WORTHINGTON C. FORD.

A DAY IN ALTENBURG.

LEIPZIG, February 21, 1889.

THE rain was just beginning to fall as I stepped out of the railway carriage at the Altenburg station, and my first care was to inquire when there would come a train to carry me back to Leipzig. Having ascertained this, I took a hasty observation from the station platform, and, seeing nothing remarkable on either hand, determined to follow my fellow-passengers, who were moving off all in the same direction. The feeling of agreeable anticipation that usually accompanies setting foot for the first time in a new place was considerably blunted by this wet reception. When I left Leipzig, an hour before, the sun was shining brightly, and, in spite of the season of the year, there was scarcely a touch of winter in the air. Fortunately, I had brought an umbrella, and, armed with this, I made up my mind to do my sight-seeing in spite of the rain, and get back to Leipzig before evening.

Five minutes' walk, followed strictly in the wake of my car-companions, brought me into full view of the bold rock upon which is built—so fitly that it seems only a natural development of the rock itself—the Schloss of the Dukes of Sachsen-Altenburg. In the hollow at its base, and up the slope of the hillside opposite, lay the old town, a collection of picturesquely distorted old houses, enclosing several church-spires in their midst, and here and there leaving space for a larger building of modern erection. The red tiles on the high-peaked roofs shone through the moist atmosphere with that soft effect so easily reproducible in a water-color. As far as they were concerned, it would have been a pity to have the sun shine. Red tiles look incomparably better in the wet.

Comforting myself with this reflection, I continued along what was evidently the "main street" of this portion of the town, and, after turning a short curve following the outline of the hill, found myself at the driveway entrance to the Schloss. A stately road, very brown when I saw it, with recent gravel, winds up the side of the cliff, fringed by a low stone wall that gives it finish and an even edge against the sky. Two old stone gate-posts, placed in face of the town several feet above where the ground begins to rise, add that imposing something which gate-posts seldom fail to lend a road. In ordinary cases, one accepts them as a sort of guarantee that the road leads somewhere worth going to; they convey a promise and announce a patronage. In this case, where no such guarantee is needed, one having only to look up to see the obvious goal of the journey, they might seem superfluous; but, whether from the association of habit or some other cause, here too they add distinctly to the imposing effect. The effect was inviting as well as imposing, and as I began the ascent, I half expected to gain a region above the level of the rain clouds, where sight-seeing would be made easier. The celerity of my approach, however, proved conclusively the extravagance of such hopes; the elevation, though abrupt, being really very slight. I paused a moment where the road bent, almost doubling on itself, and looked down through the rain on the old town. Altenburg, I have read, is mentioned in a manuscript as old as 980; and though it contains at the present day assuredly no monuments of so early a period, it did not seem so wildly improbable that some of the mustiest of the old houses had originated in the rebuilding that followed the burning of the town by the Hussites in 1430. I say the "mustiest" advisedly, for if there be any specimens of this period still extant, they must, by measure of their solidity, be less picturesque than the more slender and toppling structures, enriched with quaint gables and lattices and striped with cross-timbers, of later erection. Of this latter description are the great majority of Altenburg houses, and where they exist, the view—to American eyes—must always be an interesting one.

The road enters the castle-yard under a square tower which has stood since some time in the eleventh century. Nothing else about this tower is particularly calculated to arouse enthusiasm, and even in respect to age it is surpassed by another tower, this one round, which stands detached on the highest ground of the court, and is alleged to date from the eighth century. From the top of this, one can see (when the rain permits) all the country around, and the approach of all the foes of Altenburg in times past has, without doubt, been heralded from its lookout windows. The various buildings composing the Schloss join hands in an irregular ring about this tower; those to the rear of it being the humble quarters of retainers and the guard of soldiery. A sunken place about in the middle of the court contains a not very limpid pool intended for the watering of horses. On a shaft rising out of the water stands a little old-fashioned stone image of the god Poseidon, trident in hand, who looks, as far as one can make out his expression, thankful to be so safely removed from the muddy element below him. The main building of the Schloss is quite a plain, barrack-like structure, which, on account of its mass, makes a good effect when seen from below, but is uninteresting on closer inspection. The part occupied by the ducal family is all new, the Schloss with the grand *Saal* having been burned in 1864. Not a soul was in sight while I made my observations, save the sentinel at the gateway, and he had retired to a corner sheltered from the rain. I made up my mind to follow his example, but walked first towards the residential portion of the Schloss to have a look at a three-tiered gallery that decorated one of the walls in striking incongruity with the prevailing style of architecture. As I passed by the windows of the ground-floor, an individual in the uniform of an army officer jumped up from his seat, and, advancing to the casement, continued to observe me as long as I remained, with an interest that I could not but consider flattering. Already on climbing the road to the castle, I had remarked, fluttering over the wing nearest the town, the tiny green and white flag that announced the presence of the Duke in his "ancestral halls." Was it possible that his Highness found it so dull on this rainy day that the passing of a casual stranger assumed for him an altogether disproportional interest?

The salvation of Germany on a wet day lies in her cafés. There is hardly any place so small as not to contain a more or less agreeable retreat where excellent beer or passable chocolate, and that national institution the *Fliegende Blätter*, may be obtained. In all but the largest cities, some of the tables scattered about the main room of such an establishment are pretty sure to be occupied at almost any time of day by groups of smokers or card-players, whose utter indifference to the passage of time inspires one with the most delightful idea of the nature of their employment in life. The atmosphere of these places is at all times quiet and civilizing, and they are, for the interested stranger, excellent corners from which to observe particular types and national characteristics. It was with the ideal of such a sheltering corner before my eyes that I came down from the castle into the town again, without having made an attempt to see the interior of the court chapel, of which the long windows and slender spire formed one of the best "bits" in the view of the big pile from below. This I made up my mind to see later in the day, on the occasion of a second visit, when, it was to be hoped, I should be somewhat drier and the weather would have improved. In the meantime, without having to go far on the narrow little street that led up the opposite hillside, I found the place I was seeking. It was literally a corner—a corner room as well as a corner house—and the surroundings were quite as I had foreseen, from the group of interested card-players to the last number of the *Fliegende Blätter* lying open on the table. It was pleasant to be received with a bow and greeting from the affable proprietor, pleasanter still to feel the genial warmth of the great German stove, and yet pleasanter to turn over the *Fliegende Blätter* with one hand, while retaining with the other hold of a cup of steaming hot chocolate. Agreeable, too, when heard from this point of vantage, was the sound of falling rain on the windows, so that one could give up thinking about the weather, or even be willing to have it grow worse. The landlord shifted his seat from table to table, so as to slight none of his customers, and now and then hurried out to give an order, or rose to welcome newcomers. The group of card-players kept steadily on with their game, which appeared to be one of the complicated order—possibly *Skat*, which is so difficult that few Germans play it correctly—and only looked about them when their emptied glasses made it desirable to give a hint to the waiter. Almost every one smoked, and the newspapers of Leipzig and Berlin found a wide circulation; in Germany no one buys a single paper, but goes to a café, where, for the same expense, he can read them all. The whole scene possessed in an eminent degree that quality expressed by the German *Gemüthlichkeit*; there is an English equivalent for the thing, but none for the word.

Comfortable as the thing was, this was not seeing Altenburg, and as the afternoon advanced and the rain continued to fall with gentle insistence, there seemed nothing for it but to start out for another tramp in the wet. This time I walked away from the castle, intending to reach it again in a long circuit through the crooked little town. A few steps from my place of shelter brought me out before a pretty church, more in the English style than any other I had seen in Germany. It had been rebuilt rather than restored (I know not whether in the original style), and looked completely new. The door yielding to my pressure, I walked in, and found the interior even more English than the outside; some dim pictures and tablets, with Old German inscriptions, exposed on the walls of the vestibule, were the only signs of antiquity. After this my walk resolved itself into a chase after towers; new ones were continually revealing themselves to me, and then disappearing again before I could trace them to any foundation in the soil. It seemed as if the streets had been contrived with the subtle purpose of screening these towers from the intrusion of the indiscreet transatlantic visitor. Many of them were large enough to be connected with very capacious churches, yet the disposition of the streets

about them made it necessary to give up the supposition that such existed. In the course of a long pursuit of these architectural enigmas, I learned that it was perfectly possible to see a tower at the end of a certain street and on turning into that street to find none there. Two brick towers in particular, rising side by side to a considerable height, baffled my endeavors for upwards of half an hour. In America two such towers could exist only for the purpose of indicating a "sacred edifice" somewhere immediately below them; what they indicate in Germany I am unable to say, for after finally coming within a stone's throw of them, I found further approach prevented by a guard of small houses clumped defensively about their base. A flight of stone steps leading to a street on a higher level permitted me to get even closer, but there all trail ceased, and one was obliged to conclude that access to the towers, to all but winged creatures, was denied. The one fine tower which it is easy to approach is that of the pretty Renaissance *Rathhaus*, which stands on the principal square, or market-place, of the town. Here are also some quaint little houses, one of which, having the motto "Verbum Domini timeo" (if I have remembered it aright) carved over the doorway, struck me as being just the cottage for Love to reside in, provided his proverbial abode can be conceived of as situated in a small German town instead of in the green country fields where it belongs.

As I walked back in the direction of the Schloss, my eye was attracted by a handbill announcing that Nicolai's opera "The Merry Wives of Windsor" would be performed that evening at the Ducal Theatre. Curiosity to see the theatre, added to a desire I had already begun to feel to spend a night in this interesting little town, brought me to the hasty conclusion of deferring my return to Leipzig until the next day, when I should have time to visit the Castle in the morning. In order to render this decision irrevocable, I lost no time in purchasing a ticket for the evening's performance. Although willing, on this occasion, to be mildly extravagant, I found myself unable to pay more than a mark and a half, or about thirty-seven cents, for one of the best seats in the house. This was due, of course, to the Duke, whose support of the theatre makes possible the giving of performances at such low prices of admission. It was impossible not to indulge in some quite new reflections on the convenience, in certain cases, of the paternal form of government. There seemed no doubt, at least, that their Duke was a blessing to Altenburgers, for without him they would miss the very tangible advantage of a theatre to go to, besides the less substantial, if no less prized, right to have their town marked with a capital star in the German geographies. The petty German princes have, as every one knows, lost all but the semblance of political power; but the semblance has, after all, a value, and the presence of a court does an immense deal to give an air of distinction to a little provincial city. During the entr'actes, when it is the custom in Germany to promenade in the foyer, I had a chance to catch a glimpse of Altenburg's first society. Its most considerable personages, after the ducal family, seemed to be some officers of rank, whose long uniform coats give their owners as much as possible the figures of spools of cotton. Such a thing as unbending on the part of these individuals is, of course, impossible. A slow walk, allowing a generous clanking of their swords on the uncarpeted floor, and a haughty stare, seemed to suit them best. There was some visiting between the occupants of the boxes, and an interchange of stiff politeness, the frigidity of which may have been the result of the icy atmosphere of the foyer. It seemed to me that that cold foyer, those stiff positions and frozen bows, gave no inadequate idea of the *tristesse* that must pervade a society in which the courtly forms remain when the spirit that created them has disappeared. I thought of the melancholy figure at the window of the Schloss, and hastened, with a shudder, to the warmth below. But if these people bore themselves, as they must, it remains true, as I said above, that their presence contributes a kind of distinction that is missing in larger towns in which there is no court to serve as a focus for the general life.

The inn where I passed the night was, I am sure, the most comfortable in all Germany. Its front windows looked out upon an open place about half-way up the side of the hill, and, from behind, one gazed across a forest of broken roof-tops to where the tall Schloss stood outlined against the sky. Everything in this inn was clean and simple, and, to give an idea of its terms, I believe I paid forty cents for my entire residence there—the use of a big square bedroom over night, and very fair coffee in the morning, with white bread, carefully buttered in advance. The morning was fine, and the picture I got of Altenburg in climbing the hill to the Schloss was one in which all the colors that had been represented the day before by shadings of gray, had been restored to their rightful places in the landscape. A ruddy-faced individual in an old coat, who excused himself in order to change it for one of dark green with liberal bindings of gold lace, took me in charge, and under his guidance I made the tour of the Schloss in approved tourist style.

It was the chapel that I most desired to see, and this I found to be really worth the sacrifice (if it could be considered one) of remaining in Altenburg over night. It was originally the church of the Kollegiatstift St. Georg, founded in the year 1413, and is full of exquisite wood and ivory carving of the fifteenth and sixteenth centuries. The altar and the choir-stall are particularly rich, but the whole chapel offers a beautiful example of that carvers' art in which the German Renaissance found one of its first and most national forms of expression. On the wall of the gallery where the ducal family have their pew are two pictures by Lucas Cranach, of whom numerous examples, indeed, are to be found throughout this part of Germany. Adjoining the chapel is a broad hall, from the walls of which the assembled princes of the house, most of them very beefy and unamiable appearing personages, look down upon modern intruders. The names they bear are not great ones, and are often surpassed by those of the artists who painted them. Beyond this hall extend, in a long line, the state apartments of the Schloss, which, as they contain nothing but some very vivid furniture and the expressionless portraits of a great many "Hoheits," it may be permitted to pass over in silence. To pass *through* them in silence is unfortunately not permitted, your guide displaying a fatal eloquence over Serenities whose deeds or misdeeds do not interest you in the least. The great *Saal*, entirely made over since the fire of 1864, comes at the end of the row, and is shown as a sort of "clincher" to the splendors that precede it. It is an apartment of fine dimensions, but the decoration is lacking in warmth, and for this, or some other reason, the general impression is unsatisfactory. In an outlying portion of the Schloss, which one reaches from the court, is shown a collection of ancient armor, old books and china, historical costumes, models of Altenburg buildings, and curiosities in general. Among the latter is a portion of the rope ladder used by Von Kauffungen when he ran away with the little Saxon princes, Ernst and Albert, in 1455. The kidnapper was discovered and promptly brought back, and the young princes lived to be the progenitors of the two lines of the Altenburg house. Over one of the doors in this museum is placed a bust of the present Duke, of which, my guide informed me, his Highness complains that it makes him look like a pig. Unjust as this may be, it is yet true that many of the Duke's photographs invite the same unfortunate comparison.

In glancing over these lines I find I have made no mention of the Altenburg women. Barbarously ungallant as it is to make them the theme of a closing paragraph, they yet deserve attention on account of two peculiarities—their advanced age and picturesque costume. If there be any young women in Altenburg, I failed to meet with them. That all should be old is a matter for particular regret when one comes to consider the advantages of their costume for setting off the attractions of youth. This consists partly of a short petticoat of dark material, reaching to the knees, and made so uncomfortably tight behind as to resemble the blanket wrapped around an Indian squaw. Black stockings and wooden shoes complete the costume in the downward direction, while above the waist the effect is that of a somewhat complicated arrangement of shawls and colored handkerchiefs. The head is left bare, or at most covered over with a bright handkerchief. It may be that this costume is a mark of distinction only to be assumed by women who have arrived at years of discretion. If so, the age of discretion is attained very late in Altenburg, and the distinction it brings is apt to be accompanied by no inconsiderable degree of poverty, most of these old women going about with big baskets or bundles of wood on their backs. Besides, this hypothesis would not account for the apparent absence of young women from Altenburg. Do they all go away to avoid having to wear the costume?

Correspondence.

MR. WANAMAKER'S CAMPAIGN FINANCIERING.

To the Editor of The Nation:

Sir: In the *Nation* of the 14th inst., speaking of the "great scandal" attached to the Harrison Administration by the appointment of Mr. Wanamaker as a member of the Cabinet, you say:

"If we are not greatly mistaken, the case is aggravated by the knowledge which President Harrison now possesses of the circumstances under which Wanamaker tried unsuccessfully to raise $400,000 in the last week of the canvass in this city—circumstances which throw a flood of light on the man's real character."

Would it be out of the way for you to state in the *Nation* those circumstances?

A Reader.

Cincinnati, O., March 20, 1889.

[It would not be out of the way; but then our version would not be so readily accepted as Mr. Wanamaker's own, and we suggest that "A Reader" bring the above extract to the Postmaster-General's attention, adding that the *Nation* will cheerfully publish whatever he chooses to reveal about the transaction in question. As a Christian merchant and politician, he ought to avail

himself gladly of the opportunity. That we may not, however, be accused of evading the call made upon us, we will state that Mr. Wanamaker has been recently asked by letter, by a former Cabinet officer, whether it would be agreeable to him to assist in a public inquiry into the $400,000 "strike," and that no reply has been received.—Ed. Nation.]

THE BALLOT IN NORTH CAROLINA.

To the Editor of The Nation:

Sir: It is somewhat surprising that you should have jumped to the conclusion that because a bill was introduced in the Legislature of North Carolina, proposing to establish an educational qualification for voters, it therefore became a law. As a matter of fact, the new election law of that State contains no educational qualification, that feature of the proposed law having been voted down. Exactly why the Democratic party in North Carolina should have always been so careful of the rights of their political opponents, it is hard to say. Repeatedly they have been in great danger of losing the State, when, by some such perfectly proper restriction as this, they could insure permanent success. The well-known characteristic conservatism of the average North Carolinian is the only reason for such unusual forbearance. No State in the South has suffered more from negro rule than she, owing to the preponderance of the black vote in her eastern counties; yet it has been impossible to induce the Democrats in that State to take any measures to secure their political ascendancy.

Respectfully yours, F. A. Boyle.

St. Simon's Mills, Ga., March 21, 1889.

LAW AND ADMINISTRATION.

To the Editor of The Nation:

Sir: The letter of Mr. Lionberger in your last issue furnishes a curious illustration of the state of mind of most, even of our educated, people with regard to the force of law. If anything is wrong in society or politics, they will make a great stir and great efforts to have a law passed to amend it, and then rest admiringly from their labors. Whether there is any, and if so what, provision for enforcing the law, never seems to trouble them at all. I was once at a town meeting when an old gentleman said that the school committee ought to do so and so. Somebody answered that they didn't and wouldn't do it. Thereupon our man of law quotes from a statute prescribing it as their duty. "But," rejoins the objector, "suppose they don't do it?" "Why, my dear sir, the statute says they *shall* do it." It is an old story of the English magistrate who, after some outrageous ruling, was reminded by his clerk in a whisper that he could not do that. "But you see I *have* done it." On the 22d of April a vote is to be taken in this State upon a constitutional amendment forbidding the manufacture and sale of liquor. The amendment provides that the Legislature shall *enforce* it by appropriate legislation. Whether the Legislature will pass the laws, or whether, if passed, they will be enforced, are points upon which the amendment throws no light whatever, and the uncertainty of which would deprive it of all force. If only to avoid a monumental stultification, it is to be hoped that the people will reject it.

It is just in this strain that Mr. Lionberger quotes a column, and offers to furnish a hundred more, of opinions of our great jurists and decisions of courts limiting the power of legislatures. All these quotations, however, amount to nothing at all by the side of the simple practical question, Have the legislatures exercised and do they exercise power beyond these limits, and if so, does anybody interfere with their exercise of it? One comment which most foreigners make upon the Federal Supreme Court is, that it has no power whatever of enforcing its decrees against Congress.

To me the most remarkable part of Mr. Bryce's book is his analysis of the State governments, the greed of the legislatures for power, and, at the same time, their feebleness and chaotic impotence as against intriguers and the lobby, and, together with this, the weakness and want of coherence in executive administration. How he got at all this I cannot imagine, as I never can find anybody here who seems to have any realizing sense of it. After saying that a European must ask the question, "How can such machinery work?" he goes on:

"In his attempts to penetrate this mystery, our European receives little help from his usually helpful American friends, simply because they do not understand his difficulty. Light dawns on him when he perceives that the executive business of a State is such as not to need any policy (?) in the European sense, and therefore no harmony of view or purpose among those who manage it. Everything in the nature of State policy belongs to the Legislature, and the Legislature alone."

One remark, with which he sums up this topic, seems to me so just, and at the same time so sagacious, that I must quote it:

"What the legislatures of the worst States show is not merely the need for the existence of a sound public opinion—for such a public opinion exists—but the need for methods by which it can be brought into efficient action upon representatives who, if they are left to themselves, and are not individually persons with a sense of honor and a character to lose, will be at least as bad in public life as they are in private."

There is no more pregnant observation in the whole book than this, that our State governments furnish one of the finest fields in the world for political study—a field which, it must be admitted, is at present, as far as the discussion of principles goes, almost entirely fallow.

G. B.

Boston, March 23, 1889.

NEW MEXICAN SPANISH ANTIQUITIES.

To the Editor of The Nation:

Sir: Tourists visiting New Mexico find some interest in the fact that they are freely shown places, as well as edifices, to which considerable age (not to say antiquity) is attributed, by writers as well as by the people of the country in general. It may not be out of place to establish the correct dates of such points and structures, since, in regard to accuracy in this respect, considerable looseness has been and is displayed, in type as well as in words. Thus, Santa Fé is variously stated as having been founded in 1550 and 1583. The Chapel of San Miguel is often reckoned as being over three hundred years old; it is even stated by one writer on the past of New Mexico as being a relic from Coronado's expedition, and as dating, therefore, as far back as 1543, although Coronado (notwithstanding the misstatement made by Castañeda) evacuated the country in the spring of 1542. As to the ruined churches of Pecos, San Diego de Jemez, and others, dates are sometimes assigned to them coeval with, if not preceding, Columbus's discovery of America. As far as I know, Mr. John Gilmary Shea was the first to approach accuracy on the subject of dates of New Mexican Spanish structures.

The first Spanish settlement in New Mexico has completely disappeared from the surface. I doubt very much if excavations, even, would yield any traces of the few buildings that constituted the hamlet of San Gabriel de los Españoles, or Yunqus, on the site where now stands the station of Chanita (Denver and Rio Grande R. R.) opposite the Indian pueblo of San Juan, and about thirty miles north of Santa Fé. That first permanent establishment made by Spaniards on New Mexican soil was founded in 1598, in the months of August and September, and was completely abandoned in 1605. Thence, the Spaniards moved over to the site where Santa Fé now stands, selecting that spot for its central position with respect to the most powerful tribes of sedentary Indians, and also for the reason that there was no (inhabited) pueblo in its neighborhood. The former Tano-village of Oga-P'oge was already in ruins in the sixteenth century. The foundation of Santa Fé, therefore, dates back to the year 1605. It remained the only Spanish town north of Parral (in Chihuahua) until after the uprising of 1680. Only after the reconquest, and in 1695, was the second "villa" founded, Santa Cruz de la Cañada, twenty-five miles north of Santa Fé. Albuquerque dates from 1706. Other settlements are of much later date.

In regard to single edifices, the oldest ones have completely disappeared. Not a vestige is found of the old churches of San Felipe, Santo Domingo, and of the parochial church of Santa Fé, finished about 1627. The first two churches named (both after Indian villages) existed certainly in 1605 and 1607. As to the chapel of San Miguel at Santa Fé, it is posterior to 1636. It was the chapel of the Indian families brought up from Zacatecas, who settled on the south side of the Santa Fé River. Burned down in 1680, it was fully restored only in 1710. The so-called palace stands very nearly on the site of the old one, but its restoration is posterior to 1697.

In 1617 there were eleven churches extant in New Mexico, and some of these may be identified as still extant in ruins. They are: the old church of Pecos, dedicated to "Nuestra Señora de los Angeles," the church of San Diego de Jemez, near the Jemez hot springs, the church of San Joseph de Jemez, reduced, though, to a mere heap of rubbish, five miles north of the pueblo of Jemez. Of the remaining eight, barely the sites are approximately known. The first parochial church of Santa Fé has completely disappeared; so have the churches of San Felipe, Santo Domingo, San Juan, Sandia, Taos, Picuries, and Santa Clara. The churches now in use at the pueblos are all modern, the one of Zia, perhaps, excepted. That of Santa Clara dates from 1760, the church at Zuñi from 1780.

The ruins of churches and chapels in the villages around Zuñi are those of structures reared after 1629. Of still more recent origin are the stately and picturesque edifices, equally deserted, that stand in the ruined pueblos about the salt lagunes of the Manzano, south of Santa Fé. It may be affirmed that the churches of Cuaray, Abó, and of Tabira (erroneously called Gran-Quivira) are the most striking monuments in New Mexico. Built of stone, with walls still erect to a height of from ten to twenty feet, and mostly in a location wild and picturesque, not only have they attracted the attention of the traveller, but considerable of mystic lore has been attached to them and to their environment. Still, their past is well known. Ere I became connected with the Hemenway Southwestern Archæo-

logical Expedition, and while yet travelling under the direction of the Archæological Institute of America, I explored Cuaray, Abó, and Tabirá. Subsequent documentary researches, mostly for the new enterprise above mentioned, have developed the simple story of these forgotten missions. Cuaray (dedicated to the Immaculate Conception) was founded after 1630, Abó and Tabirá between 1630 and 1644. The large church at Tabirá, concerning which so many fabulous stories of hidden treasure, etc., have been circulated, is posterior to the latter date, and it was never finished. All these missions were abandoned about 1670 on account of the Apaches, and have never been reoccupied since. There are also rubbish piles denoting the site of the old church at Tajique, in the same region. The edifice dates from the same period.

It may be asserted that there is in New Mexico no architectural vestige of Spanish origin that antedates 1605. Lapidary inscriptions, however, exist of older dates. Mr. F. H. Cushing found, while at the so-called "Inscription Rock" last October, the name of Francisco Sanchez Chamuscado and of three of his companions, together with the year of their excursion into New Mexico—1581; and I also found at the same spot the inscription of Juan de Oñate—1605, April 16. Some of the numerous hieroglyphs at the rock named have been read as giving much older dates, but I can positively assure that there is none anterior to the time of Chamuscado. Neither is it likely that any older one will ever be found at the "Morro," since Coronado and his men took a route which led them far to the south of the place, and at least thirty miles below it.

SANTA FÉ, N. M., March 5, 1889.

OF THE USE AND ABUSE OF EXAMINATIONS IN COLLEGE.

TO THE EDITOR OF THE NATION:

SIR: If you will permit me, I would like to present to the readers of the *Nation*, among whom are doubtless many college professors, the results of some study and experience bearing on the subject named above. This experience as an instructor in the college class-room extends through a period of some seventeen years, and has had to do with the subjects of chemistry, rhetoric, logic, ethics, psychology, and political economy.

At the beginning, an oral examination was held on each subject studied, at or near to the close of each term. This was soon found to be very unsatisfactory. A half day of three hours was allotted to the examination. This allowed only fifteen minutes each to a class of twelve, and less than that in a larger class. It soon became apparent that this was little better than a farce. If a student was allowed to succeed, or was made to fail, by such an examination, it was easy to see that it was largely by *chance*. It seems absurd to think that any just knowledge can be got in this way of the student's ability, or of his proficiency in the particular subject. Moreover, it became equally apparent that, as an exercise for the improvement of the student himself, it was nearly, if not altogether, worthless.

The first step consisted in substituting a *written* examination for the oral one; to which again the half day was given. This was a great improvement. Each student was exercised the full half day, and thus much better grounds were gained for judging of his ability and proficiency, and much of *chance* success and failure was eliminated. But it still remained a crude test, even of proficiency, and it was still possible to succeed or fail by accident. Preparation for it led (almost necessarily) to *cramming* in nearly the worst sense of the word. Its value as an exercise to the student is much greater than the oral examination; yet, for reasons suggested above, its value to the student is not great. It leads, however, to one vice that is almost serious enough to condemn it altogether—the vice of *cheating*—of trying to pass the examination by fraud. The successful passing of it is made to mean so much in nearly all colleges that students are drawn into the practice of all sorts of tricks and frauds in the conduct of it. They seek to get a knowledge of the topics of the examination paper beforehand; they make and carry in notes concealed from the professor by every conceivable artifice; they secretly assist one another; they tear up text-books and conceal the fragments about the person in many ways; they laboriously plan to cheat by whatever device may promise success, and it has to be confessed that by these tricks they do too often succeed. All this is bad, very bad, and it is inconsistent with worthy aims and honest work in the pursuit of knowledge and improvement by the student. And it is hardly less bad that, by reason of it, the Faculty are led to so arrange and conduct these examinations as practically to say to the students, "We think you are all knaves." A dozen years ago the writer became weary and heart-sick of such examinations, and set himself to study the problem seriously, with the view, if possible, to find some better way—a way that would be more effective as an examination, and at the same time be consistent with the dignity of worthy aims in scholarship, and in some degree promotive of them; some method that would do away with cheating, and admit of only honest study for preparation, and that would, if possible, wholly eliminate *chance* from the result.

The procedure finally adopted and put into practice in this college may be briefly described as a method of *detailed written reviews* of the various subjects of study. It was introduced by degrees, and tentatively, that effects and tendencies might be carefully studied. The results from the first appeared to be most gratifying; and then the method was extended to new subjects, and it was also made more and more detailed and thorough in the subjects to which it was at first applied tentatively. For ten years now this method has been in full development and use here in a large number of subjects. The writer employs it in all the subjects that he teaches, and teacher and students alike have borne enthusiastic testimony to its worth.

That it may be known just what the procedure is in practice, allow me to describe it in some detail in connection with a particular subject of study. Here is rhetoric—text-book, Whately's 'Elements.' The subject is first gone over carefully in a series of lessons, recitations, and running lectures by the professor, each lesson covering about ten pages of the text. Then comes the review. An average of from twenty to twenty-five pages of the text, and the professor's instructions thereon, are assigned for each exercise. For each exercise a careful selection of the topics under review is placed on the blackboard. To make the *written* exercise still more particular, two sets of such topics are usually made and put on the blackboard, marked No. 1 and No. 2. Each student draws a number, and then proceeds to write up the set of topics corresponding in number thereto. One hour is the time usually allowed for writing the exercise. The professor takes the papers, reads each one carefully, marking all observed errors, and then returns them to the writers. Each student has in this way an opportunity to review the errors he makes, a matter of much practical value to the student.

In ethics the subject is first treated in a series of thirty-four lectures, of one hour each. Each student is required to take notes on these lectures, and he is encouraged to make them as full and accurate as he can. After the lecture he rewrites and improves his notes. In the review the procedure is the same as that described of rhetoric, and the whole course of lectures is gone over in a series of twelve papers. Similarly logic is reviewed in a series of more than twenty papers, and other subjects are treated in like manner. Now, what are the observed results? Note the following. The *student* can hardly fail to get a good knowledge and understanding of the subject; the *teacher* gets an almost perfect view of the ability of the student, and of his knowledge and understanding of the particular subject; *chance* is eliminated—the student cannot succeed, and he cannot fail, by chance or accident; the student makes rapid, often wonderful, improvement in avoiding the errors to which he was at the start subject; he gets a *training* in ready and correct composition, and an amount of it not easy to give him at all, nor so effectually, in any other way; the student's *mental powers* gain a most practical and useful training and development; *cheating* is impracticable and of no avail in these daily continued exercises, and it is apparently seldom even thought of.

These are some of the results which the professors here have been attaining for a dozen or more years; and they are results which have been of inestimable value to the graduates. But here some will probably object that this method means an enormous amount of work for the professors and tutors; and this is true. It does mean a large amount of work—work, too, that some teachers will call drudgery. Let no professor who is sparing of his work enter on this method. But experience here plainly teaches that professors and tutors who are willing to work, and work hard, in the interest of the best training and development of their students for usefulness and practical efficiency in life, may find in this method of procedure a means which they cannot afford to slight.

Yours respectfully, A. G. G.

ST. LAWRENCE UNIVERSITY, March 18, 1889.

THE EXCAVATIONS AT DELPHI.

TO THE EDITOR OF THE NATION:

SIR: I should be sorry to stand in the way of any honorable scientific ambition of our people, but I am satisfied that if the directors of our School of Hellenic Studies at Athens understood the position of the proposed excavations at Delphi, it would not be possible for them to enter into the proposed bargain with the Delphini for the privilege of uncovering what may chance to remain of the appurtenances of the Oracle. The present director of the French School here began work in 1861 by purchasing a piece of land and excavating it, and his successor followed with another field. Ever since then negotiations have been going on, not without interruptions, for the complete excavation of the site. The French School has the prior claim, not only by agreement with the Government, but by that courtesy which the American School will not, I am sure, fail in. The French School has not withdrawn its claims, and, without entering into needless details, the entry of a competitor into the field who has the reputation of having millions to throw away, but the greatest indifference about throw-

ing them away, has simply had the effect of raising the price of the village from about $25,000, which is the highest value which can be put on it, to $80,000—a species of auction admissible for city sites, but not for scientific research.

The German School, which certainly has greater facilities than the American for the work, refuses to enter into any such competition, recognizing the moral claims of their sister institution. The present aspect of the matter is this: the French School has several times been accorded the concession of the excavations, and originally the Greek Government was to expropriate the land, receiving for the Greek museums all the results of the work; the French paying all the expenses and getting all the honor. The later conditions are, that the diggers shall pay for the land and the work and the honor whatever the Greeks of Delphi see fit to demand; and as the Americans are supposed to have more money, they are asked three times what the land and village are worth for the privilege the excavations will confer. The upset price of the village is, as I have said, $25,000. The excavations will not remove the whole of it, but if there are two competitors in the market, not only the whole will be insisted on, but the exorbitant price now demanded will be maintained, and what beyond, no one can guess who has not had some experience of the way the Greek peasant looks at every object of antiquity. In Foucart's last campaign the people of Delphi made an elaborate calculation that he had made by the publication of the inscriptions found not less than 14,000,000 francs. Imagine the effect of such views on the estimates to be placed on every concession made or to be made when the Government itself does not control the conditions; and this is impossible in the present state of Greek politics, for any favor shown the foreigner is set down as want of patriotism, and will create embarrassments for the Ministry.

But this is a secondary consideration, and will, I hope, be so regarded by our people. The essential is, that the French School has by courtesy a claim not to be interfered with under the circumstances, and our appearance in the field as competitors only increases the difficulty for whoever does the work. The site is offered for competition under conditions that ought to prevent the American School from accepting it. There are plenty of sites which are not so preëmpted, and where excellent work can be done. Yours truly, W. J. Stillman.

Athens, March 2, 1889.

MR. COLE'S WOODCUTS IN THE *CENTURY*.

To the Editor of The Nation:

Sir: The engravings by Mr. Cole which are appearing from month to month in the *Century* as illustrations of the "Old Italian Masters" have hardly attracted the attention they deserve.

Nothing that has yet been done by the American engravers on wood who, during the last few years, have carried their art to the highest excellence in reproducing the characteristic qualities of the work which they have had to copy, has surpassed in exactness of delineation, in refinement and vigor of execution, and in sympathetic rendering of the subtlest features of the original, these remarkable productions of Mr. Cole. The variety of the technical methods of which he shows himself master has enabled him to reproduce with equal success work as widely different in motive and style as the mosaics of Ravenna and the panel paintings of the Florentine artists of the fourteenth century.

No engravings hitherto existing of the works of early Italian art give so much of the essential spirit as well as of the manner of painting of these works as this series of Mr. Cole's. It is, therefore, invaluable to the student or the lover of the art of a period when the poetic genius of Italy was inspired with the first flush of conscious power, and was endeavoring to express itself in forms of beauty which it was not yet able completely to realize, but which, in their very simplicity and imperfection, often possess a charm beyond that of the more complete performances of a later and more sophisticated age.

Mr. Cole's skill is so masterly, and his artistic sympathies are so broad, that there is no doubt that he will reproduce the work of the painters of the fifteenth and sixteenth centuries not less admirably than he is doing that of their forerunners.

His notes upon the pictures which he copies are full of interest in connection with his engravings, and Mr. Stillman's papers which accompany the illustrations are excellent.

There is much more to be said of these engravings, but I have said enough, for the present at least, if my words induce those of your readers who have not hitherto paid attention to them to recognize their extraordinary merit and exceptional interest.

Your obedient servant,
Charles Eliot Norton.

Cambridge, March 24, 1889.

BENJAMIN VAUGHAN AGAIN.

To the Editor of The Nation:

Sir: Apropos of Mr. Benjamin Vaughan, it may be interesting to some of your readers to know that he was the cause of Dr. Rice's making the first American reprint of Captain John Smith's 'General History' (Richmond, Va., 1819, 2 vols., 8vo). A young Virginia lawyer, Mr. Francis Walker Gilmer, whose letters are being edited for the "Johns Hopkins Studies in Historical and Political Science," spent the winter of 1814-15 in Philadelphia, where he became intimate with Mr. John Vaughan, whom your correspondent Mr. Kerr so pleasantly described in a recent number of the *Nation* (No. 1237). On the recommendation of this gentleman, Mr. Gilmer (who was quite a scholarly young man) began a correspondence with Benjamin Vaughan upon matters of antiquarian interest. From the four letters of Vaughan's that have been preserved, we see that he recommended Gilmer to study Smith, and even sent him his own copy of the 'General History' (London, 1629). If my memory is correct, the suggestion of the propriety of an American reprint came from Mr. Vaughan; at any rate, he was warmly in favor of the project, and so Gilmer induced Dr. Rice, a well-known Presbyterian clergyman, and the editor of a Virginia religious magazine, to undertake the publication of the reprint from the copy Mr. Vaughan had lent. It may be remarked that Mr. Gilmer afterwards rendered great service to his State by securing Long and Key and Dunglison for the first faculty of the University of Virginia.

Now, if we recall the eloquent tribute to Captain Smith which George Long introduces at the end of his biographical sketch of Marcus Aurelius, and in which he says, "Smith is almost unknown and forgotten in England, his native country," we shall have, I think, a reason for holding a high opinion of Benjamin Vaughan's scholarly attainments.

Your obedient servant, Wm. P. Trent.

The University of the South, Sewanee, Tenn., March 20, 1889.

THE ORIGIN OF *TOPSYTURVY*.

To the Editor of The Nation:

Sir: The Rev. Professor Skeat, in the Supplement to his *Etymological Dictionary* (1884), speaks of this common word as being "practically unsolved." Any new facts, or arguments based on facts already known, tending to account for its development cannot, therefore, but be welcome to those who are interested in the history of our vocabulary.

Among English locutions convertible with *topsyturvy*, and beginning with its first verbal element, the oldest which I have made a note of is seen in the following verses:

"His folk went vpto lond, him seluen was the last.
To bank, ouer the sond, plankes thei ouer kast.
Als William ther on suld go, he stombled at a nayle;
Into the waise tham fro he tombled *top ouer taile*."

So wrote, about 1330, Robert Mannyng, of Brunne: *Peter Langtoft's Chronicle* (ed. 1810), p. 70. With others, the author of *William of Palerne* (about 1350) l. 2776, and John Barbour (1375), in his *Bruce*, VII., 455, have the same phrase. In the *Chevelere Assigne*, of the end of the fourteenth century, we find, in l. 320, the term *topseyle*, as to which Mr. H. H. Gibbs pertinently asks: "Should it be, perhaps, 'topteyle'?"

In the anonymous *Cronycle of Englonde*, which was repeatedly printed in the fifteenth and sixteenth centuries, there occurs, in Pynson's edition of 1510:

"And our stakes made theym *toppe ouer terue* eche one ouer other, that they laye on hepes two speres lenthe of hyghte." Sig. aa 1 *v.*

Having come upon this passage, I traced it back, and found this reading of it in Caxton's edition of 1480:

"And oure stakes made hem *toppe ouer terue* eche on othir, that they lay on hepes two spere lengthe of heyhte." Sig. t 6 *v.*

The St. Albans edition, referred to 1483, exhibits, at sig. G 2 *v.*, "made them *toppe our terue* eche on our othir," in which the second *our*, "over," is represented by a contraction. *On*, as in Caxton, is "one."

Probably from the Anglo-Saxon *torflan* came, *torvien* intervening, the verb *terven*, *terve*, the old past participle of which was not too archaic for Caxton, who, supplementing Higden, has, in 1582, "The Yomanrye had theyr hosen *teruen* or bounde bynethe the knee, hauynge longe Iackes." Trevisa's Translation of Higden's *Polychronicon* (ed. 1595), fol. 330 *r.* Here, as in other places where it is met with, *terve* seems to have the sense of "to fall," or else that of "to be made to fall," "to throw down," "to cast."

In two passages quoted above, it may be that, in *ouer othir*, *ouer* is pleonastic, much as the first *out* is in, "Let me pull out the mote out of thine eye." Otherwise, *overterve* is intransitive there. Caxton, however, clearly makes the verb, with him part of a strange compound, transitive; and it appears that, employed thus, it cannot have been very unusual in his time. An author who was still living in 1465, again and again has the infinitive *overterve* and the past participle *overterved*. See John Hardyng's *Chronicle of England* (ed. 1812), pp. 47, 186, 408, and pp. 59, 60, 75, 155, 398.

Of *topsyturvy* no earlier instance has, to my knowledge, been produced than that which, in my *English Adjectives in -able* (1877), I cited from William Roy and Jerome Barlowe (1528), whose spelling is *topsy tervy*. But it would be highly rash to assume that it was of their devising. In 1530, Palsgrave recorded the form *topsy tyrvy*. A little later the word became very popular.

Let us now turn to a phrase much more ancient than *topsyturvy*, and one with it in import. Soon following, it seems, *up to down*, appeared, betimes in the fourteenth century, or before then, *up swa doune*, which was shortly changed to *up so doun*, *upsodoun*, and *upsodon*. Richard Rolle de Hampole (about 1340), the oldest authority for *up swa doune*, has also *up that es doun;* and a single instance of *up tho so downe*, "up then," etc., in a book printed in 1483, has fallen in my way.

The corruption *upsedoun*, as old as Wycliffe, is found, written *upsedowne*, in Lord Berners's *Froissart* (1523), in John Rogers's *Bible* (1537), and elsewhere. And afterwards came *upsedown*, *upsydown*, and *upsyedowne*. Among the illiterate, in some parts of England, one may, even now, often hear *upsedown;* a curious survival, if not, as is more probable, simply the result of slurring, in utterance, *upside down*.

As I pointed out in 1877, Alexander Barclay, in his *Shyp of Folys* (1508), and not only there, substitutes, for *up so doun*, *up set downe*. This new form was accepted, in 1540, by Richard Hyrde, in 1559, by Bp. Thomas Cooper, and, in 1569, written *upset downe*, by James Sanford, who has also *topset downe*. Carelessness of pronunciation, or else a fancy about etymology, looks like a sufficient reason for Barclay's invention or adoption.

As was the genesis of *up set downe*, so, presumably, was that of *upsyde downe*. Palsgrave knew the latter in 1530; Bp. Coverdale (1535) and John Rogers (1537) used it in rendering *Psalm* cxlvi., 9; and it was soon permanently established. That *up so down* is an "ignorant spelling for *upside down*" is the ludicrously unhistorical assertion of the Rev. J. H. Todd, glossing the *Apology for Lollard Doctrines*.

That, in imitation of *upse*, from *up so*, was produced *topsy*, is no perilously hazardous conjecture. *Top so*, corresponding to *up so*, has not, so far as I am aware, yet been discovered.

The contention that *turvy* is to be explained through *toppe over terve*, or something very like it, receives support from Row and Barlowe's *tervy* and Palsgrave's *tyrvy*. The verbs *terve* and *overterve* were no longer familiar in their day; and their *tervy* or *tyrvy* is no more of a liberty than what we see taken, a few years afterwards, in *arsy-versy*, which had become common when Nicholas Udall employed it in 1542, in *howrley burlei* (1534), *whorle borle* (1552), "*hurly-burly*," and in Sir Thomas Wilson's *hittie missie* (1553).

I have, now, at least disabled all the etymologies of *topsyturvy* that I am acquainted with. These are numerous enough, and no less numerous than futile, as I evinced on a former occasion. At present it will suffice, then, to notice two of the latest to which well-known writers have signified their adhesion; their judgments illustrating, by opposition, the prudence of postponing dogmatism to investigation. The expression, according to Dr. Trench, is a shortening of *topside the other way*. Confronted with such legislative finality as attaches to archiepiscopal cocksureness, we are, as it were, challenged to believe that "there is no doubt of the fact"; and Mr. Hensleigh Wedgwood is quite as peremptory with reference to the equivalent *top side t'other way*. Mr. T. L. Kington Oliphant (1886) is equally certain in favor of *top side turf way*, as its original. Yet one is warranted in strongly questioning, if not in almost denying, that either *side*, or *the other*, or *turf*, or *way*, was ever a constituent of it.

If only for its oddity, the following passage is worth quoting:

"Let all the misticall drifts and ambiguous designes of inveigling man turne *topsoltiria*, or upside downe, I care not." William Lithgow, *A most delectable and True Discourse* (1623), p. 202.

Was Lithgow here wronged by his printer? Provided he did not mean, after his crazily emancipated fashion of coining words, to annex the Italian *sotterra*, "underground," to *top*, it is beyond me to suggest the source of his *topsoltiria*.

Among variations of *topsyturvy* which I have come across are *topset torvie* (1558), *topsetturvie* (1569), *topset tirvi* (1573), *topse torve* (1579 and 1581), *top syd turvie* (1582), *top turvye* (1582), *tupsiturvie* (1640), *turvy topsy* (before 1687), and so on. *Topside turvey* was patronized, as by others, by Thomas Kyd (1594), Spenser, and Bp. Richard Mountagu. Charles Cotton (1664) writes: "Then turning *topsey* on her thumb." So much for the adverb.

Thomas Phaer (1562) and Joshua Sylvester (1606) have the transitive verb *topsy turn*, *topsie-turn;* Thomas Heywood (1613), *topsiturn*. Florio wrote, in 1603: "Confounding and *topsieturving* the visage of all things." Samuel Richardson (1740), Mr. Carlyle, the first Lord Lytton, and Mr. Bernard Cracroft (1868), also use *topsyturvy* as a verb transitive. Southey (1807) has the gerund *topsey-turveying*.

Chapman (1612) has *topsyturvy* as an adjective; and so have Dean Swift (1703), the Rev. F. E. Paget (1856), and Dr. J. H. Appleton (1878).

As a substantive, *topsyturvy* is used by the translator of *Francion* (1655), by Mr. John Morley (1878), and by "George Eliot" (1879).

Two quotations are also at hand for *topsyturveydom*, two for *topsy-turvyism*, and one *topsy-turveyfication*. All are of our own day.

It may be as well to mention, in conclusion, that I first proposed to connect *topsyturvey* with *toppe over terve* in this journal, June 15, 1882.—Your obedient servant, F. H.

MARLESFORD, ENGLAND, November 10, 1888.

In place with the quotations from Daniel Tuvil and the Rev. John Hales, in col. 2 of p. 336, *supra*, is that which here follows:

"He knew . . . That his Counsels, which course soever he tooke, would not bee by them *eliminated*." Henry Seile, *Augustus* (1632), p. 79.

P. S.—In p. 96, col. 3, a little below the middle, read, instead of "stands," "does not stand." In the same col., near the foot, substitute "my fuller" for "any fuller." F. H.

FEBRUARY 12, 1889.

Notes.

FREDERICK WARNE & Co. will supply the American market with a new series of standard and popular works in all departments of literature, issued at intervals in handy pocket volumes, and to be called the "Victoria Library." A volume of 'British Oratory' will lead off.

G. P. Putnam's Sons make further announcements for the spring as follows: 'The Ideals of the Republic; or, Great Words from Great Americans'—the Constitution, Washington's inaugurals and Farewell Address, Lincoln's inaugurals and Gettysburg Address, in the Nuggets series; 'The Constitutional History of the United States, as Seen in the Development of American Law'—papers by Judge Cooley, Henry Hitchcock, Geo. W. Biddle, Chas. A. Kent, and D. H. Chamberlain; a translation of Dante's 'Convito,' by Katharine Hillard; an 'Essay on Money,' by James Platt, from the 19th English edition; and 'Seven Thousand Words Often Mispronounced,' by Mr. Phyfe.

Parallel with the first of the above announcements of the Messrs. Putnam is an "Old South Leaflet" containing Washington's inaugurals and the addresses of 1789 and 1793. The Farewell Address and Lincoln's inaugurals have already been published in the same useful series (D. C. Heath & Co.).

The new volume of the 'Musical Year-Book,' published in Boston by G. H. Wilson, 152 Tremont St., will appear about May 20. It is the sixth issue of the series.

The new edition of De Gubernatis's 'International Dictionary of Writers of the Time' (Dizionario Biografico degli Scrittori Viventi) is to appear in French as well as in Italian (Florence: Louis Niccolai; New York: F. W. Christern).

Gustav Fischer, Jena (New York: Christern), has undertaken publication of a practical 'Dictionary of Political Science' (Handwörterbuch der Staatswissenschaften). It will be very strong on the statistical side and on the bibliographical, and complete lists of the works of eminent political scientists will accompany the brief notices of their lives. The work will be brought out in parts, and will require three years for completion.

We have received the prospectus and sample sheets of the 'Century Dictionary,' which will begin to be distributed to subscribers in May. Prof. W. D. Whitney has been the editor-in-chief, with a singularly strong corps of assistants. As our readers have been apprised, this new work is of the cyclopædic kind, and it is estimated that it will contain no fewer than 200,000 words. The illustrative quotations will be correspondingly numerous, and the pictorial definitions from 5,000 to 6,000. Of these cuts it is not too much to say that they surpass anything ever attempted in a similar publication. The column is a trifle wider than that of the 'New English Dictionary' of the English Philological Society, and also longer, and in forsaking the old-style letter we believe the Century Co. have produced a more legible text, save in the one particular of Arabic numerals. We can specify nothing more at this time, except that the Dictionary will make six volumes quarto, and will be finished in two years.

A tentative 'List of the Issues of the Press in New York,' 1693-1752, by Charles R. Hildeburn, has been reprinted from the *Pennsylvania Magazine of American History*.

From Macmillan & Co. we received some time ago 'The Civilization of Sweden in Heathen Times,' by Prof. Oscar Montelius of the National Museum, Stockholm, translated from the Swedish by the Rev. F. H. Woods. The first part of the original ("The Stone Age") was published in 1874, and a second edition of the entire work appeared about four years later. It has since been made accessible to scholars generally through a German translation; but the English translator states that the volume before us embodies the results of researches made by Dr. Montelius down to the year 1888, and that the proof-sheets have been revised throughout by the author. The reputation of Dr. Montelius is so well established among archæologists that it only remains for us to say that the general reader will find much to interest him in this account of prehistoric life in Scandinavia. The book is illustrated with numerous woodcuts of arms, implements, ornaments, etc., of flint, bronze, iron, silver, and gold.

A valuable addition to the literature of domestic affairs is Catharine Owen's 'Progressive Housekeeping' (Boston: Houghton, Mifflin & Co.), which seems to us the very book of books for a young woman to absorb when she be-

comes mistress of a home. It is not a cook-book, though containing some suggestions in that line, but a treatise upon the best methods of doing all manner of housework; for example, we are told with great exactitude how to manage the kitchen fire, to scrub tables, wash windows, sweep without letting the dust fly, etc. The book makes a specialty also of plans for the timing and arrangement of work, more particularly in small households.

The bound first volume of *Belford's Magazine* (Belford, Clarke & Co.) revives our first impressions of this unique periodical, in which literature and eternal enmity to protection have formed a partnership. Neither department has swamped the other, and the readers enticed by the belles-lettres side can hardly fail to be affected by the economic propaganda carried on by such writers as Prof. Sumner, Mr. R. Q. Mills, J. G. Carlisle, T. G. Shearman, Frank H. Hurd, Henry George, and many another besides these and the industrious editor himself, Mr. Donn Piatt. Mrs. Piatt furnishes some of the best of the poetry, and there is an agreeable diversity of literary miscellany.

The renovated *Cosmopolitan Magazine* for April adjusts its contents to the approaching centenary festival in this city, but its most significant feature is the first of a series of articles on the anti-slavery struggle, or "The Great Agitation." Mr. Moncure D. Conway has the floor to tell of Southern abolitionists, which he does entertainingly enough, but without precision or much more than a superficial glance. It is surprising that, as a Virginian, he should make no mention of the Rev. George Bourne's anti-slavery ministry in that State, and of his concentrated Bible argument against the system, 'The Book and Slavery,' in which for the first time the duty of immediate emancipation was specifically enforced, and which had more effect in breeding abolitionists than all other Virginian publications put together. The article closes with some autobiographical glimpses. The proof-reader has converted Dr. Gamaliel Bailey of the *National Era* into "Dr. Griffin Bailey."

Scribner's railway articles are to be succeeded in June by a new series on "The Practical Applications of Electricity," by competent writers, with helpful illustrations.

An American edition of the illustrated monthly magazine, *Artistic Japan*, is to be sent out from No. 220 Fifth Avenue, back numbers to date being furnished, after which the publication will be simultaneous on both sides of the water. It is a "journal of arts and industries, for the use of the artist, the amateur, the manufacturer, and the artisan," conducted by S. Bing. Each part contains ten royal quarto colored plates, in addition to the designs incorporated in the text. These are all promised to be of the same excellence as in the European edition.

We have received sample sheets of the first number of a new quarterly historical review, *Deutsche Zeitschrift für Geschichtswissenschaft*. The editor is Dr. L. Quidde of Königsberg; the publisher, J. C. B. Mohr of Freiburg i. B. According to the prospectus, the *Zeitschrift* will contain: (1) Essays on the mediæval and modern history of Europe, including papers on historical method, historiography, etc.; (2) Minor original contributions and extracts from sources; (3) Papers on the historical literature of the different countries of Europe; (4) Notes and news concerning learned societies, recent publications, works in preparation, etc.; (5) A systematic bibliography of German history. Judging from the sheets before us and from the list of able contributors given in the prospectus, the new *Zeitschrift* promises to rival, if not excel, *Sybel's Historische Zeitschrift*.

Two articles in the *Harvard Law Review* for March arrest attention, viz., Judge Cooley's on the "Comparative Merits of Written and Prescriptive Constitutions," and E. Irving Smith's on "The Legal Aspect of the Southern Question."

The principal article in the March number of the *Library* is the interesting account of the Brothers Foulis and early Glasgow printing, read before the Library Association, last September, by Professor Ferguson. Chancellor Christie's paper, "A Dynasty of Librarians," briefly sketches the fortunes of the Bignon family, whose members ruled almost uninterruptedly for a century and a half, from 1642 to 1783, the Royal Library of France—a dynasty without parallel in the history of libraries. Mr. Garnett has a note on the Livy of Pope Alexander the Sixth, now in the British Museum, and Mr. Duff of the Bodleian reports the probable discovery of a hitherto unknown English printer of the fifteenth century. In this number the foibles of the Theoretical Librarian furnish the subject for a clever character sketch by Theophrastus Junior.

Sun and Shade for March has a photogravure portrait of Mr. Blaine, and the usual variety of still-life scenes, copies of paintings, studio compositions, etc., none of a very striking nature, yet displaying well the range of the process.

The Spanish bull-fight mostly occupies *Paris Illustré* for March 16 (International News Co.). Three colored and sundry other large plates accompany the letterpress.

A comely *Revue Française*, monthly, devoted to literature, art, and science, is launched this month at 39 W. 14th St. and 851 Sixth Ave. (Boston: Carl Schoenhof). M. L. Boisse is the editor.

A lively debate raged recently in the London *Athenæum* over the exclusive right to the initial *Q.* as a literary mask. Consideration is certainly to be paid to initials, arbitrary or genuine, which are commonly identified with a particular writer. The editor of the *Tribune*, for example, should hardly (nor do we believe he would) permit a Washington despatch to be signed "J. G. B.," even if the sender chanced to be some James Gordon Bennett and not our Secretary of State. In Shaksperian circles "H. H. F." suggests one name above all others, and we think that the editor of *Shakespeariana* should not have set a trap for the unwary by allowing another contributor to appropriate Mr. Furness's trade-mark, as he did in his last issue. We fell into this trap ourselves, and can confess it without mortification, yet not without regret at our false attribution.

Prof. Antonio Favaro of the University of Padua, who is in special charge of the national edition of the works of Galileo, sends us an alphabetic and topographic index of the astronomer's *commercio epistolare*, to stimulate search for letters written by or addressed to him. That from our American archives, or libraries, or private autographic collections, Prof. Favaro can expect to draw any material, we greatly doubt; but we cheerfully spread the intelligence of his quest. He will publish what is sent him, and acknowledge the source.

—The April *Harper's* naturally puts foremost the subject of the approaching centennial celebration in this city, and brings very useful illustrations of the changes of the century in its reproductions of old prints of Washington's triumphal progress from Mt. Vernon to the seat of the new Government. These prints themselves remind us of the modesty of our beginnings, and Mr. McMaster's text harmonizes with them. He does his best to make the reader realize the comparative smallness of our territory, the scarcity of the population, and the confusion of the political life of the jarring members of the Union, and so to impress on the mind the difficulty of the great task which Washington took upon himself. Mr. Moncure D. Conway also contributes some hitherto unpublished details of Washington's life, with new letters; but these regard almost exclusively his family and kindred. The most interesting of them is his letter of advice to a nephew, instructing him in what way to get on in the world, what clothes to wear, and what society to frequent. The conclusion of the epistle, in which he makes the continuance of his affection and good offices conditional on the nephew's conduct, is a striking example of the way in which parental and semi-parental obligations were interpreted a hundred years ago. Mr. Theodore Child continues his Parisian studies with an entertaining account of the history of the café, accompanied with several effective cuts. The café is almost a part of the history of the development of the French Revolution — the salon of the present century; and in connection with the papers upon Washington, its description here recalls the contrast, which must occur to many minds, of the centenary of '89 in the two countries which began the course of democratic freedom together. A description of Abbotsford, from the pen of Sir Walter Scott, is the literary curiosity of the number. Tangier and Morocco are described in the French impressionist manner, the growing influence of which in papers of travel is, perhaps, partly due to its fitness for magazine-work; and there is a bunch of beautiful engravings of diving birds.

—The office-boy has evidently had full swing in preparing the index to the ten volumes of the *Andover Review*. He has not only never gone behind the label of the article, but, for want of collocation of the various papers on the same subject, a person who relied upon the index would fail to find the greater part of them. Thus, to all appearance, there has been but one article each on the "American Board" and the "Andover Theory of Probation." Among the articles on Mormons are *not* those entered under "Utah, Church—State" and "Utah, Conquest of," though they are by the same writer. A person seeking information about Bach would find it, but if he looked for Händel, who is the joint subject of the article, he would find nothing. The same remark applies to "Arnold (T.) and the Oxford Movement," and to "Tolstoi and (M.) Arnold." If he looks for Atonement, he will find one article, but not a second, equally long, because, though its title and length are the same, it is one of a series, and is entered only as a sub-title under "Progressive Orthodoxy"; nor a third, because it is only the joint title with "Blood Covenanting." According to the index, not one article has been printed about Christ or Jesus. It is needless to say that there were several, but each has been carefully hidden under the caption, "A Bible Study." One article about the "Teaching of the Twelve Apostles" is entered under that title, while another is discoverable only under "Bryennios." "Church Problems in Germany" is entered under C, but the "Religious Condition of Germany" is under G, and "Theological Tendencies in Germany" under T, with no cross-reference in either case. George Eliot, Victor Hugo, and Matthew Arnold are alike entered under the first name, and "Judge Allen" under J. There is nothing about Noyes (W. H.), but there is an entry,

"Additional Documents in the Case of Mr. W. H. Noyes." There is an article entered as "Question Restated, The," without anything to indicate what question, and another as "False Test, A." "A Roman Martyr," "A Scotch Mystic," "A Sturdy Christian," are vague enough titles to suit the most exacting office-boy, as is also "A Typical Novel." There is no list of authors, but, to make up for this, the entries are arranged in two alphabets, according as the articles are by the editors or by contributors.

—Of all the correspondents who have written to inform us that the fact of Shakspere's residence in St. Helen's Parish (*Nation*, No. 1236) was no discovery of ours, no one has hit on the worm-hole from which we plucked our account of the indenture which proves this fact. It was a corner where no one would look for anything Shaksperian, viz., in 'The Genealogical Dictionary of First Settlers of New England, showing three generations of those who came before 1692,' by James Savage (vol. ii, p. 528). Could a miser hide his hoard more adroitly? Savage claims that he found the statement, and we naturally supposed ourselves the first who chanced to notice his finding, especially as we did not see it in Phillipps. But we have since read the indenture *in extenso* in Hunter's 'New Illustrations of Shakespeare' (vol i, p. 77), published after the date of Savage's find. Hunter says: "In the course of any researches of my own, only one document [the indenture] has presented itself which is entirely unknown, containing a notice of Shakspere during his London life." Whether the indenture was shown to Savage by Hunter or to Hunter by Savage, it seems impossible to determine. Neither alludes to the other. That Mr. Phillipps knew nothing of the indenture, we must believe until some allusion to it is pointed out in his works. Such ignorance on his part would have been in keeping with what a correspondent writes, that "the prejudices and eccentricities of Mr. Phillipps hindered as much as his enthusiasm helped his work; that he would not institute inquiries in counties far remote, nor would he authorize a thorough search after those who must have inherited and divided the possessions of Elizabeth Hall," etc. Nor could such ignorance surprise us, for, in 1884, we heard him declare that he had never seen Schmidt's 'Shakespere Lexicon,' which had already been published for ten years.

—On March 5 was performed in Berlin for the first time, at the Royal Theatre, under Henrik Ibsen's supervision, his latest drama, "The Lady of the Sea." The story is a fantastic one, of a married woman grown morbid because of a mariner to whom, in her own home by the sea, she had formerly plighted herself, and whom she supposed dead before marrying, yet now fears to have appear and make rightful claim of her affection. He turns up, in fact, in the course of the play, and would make off with her, but this destroys the spell he has hitherto laid upon her conscience, and she remains by her husband. A correspondent writes us:

"In this play Ibsen shows his power as a dramatic poet to the best advantage. The way in which the interest is aroused from the very beginning, and is constantly heightened to the end; the fact that every act ends with a scene which makes us expect the beginning of the next act with the greatest impatience; the skill with which all figures are grouped about the central one; the dialogue which so subtly reveals the character of each speaker; the beautiful scenic background (a large part of the action takes place out of doors near the mountains of the Norwegian fjords), which helps to increase the poetic mystery in which the whole piece is wrapped—all these things prove Ibsen to be a master of dramatic technique. But the play has more than technical merits. Ibsen shows a wonderful insight into the workings of the human mind in the description of *Ellida's* condition. She speaks in a curious, often only half-intelligible way; she loses her interest in her surroundings, and spreads an inexplicable atmosphere of unrest about her. One is made to feel that her condition is rapidly growing worse, and yet this is so carefully done that it would be difficult to mention any one passage which proves this statement. The author is no less admirable in showing how *Ellida's* unnatural state of mind is warping the characters of her stepdaughters. *Bolett*, the elder, is a kind-hearted and earnest girl of about twenty, whose ambition it is to learn something, and to have a larger field of action than she can find in their little town. She cannot discuss her plans with her father, whose thoughts are too much taken up with his wife; much less can she speak about them with her stepmother; she grows dissatisfied, and at last consents to marry a man whom she does not love, simply because she has reason to think that her long-cherished hopes will be realized through him. *Hilda*, her younger sister, is a fiery and impetuous creature, who grows miserably bitter and cold from lack of sympathy and attention on the part of her parents. Great as are the merits of the play, the subject is too little adapted for a drama to make it a success on the stage. Still, though the most undramatic of Ibsen's pieces, though not fraught with half as much deep meaning as 'Nora,' the 'Spectres,' and the 'Wild Duck,' it is one of the most remarkable and interesting for psychological analysis and development of character. Moreover, it is the first of the poet's social plays (excepting, perhaps, the 'Pillars of Society') which ends optimistically; the first which, after showing us great struggles and difficulties, grants us an outlook into a happier and more satisfactory future."

—A new metrical version of the poems of the Elder Edda has been made, in German, by Wilhelm Jordan, the well-known translator of the 'Nibelungen Lied' ('Die Edda.' New York: B. Westermann & Co.). It is, as a whole, a spirited rendition into alliterative verse of the old lays, whose beauties the author appreciates, and whose difficulties he smooths away with a confident hand. The translation is literary, rather than critical. Strophes considered disturbing—like the list of the dwarfs in the Völuspa—are summarily relegated to the notes that follow each lay. The result is, of course, to secure, from a modern point of view, a more perfect poem, but to vitiate, in the same degree, the spirit of the original. In many instances Jordan's strophes are as good as, in some cases even better than, those of any translation we have. In others the author, evidently actuated by a conscious desire to improve upon the original, is betrayed into a paraphrase which bears but little likeness to his Norse prototype. One of the principal merits of the new translation is the intelligibility of its vocabulary. Led astray by the seductions of old word-forms, many of which were bound up with the alliteration, most of the older translators have been irresistibly tempted into the frequent use of cognates instead of equivalents. Many of these words, in their turn, were already deep under the dust of ages, from which they first have to be freed in order to be understood. Many others, and this is particularly true of English translations, which are sometimes couched in a language that was not, is not, and never by any foreseen contingency can be, were deliberately evolved, and are as much in need of a gloss as the originals which they are supposed to explain. In his intention to avoid an affectation of archaism, on the other hand, the author of the present version occasionally makes a not altogether fortunate choice of words. The notes with which the book is liberally supplied contain explanations of words and phrases, many of them new and at variance with all accepted criticism. The author, at the end of his preface, expresses the confident hope that now at last the Edda will not be, as heretofore, "a book under seven seals." If he has not, perhaps, quite succeeded in loosing all seven of these not too strongly imagined hindrances, he has, none the less, accomplished a difficult task in a manner highly creditable to his literary judgment and to his skill in poetical expression.

CONVERSATIONS WITH THE DUKE OF WELLINGTON.

Notes of Conversations with the Duke of Wellington. 1831–1851. By Philip Henry, fifth Earl Stanhope. London: Murray. 1888.

Sir Philip Henry, fifth Earl Stanhope, who recorded these "Notes" of conversations with the Duke of Wellington, is best known to the world as Lord Mahon, the historian of England. During the twenty years covered by these "Notes," there existed between him and the Duke a friendship the cordiality and intimacy of which appears to have gone on increasing until the death of the great soldier; and it was the custom of Lord Stanhope to record in writing the conversation of his friend while the memory of it was still fresh in his mind. These "Notes" do not add anything of importance to our knowledge of the Duke. Their main interest arises from the confirmation which they furnish of all that was previously known of him. They show the Duke, after all the victories he had won—the foremost man in the Europe of this day—as kindly, simple, and unassuming as the humblest of her Majesty's subjects. There is something especially beautiful in his fondness for children and their responsive love for him.

"The Duke," records Lord Stanhope, under date of October 22, 1837, "has now staying with him two little children of Lord and Lady Robert Grosvenor, who are gone abroad, and his conduct to these chicks displays a kind-heartedness and warmth of feeling such as their own parents could not surpass, but such as the Duke displays to all. Lady Mahon was told by Lady Mary Grimston, who was staying in the house, that the children having expressed their desire to receive letters by the post, the Duke every morning writes a letter to each of them, containing good advice for the day, which is regularly delivered to them when the post comes in."

On another occasion, when leaving Walmer Castle for London, still imperfectly recovered from a very serious illness, Lord Stanhope learned from Mlle. Brun that the Duke stopped at Walmer village, "and got out to take leave of Lady Wilton's children. 'They had received so many kindnesses from him, and bore him so much attachment, that all three—poor little things—ran to the door when he wished to go again, and attempted to bar his way."

His consideration for his servants was not less remarkable than his tender thoughtfulness towards children. "Not many fathers," Lord Stanhope declares, "I really believe, are so much beloved by their children as the Duke is by his servants." Add to all this, not a truer or more constant friend than the Duke ever lived. In the days of his greatness he never forgot the friends of his earlier days, with whom he made his Indian campaigns, and of the Spanish General Alava, who was on his staff at Waterloo and all through his Spanish campaigns, Lord Stanhope has the following:

"Sir Edward Kerrison related to me not many years ago, when he was living at Brighton, he had asked Alava to dinner, and to save Alava's money (for it was during his exile) had sent his own carriage to fetch him. On arriving, Alava thanked him, and said that he felt the more anxious to avoid expense at that time since it was the Duke's money that he spent. The Duke, added he, took me to his banker and said to him, 'This is my friend; and as long as

I have any money at your house, let him have it to any amount that he thinks proper to draw for.'"

But the sterling worth and simple grandeur of the Duke's character are perhaps illustrated in nothing so well as in the despatch which reports the battle of Waterloo. There is not in it a trace of boastfulness or exultation; no effort whatsoever to emphasize the magnitude of the occasion. The victory which overthrew the power of the conqueror of Europe is related as briefly, and with as entire an absence of flourish, as an insignificant skirmish:

"I breakfasted," writes Lord Stanhope, June 28, 1839, "with Hallam, and met Mr. Webster, the justly celebrated American, whose acquaintance I had already made, the day but one before, at a dinner at Lord Stanley's. He told me that on his way out he had been reading two or three odd volumes of the Duke of Wellington's despatches, and had been greatly struck at their total freedom from anything like pomp or ostentation, even in moments of greatest triumph. The Waterloo despatch itself contained nothing about victory and glory. So unpretending was it, said Mr. Webster, that Mr. Quincy Adams—who was our Minister at London at the time, and who had a good deal of bitter feeling against this country, with which peace had only just been concluded—declared on first reading the despatch that it came from a defeated general, and that in real truth the Duke's army must have been annihilated at Waterloo. This he seriously believed for some time."

Of the Duke before Waterloo, General Alava tells the following:

"After dinner, Lord Strangford alluded to Garwood's twelfth volume [*i. e.*, of the Wellington Despatches], which is just coming out, and this led the conversation to Waterloo. 'Je me rapellerai toujours,' said Alava, 'comme j'arrivais de Bruxelles, et je ne savais pas si depuis l'Espagne le Duc serait toujours la tête de Méduse pour les Français; mais quand je suis arrivé, le Duc m'a dit tout de suite, Étiez-vous chez Lady Charlotte Greville hier soir? Alors j'ai vu qu'il était tranquille, et que tout allait bien. Il m'a dit aussi: Ils seront diablement surpris, les Français, de voir comme je vais défendre une position.' The Duke laughed at these recollections, and assented to them."

This Spanish General Alava had a strange fortune. He began life as an officer in the Spanish Navy, and in that capacity the first great engagement at which he was present was the battle of Trafalgar, when, of course, he fought on the side of the French. His last battle was Waterloo, and he was, probably, the only man in Europe who had been present in both these memorable conflicts.

The Duke had a high opinion of the military genius of the first Napoleon. Of all his marshals he thought Massena the ablest, but even he was not comparable with his master. There was no soldier in whose presence it was so fatal to make a mistake as in that of Napoleon. His weakness was that he lacked the patience to fight a defensive campaign. It was to this defect mainly that the Duke attributed the ruinous failure of the Russian invasion. Napoleon here attempted to crowd into a single campaign the work of two or even three, and to a similar impatience the Duke assigns the success with which, after Leipzig, the allied armies baffled the efforts of Napoleon to defend Paris. None the less, the Duke was of opinion that Napoleon's military genius was never seen more brilliantly than in this unsuccessful campaign. "The study of it," he said, "has given me a greater idea of his genius than any other. Had he continued that system a little while longer, it is my opinion that he would have saved Paris. But he wanted patience—he did not see the necessity of adhering to defensive warfare—I have been obliged to do it for many months together—and he threw himself imprudently on the rear of the Allies. Then, of course, they marched to Paris."

This opinion was given in the presence of that high military authority, the omniscient Croker, who took it upon himself to dispute the verdict of the Duke. In his valuable opinion, the strategy of the French Emperor exhibited a remarkable want of skill. "'I can only say,' replied the Duke, 'that my opinion of the campaign is what I have stated. In it Bonaparte beat the Austrians, Prussians, and Russians—different armies—always with the same troops; and I have had experience enough to know how very exact a man must be in his calculations, and how very skilful in his manœuvres, to be able to do that.'" Croker, however, did not forego his belief that, as regards the art and practice of war, the greatest of (then) living soldiers had a good deal to learn from the editor of the *Quarterly Review*. We know, from the Greville Memoirs, that upon one occasion he set himself to contradict the Duke upon the subject of gun caps, and later, in these "Notes," we find him graciously condescending to explain to the Duke the true signification of the scarp and counterscarp of a fort ditch—premising that the Duke appeared to be ignorant on this point.

The Duke had not a high opinion of his allies, the Spaniards. The men, he admits, were fine specimens of humanity, and, taken individually, as brave as any people in the world; but, somehow or other, they could not be got to fight on a field of battle. But the battle of Baylen, suggested Lord Stanhope?

"Oh, Baylen was mismanaged by the French. I knew Dupont afterwards at Paris—he was Minister of War—a very able man, but he took fright and did not understand the Spaniards. It could not have happened again Later in the war, the French would have marched over the Spaniards, instead of capitulating to them. Their general would have said, Retirez-vous, coquins! and off they would have gone. That Baylen, too, was always in the heads of the Spanish officers. They were always for attempting the same manœuvre and surrounding the enemy, insomuch that at last I used always to tell them before any engagement, Now, this is not a battle of Baylen; don't attempt to make it a battle of Baylen!"

Of Talleyrand there are some good stories scattered through these "Notes."

"He is not," said the Duke, "lively or pleasant in conversation, but now and then he comes out with a thing that you remember all the rest of your life. *E. g.*, Talleyrand on his return to Paris from the London Embassy was asked what might be the position in society of a certain Edward Ellice, and replied, 'Je m'en vais vous le dire. Quand on a eu un grand dîner, on donne d'ordinaire encore un réchauffé le lendemain—et c'est au second dîner qu'on invite Monsieur Ellice."

BRITISH AGRICULTURE.

The Pioneers and Progress of English Farming. By Rowland E. Prothero, Fellow of All Souls College, Oxford. Longmans, Green & Co.

The attractiveness, even to a lay reader, of Mr. Prothero's history of English agriculture is, to the economic student, doubled by his masterly presentation of the truth that prosperity is again possible to British farmers through the adoption of improved methods in the production of crops which the needs of the present demand, and impossible if the farmers prefer to "slumber in their empty corn-bins, dreaming of Protection," which at best would perpetuate the use of antiquated methods in the production of crops which American competition has rendered permanently unprofitable.

The author is a conservative, in sympathy with the landed interests. Nevertheless, as an investigator, he has a scientific conscience, and the statistical information in which his volume abounds, but with which his text is never burdened, is not only accurate in detail, but truthful in its grouping. In the first portion of his history, the coloring due to his political bias is scarcely perceptible. The lesson which is here strongly impressed is the value of scientific agriculture, despite the ridicule it receives from those whose range of vision is confined to the largest possible profits in the year just ahead. Every one of the improvements by which the product of English agriculture has been increased seven fold has been received with distrust by the mass of practical farmers. When Lord Townsend, in the middle of the last century, revived the practice of marling and introduced the growing of turnips from Hanover, though he thereby increased the rental of his Norfolk estates from almost nothing to fifteen shillings per acre, it was years before his example was generally followed. "Many persons classed turnips with rats among Hanoverian novelties, and refused their assistance with Jacobite indignation." A similar reception awaited Bakewell's discovery of the principle of selection in the breeding of stock. Before his day, breeding was in general "a promiscuous union of nobody's son with everybody's daughter." Only slowly did farmers adopt his principle, and in breeding use only bulls and rams which possessed the qualities they wished to reproduce. Yet, by the end of the century, the change wrought was so great that the sheep in Smithfield market, which in 1710 had weighed on the average twenty-eight pounds, in 1795 weighed eighty pounds.

It was during the period of these and other improvements which revolutionized agriculture that the enclosure of the commons began. In describing this process the author's conservative bias expresses itself in the emphasis which he gives to the resulting benefits. Common land was practically waste land. It was impossible to make improvements upon it. Enterprising men could take no action without securing the coöperation of their indifferent and ignorant partners. The substitution of individual ownership was necessitated. By the enclosure of the commons the landlords solved the problem of the greatest possible production of wealth; but the problem of its best possible distribution they completely ignored. Mr. Prothero does not attempt to conceal the fact that the helplessness of the agricultural laborer was in many sections increased, and that it would have been well for England had Parliament accepted the recommendation that the lot of the common-field farmers should be rendered as easy as possible "by laying to their cottages a sufficient portion of land to enable them to keep a cow or two." Nevertheless, he does not, like Thorold Rogers and Arnold Toynbee, bring into prominence the "socialism of capital" which the legalized confiscation of the common lands involved. There is nothing to suggest Karl Marx's picture of the Duchess of Sutherland expelling the cotters from nearly eight hundred thousand acres of clan land, and assigning them but six thousand acres on the seashore, where, as an English author with grim humor has expressed it, "they lived half on land, half on water, and withal only half lived on both." There is very little to suggest Toynbee's generalization, that mainly through the self-interested legislation of richer classes during this epoch, rents and interest on capital were doubled, while real wages were reduced nearly one-half.

Yet, in spite of his Conservative bias, Mr. Prothero does not fail to bring out certain facts illustrative of the radical doctrine, recent-

ly expressed in an American state paper, that it is mockery of the people to "propose that the Government shall protect the rich, and that they in turn shall protect the poor." In a chapter devoted to the agricultural laborers, he says:

"Looking back to the period of protection, from 1790 to 1840, their condition was deplorable, a disgrace to civilization generally, and to landlords and farmers particularly. . . . The standard of life from 1800 to 1834 sank to the lowest possible scale; in the south and west, wages paid by employers fell to 3s. to 4s. per week, augmented by parochial relief from the pockets of those who had no need of labor."

Mr. Prothero's entire review of the effect of protective legislation is singularly satisfactory, and singularly full of lessons which one cannot help applying to the situation now existing in America:

"So long as protection lasted, landlords and farmers were unable to resist the gambling spirit which it fostered. . . . Inflated prices raised rentals, and vastly increased the area under corn cultivation. . . . Farmers brought nothing upon their holdings in the shape of costly manures or expensive feeding stuffs; they laid down no pipe for drainage. . . . They themselves were men of little enterprise, . . . farming by rule of thumb and from hand to mouth, investing in no improvements. . . ."

When the corn-laws were repealed, and farmers recognized that the repeal was final, they turned their attention from corn-growing, which did not pay, to stock-feeding, which did pay. Self-help took the place of Government aid. Improved machinery and improved methods were simultaneously introduced. High farming became the rule instead of the exception; and English agriculture entered upon a period of prosperity in which reduced prices were accompanied by production so largely increased that not only wages but rents rose higher than ever before.

In only two instances does Mr. Prothero's sympathy with the landlords lead him into the use of bad logic and doubtful statistics. The chief of these is in the chapter entitled "Protection Taxes on Free Trade Prices." Here, after asserting that rents have decreased 35 to 40 per cent. since 1878, and are now no higher than they were prior to 1834, he insists that justice imperatively demands the remission of taxation on agricultural land, because in the earlier period local rates were offset by protective taxes, and the poor-law was so administered that the farmers' labor bill was paid by the community. The argument refutes itself. If rents are still as high as formerly, it signifies that the net income of the landlord is still as great, in spite of the fact that he no longer has protection and must now pay his own labor bill. His net income being as great, there is no reason why his taxes should not also be as great. There is, on the contrary, reason why his taxes should be greater. In 1814, says Professor Fawcett, 69 per cent. of the rates were borne by land; in 1868 but 33 per cent. The burdens of local taxation upon all other forms of property have steadily increased, upon land they have remained stationary. The other instance in which Mr. Prothero is sophistical in his argument, and more than doubtful in his statistics, is where, after picturing the wretchedness of the French peasant proprietors in a way that suggests Lady Verney, he declares that "it is the travesty of history" to assert that the peasant proprietary of France was created by legislation, inasmuch as it was firmly established before the Revolution. The best French authorities, like Paul Boiteau, author of the 'État de la France en 1789,' estimate the landowners in France before the Revolution at 450,000, 280,000 of whom were nobles and clergy. In 1812 3,799,000 French farmers owned the land which they cultivated.

Apart from the revision of taxation in the interest of the landlords, the remaining legislative proposals urged are in the line of progress and not of reaction. Chief among them are the establishment of a new system of land-transfer and the regulation of railway freight rates by a long-and-short-haul provision similar to that of the Cullom bill. At present, as every one knows, the titles of English estates can only be discovered after a prolonged search into what Cromwell termed "a godless and tortuous jungle;" and if the estate be small, the cost may often equal the purchase money. The need of railway reform is equally imperative. Our author's statement of it cannot be improved:

"Railway companies admit that they carry at a profit hops from Flushing to London for 25s.; therefore this profit must be enormous on the same weight of hops at 36s. 8d. from Sittingbourne to London. . . . Foreign perishable produce is sent through to London in fast trains from which local growers are excluded. . . . Food is cheapened, but only by bounties to foreign producers and premiums on distance at the expense of proximity."

Under no natural system, he maintains, would England import each year fresh meat, butter, eggs, fruit, and vegetables to the value of £30,600,000. It is to the production of just this class of commodities that English farmers must now turn their attention. American competition has permanently lowered the price of grain. But in the production of market-garden and dairy products, rent is by nature unimportant—labor and distance all-important. If English farmers, instead of dreaming of protection, will follow the example of those among their number who are now succeeding in adapting themselves to the new conditions by breaking up the large holdings and using improved methods and improved machinery, they may by self-help again attain a prosperity simlar to that which followed their acceptance of the repeal of the corn-laws. "Twice before English agriculture has changed its front. In the sixteenth century farmers turned from the plough to pasture; in the eighteenth and nineteenth centuries they reverted to tillage. Now, at the close of the nineteenth, live-stock and dairy farming must supersede corn as the farmer's sheet anchor."

RECENT NOVELS.

Leaves from the Life of a Good-for-Nothing. Translated from the German of Joseph Freiherr von Eichendorff by Mrs. A. L. Wister. Philadelphia: J. B. Lippincott Co.

The Romance of a Shop. By Amy Levy. London: T. Fisher Unwin.

Young Maids and Old. By Clara Louise Burnham. Boston: Ticknor & Co.

A Village Tragedy. By Margaret L. Woods. Henry Holt & Co.

Temple House. By Elizabeth Stoddard. Cassell & Co.

The Peckster Professorship. By J. P. Quincy. Boston: Houghton, Mifflin & Co.

The Admirable Lady Biddy Fane. By Frank Barrett. Cassell & Co.

JUST why, at this day, should be translated Von Eichendorff's novelette, long known to schoolgirls and some others, it is hard to say. Probably most of the German reading public have already made its acquaintance in the original, and others will hardly be interested in it. If once they might have been so, it would be in that long-vanished time when Germany was a comparatively unknown world to us, and when its porcelain stoves, and feather beds, and the flea-stuffed sofa of Mary Howitt were novelties. German gushing romanticism is now an old story, yet hardly old enough to possess the interest of an antique. Furthermore, why this slight tale should be published in the bravest apparel, with imposing paper, print, illustrations, and binding, is renewed mystery. Given the fact, however, that there are readers still to be diverted by the sentimental fiddler of the Fatherland, with his yearnings, his pipe, and his spotted dressing-gown, then here is diversion in the fullest sense; this archaic and effusive person may be followed through a maze of adventure, now worshipping Nature, now eating bread and butter, and throughout in love with his lady fair. The work of translation has been admirably done.

The charge of obsoleteness cannot be brought against 'The Romance of a Shop,' which is modern to its uttermost comma. Four sisters, losing their father and their fortune, open a photographic studio, hoping, as one of the sisters puts it, "to become the fashion, make colossal fortunes, and ultimately marry dukes." Their hopes are in part fulfilled, yet the author does not allow the shop unpleasantly to dominate the romance, or make the story an essay in ambush on photography. When Poverty peeps in at the window, Love drives up to the door. The sisters take photographs, read Rossetti, and attend in rusty black what they are pleased to call "smart functions." At the last, one of them is led to the altar by a peer. An old love and a genius have to content two others, while the fourth is reserved for the catastrophe. A catastrophe is of course inevitable in a romance, yet the size of this one is out of proportion with the book and wears a factitious air as of stage thunder. Taken with a good deal that is commonplace in incident, it defaces a book which in style is often sprightly and in tone generally high. The printing and paper are sumptuous.

Within the covers of 'Young Maids and Old' we have not found anything as attractive as the title without. It is a pale story of slender vitality. One old maid has as hobby a nephew; another, as hers, a brother. That two young maids appear upon the scene and capture the nephew and the brother, to the consternation of their lady keepers, is matter of course. Add to this an unpleasant papa, whom even the author could not endure, and early kills; an artist, who is introduced to play the weird part of unsuccessful suitor; and an elderly deacon, who persuades one of the old maids, his early love, to become a matron on the last page, and the story is told. It is throughout perfectly correct, and may safely be sent to the hospitals as innocuous reading for the feeble.

Less cheerful reading for sick or well is to be found in 'A Village Tragedy,' which sets forth a tale of unrelieved misery. Told in a level tone of restraint which well suits the monotonous wretchedness of the story, it is undoubtedly powerful as a presentation of drear forlornness, although, rather than a tragedy, its repulsiveness suggests an almshouse report. Not too gloomy, we must fear, to be photographically true, some of its scenes are hardly fit subjects for art.

'Temple House' is quite as unhappy a book, with less of realism and more of the exaltation of tragedy. Near of kin to 'Two Men,' by the same author, it emphasizes the least agreeable phases of that striking book. It is red with blood and hot with passion, but its throbbing life is so overlaid with unreal forms that men-

tal confusion is produced within the reader, and he is left mocked and exasperated.

'The Peckster Professorship' opens like a society novel. It is, therefore, with a shock that on an early page, while Prof. Ernest Hargrave is helping Mrs. Clara Souford remove to the ice-chest, lest it should sour, "a certain creamy bubbling composition" for "the morrow's flapjacks," we find that we must be serious, and are asked to sympathize in the efforts of this man and woman to found a Professorship for Independent Spiritual Research. Let not the unwary suppose that this is all. The members of the Psychic Research Society are obsolete Philistines beside our Professor and his wife, who lead us a dance. Beginning as witnesses of their experiments for ascertaining the absolute weight of a human soul as it is leaving the body, on through sober assertions of the flight and migration of a human body from one city to another, till we assist at the projection of the spirit into the distance, into the past, into the future—we follow the scent of battle; and when, at last, astral counterparts and the Sublime Brotherhood appear, we are fairly roused to the fact that we are not to stop short of Esoteric Buddhism, with Sinnett, Col. Olcott, and Mme. Blavatsky as high priests. Prof. Hargrave, unlike some of his brother adepts, is hand and glove with science. He occupies a chair of osteology in a university near Boston (what one can be meant?) until this besotted institution decides that he is too much given to chimeras, and abolishes the professorship. He then retires to the Andes to found a brotherhood, where he invents Advanced Exercises for Will Practice, and supplies "vibrating Psychoplasm" for the rhythmic regulation of fury-heated heads in times of social revolution. His wife, once dully superintending flapjacks, now becomes a Sensitive under his influence (exerted, by the way, from Brazil upon her in Boston), and is enabled to float down the waves of time and become a witness of the future. In all this there is so much of burning conviction that, along with Dr. Bense, the ultra-scientist and doubting Thomas of the story, one grows quite credulous. The local color, given by Boston and Cambridge interiors and street scenes, furthers this result, while the constant reference to scientific authorities, mingled with a noble scorn of *mere* science, is for the hour all-convincing. The writing is learned, involved, and laborious. The fact that one is terribly bored by it at times seems one more proof of its reality as a report. Anything so heavy must be true, or why should it exist? At the last, there flames up so warm a moral and spiritual glow that we defy any one to remain quite cool under it. With its affectations, pomposities, preposterousnesses, and kindlings, this strange book leaves one with a sense of having been amused, irritated, fatigued, and exalted.

'The Admirable Lady Biddy Fane' is one of those extravaganzas which at all ages the human mind craves in one or another form. It is not likely to live as a classic, yet to the jaded reader of the bric-à-brac novel it will carry a certain tonic force. After a course of alleged mind analysis, it is a pleasure to go to sea, to be pursued by pirates, to be abandoned on desert shores, to be slain a hundred times by fire, water, and sword, to wander for two years in South American wildernesses with the girl of one's heart, to deliver her safely into her guardian's hands, and to have the double satisfaction of marrying her and of seeing one's foes hanging in a row at the yard-arm. The idyllic part of these wanderings recalls the journey of Consuelo and Haydn. There can be no doubt that the horrors are laid on too unsparingly, yet in its ferocities what unreflecting comfort! The quaint language of Elizabethan times completes its pungency.

The True Story of Hamlet and Ophelia. By Fredericka Beardsley Gilchrist. Boston: Little, Brown & Co. 1889.

If there is any topic on which unrestrained freedom of speech is traditionally permissible, it is *Hamlet's* mystery. Every one has been encouraged to bring the contribution of his own mad wits to its elucidation; and this has gone on so long that it might seem impossible to add new illustrations of the mind's fatuity to those which already enliven the commentary of the play. But he reckons ill who sets limits to the talent man has for fooling himself. For the hundredth time the heart has been plucked out at last, and the question settled. To the objection that this adds only one more to the theories of the play, the author says: "To this I reply—with modesty and an ardent desire to be proven in the wrong if I be wrong—that it seems to me the theory I advance destroys all other theories. For nearly three hundred years it has been possible to misunderstand, not special passages only, but the fundamental intention of the play; during that time no satisfactory explanation of *all* its obscurities has been advanced. I believe this theory explains them." And what is the secret? One wants the key at once. It is found in the lines:

> "O all you host of heaven! O earth! what else?
> And shall I couple hell?"

It seems the punctuation is wrong. The last line should read:

> "And shall I couple? Hell!"

"We know," says the author, "that no fault was more common than the interchange or omission of ? and !; and this I believe is what Shakspere wrote." How simple it is!

The bearing of this remarkable emendation is, that *Hamlet* gave up at once his love for *Ophelia*, and, his young life being thus devastated, the rest of his history is as clear as moonshine. The character of *Ophelia* is, further on, developed as that of a maiden of a sensuous temperament, distrusted by her nearest relatives, and showing in madness the current of her secret thoughts; one who needed only to be tempted to be won; and this has been discerned by *Hamlet*, who, confounded by the weakness of his mother, has had his eyes opened to the nature of woman's frailty. *Hamlet* himself is made out to be less than twenty-one years old. Naturally, the youth, having so suddenly determined not to marry, on hearing the ghost's story, falls into melancholy. It is not true, however, that he had the weakness to contemplate suicide. He never thought of it. The famous soliloquy, "To be or not to be," refers, as a German actor, Ziegler, discovered, and other German critics have agreed, to the question whether or not the play of *Gonzago* shall "be"—that is, be played before the King and Queen. *Hamlet* was not philosophizing, but planning. So the entire text is gone over, scene by scene; and it is clear to the author that there are no difficulties which do not disappear before the formula of "shall I couple?" etc., which is consequently often restated. The old "Hystorie of Hamblet" is used to bear out some of the argument, particularly with regard to *Ophelia*, and is reprinted entire at the end of the volume.

Whether this theory "destroys all others," the judicious will no doubt determine; there is still room to believe that *Hamlet's* love was an incident in a larger life, important in the structure of the action, but dissociated from many elements in the play. *Hamlet's* age is susceptible of discussion, but it is hard to reconcile his mind with his being a boy; and as to the soliloquy, the question raised is preëminently one to be threshed by the class of German critics who evolved it. The emendation made in the lines quoted, on which the author has put an unnecessary and unfortunate emphasis, is likely to have some currency as a curiosity of Shakspere criticism; it is really not essential to the argument, but it is a test of the author's qualifications, and indicates justly enough the eccentric and flimsy nature of the volume.

Truth about Russia. By W. T. Stead. Cassell & Co. 1888.

Mr. Stead's position as editor of the *Pall Mall Gazette* is so peculiar that it is difficult always to distinguish between the writer and the man. It must be said, however, that, so far as Russia is concerned, Mr. Stead's attitude has always been consistent. From the beginning he has sincerely believed that Russia and England were in a false position to each other, and he has therefore tried to present to the English public the Russian side, both official and unofficial, of the questions which have arisen between the two countries. During the dispute about the Afghan boundary, and especially the Penjdeh affair, his was the only English newspaper which was willing to state truly the facts of the case. He was enabled to do this by having access to Russian sources of information. What are the terms of his literary and political partnership with Mme. Novikoff ("O. K."), it is of course impossible to say. This lady, who has a mysterious relation to the imperial family, and who for some years has played the part of an unofficial ambassadress at London, first made her appearance in literature in a series of letters contributed to a small Newcastle newspaper which Mr. Stead was then editing. Since that time she has been looked upon as his Egeria, and was for a time considered even the inspirer of Mr. Gladstone. This lady now writes for the English reviews and magazines, and contributes frequent letters to the *Times* whenever a Russian question crops up. In the book before us Mr. Stead begs the pardon of Mme. Novikoff for daring to differ from her about church questions; for he seems to be an adherent of the Salvation Army, and is indignant at the cold shoulder now shown to that Methodistical, canting Lord Radstock, his convert Pashkoff, and their followers, who were formerly received with open arms by St. Petersburg society as mitigating the asperities of the Russian Lent, when there were no balls and operas, and theatres were shut. Mme. Novikoff, however, has belabored Mr. Stead well for his strictures on the orthodox Church in a recent article in the *Contemporary Review*, entitled "A Cask of Honey with a Spoonful of Tar," in which she exposes his ignorance of Russian affairs when left to his own unguided or misguided investigations and conclusions.

Leaving out the portion of the book which is devoted to religious persecution, and the introductory chapters recounting interviews with Boulanger and Laveleye, and the author's stay at Berlin, where, it is said, Count Herbert Bismarck's indignant refusal to grant him an interview was the cause of the article on the Bismarck dynasty in the February number of the *Contemporary Review*, most of the book is taken up with Gen. Ignatieff and Count Leo Tolstoi. With the former the author had several interviews; with the latter he seems to have stayed a week, and he even dates a portion of his book from Yasnaya-Polyana. The book, on the whole, is entertaining and interesting. It contains much that is true and much

that is new to the general reader. The amateur-like suggestions for reforms and new institutions are rather amusing, especially the discussion of the tribunitial character of the Czar, and the proposal for him to increase his usefulness by becoming the editor-in-chief of a great daily newspaper for treating of the grievances of his subjects.

Popular Lectures and Addresses. By Sir William Thomson, LL.D., F.R.S., F.R.S.E., &c. In 3 vols. Vol. I. Constitution of Matter. Macmillan.

WHATEVER comes from the pen of Sir William Thomson is certain to receive a hearty welcome, not only from teachers and students, but from men of science in general. In this volume we have eleven lectures, or short papers, full of originality, and not wanting in a certain spice of humor. They are not adapted to elementary instruction, but yet are intelligible to well-trained youthful minds, and they have two eminent recommendations: they are interesting, and they are in the highest degree suggestive. Part of their interest arises from their distinctly personal character. The reader listens to the free, off-hand talk of a great master, and not to a formal ex-cathedra lecture. We do not believe that any man of science will rise from the perusal of these papers without a deepening or a shattering of old convictions, and without broader and clearer views of the possibilities of future scientific progress. It is difficult to select any paper as, in comparison with others, most worthy of notice, but we would call attention to the remarkable trains of reasoning in the lectures on the size of atoms, and in those on the sun's heat. We await the appearance of the second and third volumes of these papers with great interest. The volume before us embraces the constitution of matter; the second will include subjects connected with geology; while the third will deal chiefly with phenomena of the ocean and maritime affairs.

Great Captains. A Course of Six Lectures, showing the Influence on the Art of War of the Campaigns of Alexander, Hannibal, Cæsar, Gustavus Adolphus, Frederick, and Napoleon. By Theodore A. Dodge, U. S. A., retired. Boston: Ticknor & Co. 8vo, pp. 219.

COLONEL DODGE has published his Lowell Institute Lectures of the past winter in a very neat and readable volume under the above title. Of course, the limits of a single lecture make the treatment of the career of each of the six "great captains" a mere sketch; but the sketch is given with a freedom of drawing and an eye to perspective which produce a pleasing and vivid picture. The consistent purpose in all of them has been to show that great warriors have been great in proportion as they have possessed that high form of practical intellect which has enabled them to make a science of their work. To rise from courageous and stubborn fighters to clear thinkers as well, grasping what are now recognized as leading principles of the art of war and applying them on a great scale, is presented as the distinctive mark of the great general as contrasted with those of lesser rank. The author shows with clearness that in ancient as well as modern times the criterion of greatness has been the same, and that Frederick or Napoleon succeeded by virtue of principles and intellectual character similar to Alexander's or Cæsar's. The book is adapted to popular reading, and will prove attractive to all who have a taste for military analysis.

Sketches of a Tour through Holland and Germany. By J. P. Mahaffy and J. E. Rogers. Macmillan & Co.

DURING the last few years there has been an abundance of books on Holland. The impression one gets from nearly all of them is, that the country is one great museum of antiquities and oddities, entirely out of touch with modern civilization, except perhaps in a few large cities. The peculiar merit of Prof. Mahaffy's book, in so far as it relates to Holland, is, that while he has an open eye for the picturesque features of the country, he does not devote his whole space to them, but gives his readers a fair idea of the state of religious and political parties and of other subjects of every-day life. His views are generally sound, and (for instance, where he discusses the remarkable fact that political liberalism is nearly always allied in Holland with indifference in religious matters) he shows a clear insight into the peculiar social conditions of Holland. The author evidently is not acquainted with the Dutch language; one of his principal grievances against the Dutch is that they failed to understand him. This ignorance explains his astonishing statement that Holland had no great authors in the seventeenth century. Vondel, Hooft, Huyghens, who would reflect honor on any literature, do not seem to be known to him.

The author feels much more at home in Holland than in Germany. The want of material comfort, as compared with Holland, seems to have irritated him as much as the lack of political liberty, and, consequently, his denunciation of the Bismarckian régime is severe and occasionally flippant. This part of the work is chiefly interesting because it gives a description of a part of Germany rarely visited, viz., the Baltic provinces and some old cities in the interior.

The book is handsomely got up, and the illustrations are of more than average merit.

BOOKS OF THE WEEK.

Balzac, H. Cousin Pons. Frederick Warne & Co.
Bellamy, Mrs. Penny Lancaster, Farmer. Frank P. Lovell & Co. 50 cents.
Bernard, V. F. Le Genre des Noms. W. R. Jenkins.
Brown, W. H. The Slaves of Folly. Chicago: Rand, McNally & Co.
Bryan, Mrs. Mary E. My Own Son. George Munro. 25 cents.
Bunce, O. B. The Story of Happinolande, and Other Legends. D. Appleton & Co. 25 cents.
Burhans, J. A. The Law of Municipal Bonds, including a Digest of Statutory Laws Relating to their Issue. S. A. Kean & Co.
Burke, Edmund. A Philosophical Inquiry into the Origin of Our Ideas of the Sublime and Beautiful. Scribner & Welford. 60 cents.
Burton—Pringle. The Processes of Pure Photography. The Scovill and Adams Co. $2.
Campbell, Helen. Under Green Apple Boughs. Illustrated. Boston: Ticknor & Co. 50 cents.
Chambers's Encyclopædia. Vol. III. Catarrh to Dion. New ed. Philadelphia: J. B. Lippincott Co. $3.
Chambers, F. H. Fun and Fact. J. S. Ogilvie.
Cheyne, Prof. T. K. Jeremiah: His Life and Times. A. D. F. Randolph & Co. $1.
Colgnet, Clarissa. Francis the First and His Times. Translated by Fanny Tremlow. Scribner & Welford. $5.00.
Dale, A. A Marriage below Zero. G. W. Dillingham. 50 cents.
Davy, E. M. Jack Dudley's Wife. Chicago: Rand, McNally & Co.
Deane, H. Daniel: His Life and Times. A. D. F. Randolph & Co. $1.

OLD BOOKS, CATALOGUES ISSUED. GEORGE P. HUMPHREY, Rochester, N. Y.

The Nation.

NEW YORK, THURSDAY, APRIL 4, 1889.

The Week.

PRESIDENT HARRISON has now made appointments to the leading foreign missions. In order to show them in comparison with those made by his predecessor, we arrange them in parallel columns:

	Cleveland's Appointments.	Harrison's Appointments.
Great Britain.	E. J. Phelps.....	Robert T. Lincoln
France.....	Robert M. McLane.	Whitelaw Reid.
Germany	Geo. H. Pendleton.	M. Halstead.
Russia.....	G. V. N. Lothrop...	Allen T. Rice.
Austria	A. R. Lawton.....	Fred D. Grant.
Italy.....	John B. Stallo.....	Albert Porter.
Spain.....	J. L. M. Curry.....	T. W. Palmer.
Chili	Wm. R. Roberts...	Patrick Egan.

We think it will be admitted by most Republicans that Mr. Cleveland's list represents a higher level of intellectual culture and attainment than Mr. Harrison's, and consequently that the standing of the country abroad, in so far as it depends upon the quality of our diplomatic representatives, will be somewhat less distinguished in the next four years than it has been in the past four. This is not true in all particulars, but it is true in the average, and is what Republicans of discernment are saying to each other to-day.

The appointment of Mr. Robert T. Lincoln for Minister to England is highly respectable. It fits in with the spirit of reverence which all Americans hold for the name of Lincoln. It goes side by side with the appointment of Col. Fred. Grant for Minister to Austria. Both nominations, if we look upon a foreign mission as "something to get," are admirably bestowed. But upon any other theory we must be allowed to say that a better choice might have been made in either case. Mr. Lincoln is not one of the foremost lawyers in the country. He is a respectable lawyer, but many degrees inferior to Mr. Phelps as a representative of American culture and intellectual power. This is no disparagement to Mr. Lincoln, who is still a young man who has his spurs to earn. There are other members of the Chicago bar who would have filled this place to better advantage. Still, Mr. Lincoln will, if he accepts the place, make a creditable ambassador.

Nothing could be more absurd than the talk of some thoughtless editors about the Senate's action in the case of Mr. Halstead being an attempt to "muzzle the press." On the contrary, it is the confirmation of an editor's nomination which muzzles a newspaper, and his rejection which removes the muzzle. This is strikingly demonstrated by the contrast between the present attitude of the New York *Tribune* and the Cincinnati *Commercial Gazette*. The *Tribune's* editor was nominated for Minister to France and confirmed by the Senate. The result is, that the *Tribune* has no opinion to express on the most important events of the day, like the selection of a Minister to England, and has had not one word to say on the action of the Senate in the Halstead case. On the other hand, the editor of the Cincinnati *Commercial Gazette* was nominated for Minister to Germany and rejected by the Senate. The result is, that this journal is expressing its opinions on all questions of the day with a freedom and emphasis not surpassed by any other member of the press.

We would not be understood as implying that the course of the journal controlled by the Minister to France is improper. Its silence when criticism might be expected is simply a recognition of the duty of the place-holder, which of course, under the circumstances, far transcends in importance the prerogative of the editor. Whitelaw Reid as a private citizen might and ought to express his views about the Administration with the utmost freedom. But Whitelaw Reid as Minister to France is himself a part of the Administration, and it would be both indecorous and unjust for him to find fault with his superiors. While not legally an impeachable offence, it would be morally a gross breach of all the proprieties for a mere official inferior such as Whitelaw Reid, Minister to France, now is, to express views about his official superiors such as Whitelaw Reid, private citizen, might and should express. Nobody need fear any harm to "freedom of the press" from such an event as Mr. Halstead's rejection. It is the confirmation of the Whitelaw Reids and Allen Thorndike Rices which really muzzles the press.

We observe with genuine sorrow that Col. Elliott F. Shepard's depression, caused by the Administration's foreign appointments, is increasing. It has been with extreme difficulty that he has been able to comment upon the selections for the French, Austrian, Italian, and Spanish Missions; and when those for the English, Russian, and German came along, he was only partially equal to the emergency. He had a few cold, formal words of approval for Messrs. Lincoln and Halstead, but for Mr. Rice nothing but silence. Why speech should have failed him in the presence of the good fortune of this fellow editorial thinker, we can, of course, only surmise; but we infer that it was because of a conviction that in some way the selection of Mr. Rice emphasized the cruel neglect of himself more strongly than that of any one else could have done. Both men had come into the ranks of the party thinkers in the same way; and, however religious the Colonel's continual contemplation of the Scriptures may have made him, he was obviously unable to see, when one was taken and the other left, why he should have been the one overlooked.

President Harrison has not yet made any changes in what may be styled the accounting department of the Government. Secretary Windom, having had some experience under a previous administration as head of the Treasury, doubtless understands the true functions of the auditors and comptrollers, and is presumably disinclined to urge the removal of these officers merely to give their places to "workers." Even if we cannot fully agree with the declaration made by Mr. Madison in the debate of 1789, upon the bill organizing the Treasury, that the comptroller should hold his office by a tenure independent of the executive branch of the Government, and even if we cannot imitate the example of nearly every country of Europe by establishing a permanent court of accounts, consisting of eminent magistrates holding office by a stable tenure, all who have any knowledge of our Treasury system must admit that the officers charged with the settlement of public accounts, the adjudication of claims, and the control of those who receive and disburse the funds of the Government, do not fall within the class which ought to be changed with a change of administration. These officers are not in confidential relations with the heads of departments; on the contrary, they are a check upon their expenditures. After the incessant friction of many years, it was declared by law that the balances stated and certified by the auditors and comptrollers upon the settlement of public accounts should not be changed or modified by the heads of departments, but should be conclusive upon the executive branch of the Government, subject only to revision by Congress or the proper courts. This law, enacted in 1868, ended the struggle of eighty years—a struggle which Madison had foreseen—and resulted in securing the independence of the accounting officers, so far as their judicial duties are concerned, of even the head of their own department.

An admirable description of what an auditor or comptroller should be was made in 1855 by Mr. Guthrie, who came into closer relations with these officers than did any other Secretary in recent times, and whose administration was so able and painstaking that its benefits are experienced to-day in every bureau of the Treasury. "To constitute a good auditor and a good comptroller," he said, "requires legal ability of a high order, a special knowledge of our fiscal and disbursement laws and regulations, coupled with unabating industry, unbending integrity, and promptitude of decision." If there be any one now in office with these qualifications, he ought to be retained; and if removals are made or vacancies in any way caused, President Harrison cannot do better than to apply rigidly the tests above mentioned to every applicant for the place of auditor or comptroller.

The well-informed correspondent of the Philadelphia *Ledger* telegraphs the positive

statement that Mr. John Field has accepted the offer of the Philadelphia Post-office, and will be appointed to the position. Mr. Field is a merchant of the highest standing, who was an active member of the Committee of One Hundred organized to break up the infamous Republican ring which disgraced the city a dozen years ago, and has always been so much of a Mugwump as to bolt any nomination of his party which he considered unfit. He will accept the place on the distinct understanding that the office is to be run on business principles. The selection of a business man of the Field type to succeed a mere politician as Postmaster of Philadelphia, will naturally be held to involve the defeat of the effort now making to supplant with a mere politician the Postmaster who has so long conducted the New York office on the very principles which Mr. Field represents. Simultaneously to appoint John Field and dismiss Henry G. Pearson would be acts of flagrant inconsistency.

Secretary Tracy continues to lay down rules regarding his proposed conduct of the Navy Department which the public will remember, and by his adherence to which he will be judged. Politicians of the "Al" Daggett type have been talking loudly about making Brooklyn a Republican city through the use of the navy-yard patronage, and behaving generally as though this branch of the Federal Government were to become simply a part of the Republican machine. Secretary Tracy appears to have become tired of this, and authorizes the Washington correspondent of the Brooklyn *Eagle* to say that he is "unalterably opposed to Federal interference in State and municipal elections"; that "such experiments in the past have reacted disastrously upon those engaged in them"; that while regarding the approaching municipal campaign in Brooklyn as one of great importance, he does not intend that the Navy Department shall interfere in the slightest degree; that "the navy-yard will not be used to promote the election of any candidate for office"; in short, that "the good of the service, not the requirements of the political situation, is the thing to be considered." These are admirable sentiments to utter, but the people will only be satisfied with their execution.

The disaster at Samoa ought surely to furnish food for reflection to the believers in special providences, for it looks like supernatural mockery of the fuss the three Powers have been making over these unfortunate islands. The Germans have some commercial interests in them, and the British have possibly some political interest in them, because they are really, geographically considered, Australian dependencies. But what interest have we worth the sacrifice of a naval squadron and fifty lives? It is almost an accident that the ships have not been lost in a naval engagement with the Germans, for a hot-headed officer might at any moment during the past three months have precipitated a conflict. The only excuse for our being there at all is the suggestion of somebody, ten or twelve years ago, that it would be a good place for a coaling-station, and that we were in great need of one in that part of the Pacific. But in order to have a coaling-station it is not necessary to keep a fleet there. We have a concession for the purpose at Pago-Pago, on the other side of the island, where there is, we believe, a decent harbor, and, having this, all we needed to have whatever coal we wanted was to contract with a respectable coal-dealer to deposit a certain number of tons at that point, and put a storekeeper in charge of it. Nobody has disputed our right to this coal station, or questioned the propriety of our keeping coal in it. The fleet has not been collected there for that purpose. It went to support our Consul in a dispute with the Germans, the merits of which nobody clearly understands. Our trade with the island amounts to nothing, and can never amount to anything under our present tariff, if under any. The Germans and British would beat us on the spot, even if Auckland, which is only five days distant, were not the natural market for residents on the island. That we have any political interests to look after in an island 6,000 miles distant from our nearest frontier, worth the exposure of our navy to the risks from which so many gallant men have perished, will not be seriously maintained. The island is a dangerous place, as we see, in time of peace, and it would be still more dangerous in time of war.

Another serious outbreak of race prejudice is reported from Ohio. New Richmond, a town of 3,000 inhabitants in Clermont County, has about 700 white school-children to 300 black. After the repeal of the "black laws" two years ago, and the consequent throwing open of the public schools of the State to children of both races on equal terms, the negroes of New Richmond were persuaded to have their children kept in separate rooms, and thus virtually allow the old line of distinction to be maintained. But one negro, James Ringeld, decided to insist upon his rights, and sent his children into a room occupied by white children. The little negroes were abused and made miserable in every way, and finally Ringold appealed to the courts to protect him and them, suing the Superintendent of Schools and thirteen prominent citizens for $5,000 damages. On Thursday last the Circuit Court decided in his favor, giving him one cent and costs. This showed the negroes generally that they could legally send their children into the rooms occupied by white children, and they did so on Friday. Great excitement resulted, and so much disgust was expressed that on Saturday the School Board closed the schools for the remaining three months of the school year, as the only way out of the difficulty. The situation is thus described in a despatch to the *Times* of March 31: "This has been one of the most exciting Sundays the place has ever known. The streets have been crowded all day. All other topics were forgotten. Ministers counselled forbearance, and wise heads attempted to calm the impetuous. Each side professes to fear violence from the other. All the teachers will sue for their salaries for the remainder of the term, and costly litigation, if nothing else, is sure to follow. There is a prospect that a mandamus will be asked for in the morning to compel the School Board to reopen the schools."

These outbreaks of race prejudice in Ohio (for the New Richmond incident is only the latest in a long series) may well be associated with the alarm now felt by the intelligent and well-to-do white citizens of Topeka, Kan., lest their city shall be bankrupted by the votes of the poor and ignorant negroes who flocked thither a few years ago; and with the unanimous protest of the whole Republican press last winter against the proposed admission of New Mexico as a State, because of the ignorance of the white inhabitants of that Territory — ignorance not so dense or widespread as that which prevails among the blacks in Southern States. All these incidents serve to illuminate the Southern problem, and they ought to show the most partisan the need of charity. Hereafter, when we hear of some abuse of a Southern negro by a Southern white, let us recall how negro children have been treated by whites in more than one Ohio town; when we find Southern whites complaining that the unrestricted rule of the blacks would involve the community in financial ruin, let us think of Topeka's complaint; when we are told by Southern Democrats that the control of a Southern State by its majority of ignorant blacks would be intolerable, let us remember that the Republican party of the North refused to allow the majority of ignorant whites in New Mexico a share in the government of the Union because such an idea was intolerable.

The "exodus" of negroes from North Carolina is assuming large proportions. The most striking feature of the movement is the fact that most of the emigrants go to Arkansas, the State where the Clayton murder recently occurred, and where, according to Republican organs, the negroes are allowed the enjoyment of no rights. This would seem to indicate that the average negro does not care much for the reputation of a State or the opinion of a Republican organ. The simple truth about the "exodus" is, that it is a melancholy illustration of the credulity of the race, most of the misguided people who are leaving North Carolina having swallowed all the stories of the promoters of the movement about Arkansas being a land flowing with milk and honey.

A project is said to be on foot to establish a chair of Protectionism in Yale University on an endowment of $100,000. Undoubtedly the money can be raised. Protectionism can do almost anything that calls merely for cash. Leaving to the President and Fellows of Yale the question whether protectionism is a science distinct from political economy, or whether, being within the purview of political economy, it can be taught by one professor as true, and derided by another as false, we have a suggestion to make to the contributors of the endowment fund. This

is, that they shall define Protectionism in the terms that they are willing to stand by and "bet their money on." This is the more necessary, since the writings of Prof. Robert Ellis Thompson, the only professor of protectionism that we know of, are at variance in many important points with the teachings of more recent instructors, whose speeches adorn or encumber the pages of the *Congressional Record*, and are especially at variance with the last Chicago platform. If an agreement can be reached as to the meaning and definition of protectionism, we could put our hand on the right man for the professorship at once. We should choose above all competitors Mr. Allen Thorndike Rice. Mr. Rice signalized himself as a professor of Protectionism in a remarkable article in the *North American Review* for October, 1888, entitled "Maxims and Markets," in the course of which he threw off the jewel of thought that this country resumed specie payments by fiat or legerdemain, or in some way peculiarly American, thus silencing a great English statesman and political economist who couldn't understand how the thing was done.

The demand of the Aldermen to be allowed to participate prominently in the Centennial celebration destroys the last lingering hope of making it anything of a pageant, or keeping the social or ancestral element in any way prominent in it. It is now plain, and it ought to have been plain from the beginning to old New Yorkers like the members of the Committee, that to attempt any great public ceremony in this city, without making it wholly political or official, was to attempt the impossible. It would have been impossible even if there were in the city any "society" whose claims to distinction in the proper sense of the term could withstand even the criticism of an Alderman. But the most ignorant Alderman in the Board would have no difficulty in "making hay" of any extended lists of "first families," which any "society leader" would draw up, that was based on anything but money; and when it comes to comparing purses, the Alderman, of course, likes to be present and have his say. There is a certain number of historic families in New York who, on the historic plan, ought to be represented on an occasion like this, but the moneyed families do not acknowledge their preëminence, and will not yield the *pas* to them; and why, then, should the Aldermen, every one of whom may be, for aught we know, the father of a young man who will "lead the german" ten or fifteen years hence, and grumble over the presence of "the ignorant foreigners"? We trust the discords now impeding the preparations may be overcome, but they will only be overcome by the hearty and ungrudging acceptance of the democratic principle, and the offer of a cordial welcome to both the Legislators and the Aldermen.

The proposal of the French Government to prosecute Boulanger for a "conspiracy against the State" is one of the sink-or-swim resolutions which are usually interpreted as a sign of desperation. The prosecution of a man who has a large body of voters at his back is a doubtful experiment in any State, and particularly in France, where people so readily take up with a would-be dictator. It is not possible to punish him in any effective way without killing him, and no Government nowadays likes to kill a political opponent. If he is not killed, the chances are ten to one in favor of his becoming a martyr. The trial and imprisonment of Louis Napoleon in 1840 undoubtedly helped him on his way to the Empire in 1851, and if the French Government, instead of expelling the Comte de Paris, had seized him and locked him up, it would have done a good deal for the restoration of the monarchy. That Boulanger has been plotting and intriguing against the Republic, there is no question—in fact, he confesses it himself; but the trouble is, that a very large body of voters think he did right. M. Vacherot, who is not a bad observer, writes a forecast to the *Figaro*, which seems to have a great deal of wisdom in it. He says the election which will take place next fall will doubtless send up a strong anti-Republican majority, but that when Boulanger steps in to claim the benefit of it, the Bonapartists, Legitimists, and Conservatives generally will laugh at him, and will find themselves in exactly the same situation as in 1876, when they had to keep the Republic going because, as M. Thiers said, it was that which divided them the least. In other words, it is one thing to use Boulanger and break into the house, and another to install him as master.

Gen. Boulanger's "plan," over which there has been more or less fun, as he was said to have deposited it with a notary, is leaking out gradually, and has the merit of extreme simplicity, if it has no other. His supporters are not as reticent as he, and they, therefore, cheerfully justify their hopes. They say that he is to get a majority at the fall elections in the Chamber, and when President Carnot proposes to form a ministry, every member of the majority is to be forbidden to take office under him. Should he then seek a Cabinet in the minority, it is to be overthrown by a hostile vote on the first day. Then, after many fruitless efforts, he is to resign, as MacMahon, and Thiers, and Grévy did, and Boulanger is to be elected in his place, after which we are to see what we shall see.

The Tories have all along suffered from the want of a competent leader in the House of Commons. The gentleman who fills that place, Mr. Smith the newsdealer, is a sort of Wanamaker, who has much money and a good deal of business ability, but no oratorical power whatever. This want is painfully felt on ceremonial occasions like that of Friday, when the usual tributes were paid to John Bright's memory by the various party chiefs; all others being, by immemorial and most salutary usage, condemned to silence. Gladstone is, of course, always great and graceful at such times; and though his touch has undoubtedly grown heavier through age, he had in this case the inestimable qualification for the task, of long friendship and close intercourse with the departed worthy. Disraeli, who was always good on parade, did well in elegiac oratory, but broke down under the strain put on him by having to speak for the Opposition on the Duke of Wellington in 1851, and stole bodily, and applied to the Duke as his own, a passage from Thiers's History about the French General St. Cyr. He never quite recovered from this. Palmerston was very neat in this sort of work, but never put any feeling into it, and it needs feeling to be effective. His best effort was a tribute to Cavour which charmed the Italians. No harder task of the kind has ever fallen to any one than Mr. Gladstone in eulogizing Disraeli, whom he knew to be a charlatan, and who had grossly abused him personally, but he acquitted himself well. Who can take his place in functions of this sort, it is hard to say. The Tories are not likely to supply anybody, the Tory temper being especially hostile to effusiveness. John Morley has more promise in this direction than any of the younger men.

The latest news from the Argentine Republic shows little relief in the financial strain under which that country is laboring. Gold is at a premium of fifty-nine, with the tendency upwards; so that specie payments must still be remote. The late readjustment of the Cabinet is largely due to the pressure of the monetary situation. The Minister of the Interior, Dr. Wilde, resigns, and his place is taken by the late Minister of Finance, Dr. Pachico, who in turn is supplanted by Señor Barela in the Treasury. Minister Pachico has complained bitterly of the extravagance of some of his colleagues, notably of the Minister of the Interior, and his transfer to that office is taken to mean a determination to institute some of those economies which he has been maintaining were entirely feasible. The new Minister of Finance signalizes his accession by moving in a matter of great importance. The law guaranteeing the bank notes in circulation did so on condition that they should be withdrawn if depreciated more than 20 per cent. A banking commission has charge of the execution of this law, but has taken no steps to enforce it, although the notes are now depreciated as much as 30 per cent. Minister Barela now calls for prompt action, threatening direct Government intervention unless something is speedily done. As the customs duties are payable in the depreciated currency, while the Treasury must meet many of its obligations in gold, the reasonableness of the Secretary's position is obvious. There is no lack, however, of great apparent prosperity on the part of banks and the large corporations. Most of the annual reports show large profits. The Banco Nacional, for example, did a business of $2,500,000,000 in 1888, and distributed profits at the rate of 18 per cent.

THE SENATE AND THE PRESS.

THE explanation of Mr. Halstead's rejection given by his colleague, Mr. Richard Smith, in his own paper, is that it was due to his denunciations of the Senate for its refusal to investigate the mode in which Senator Payne obtained his seat in that body, and that the general violence of his language towards other persons and on other subjects had really little or nothing to do with it. We may concede this to be a just and reasonable explanation, without going quite so far as Mr. Smith would have us, and anticipate the abolition of the Senate as a result of its treatment of Mr. Halstead. It is certainly a view which has a great deal to support it in recorded facts, and one which, for the credit of journalism, we are very willing to accept.

But if well-founded, what a strong argument it furnishes against editorial office-seeking. The Senate, as well as every other legislative or administrative body in a free country, must always remain, and of right ought to remain, exposed to newspaper criticism, and sometimes to newspaper denunciation. To watch the Senate and comment on its proceedings in terms of censure, when the occasion calls for it, is one of the most important functions of the American press. Any editor who failed to do it would fail in one of his duties to the public. That he should do it sometimes in language of unnecessary violence, and that in doing it he should sometimes be unjust to particular individuals, is what we must expect, and for the most part forgive, as long as editors are human and have to do battle for their party.

On the other hand, too, as long as Senators are human, we must expect them to resent criticism of any kind with more or less warmth, and especially criticism which they feel to be unjust. Senators so calm and judicial-minded, and so sensible of the value of an unbridled press, as to welcome editorial denunciation of their own corruption, or ignorance, or selfishness, are hardly to be looked for in our time. In truth, if this kind of man presented himself for election to any Legislature in the country, the chances are that he would be rejected peremptorily as too good for ordinary political work.

Our United States Senators, in fact, like our State Senators and Representatives, and like our editors, are the natural products of American society in its present stage of progress. They are men of like passions with Mr. Halstead and Mr. Richard Smith. They hate their enemies, love their friends, and curse those who despitefully use them and persecute them, with Homeric freshness and simplicity. For this very reason, no editor who seeks to do his duty to the public by exposing their corruption or incapacity should ever put himself in a position to ask favors of them. When Mr. Halstead undertook to expose the frauds of the Payne election, and accused every Senator who opposed the investigation of being influenced by "boodle," he should have well understood that his action made it impossible for him to beg for office at the hands of the men on whom he had cast imputations so odious. If his words were not meant to be taken seriously, they ought not to have been uttered. If they were meant to be taken seriously, he ought to have expected that the persons at whom they were aimed would resent them by any legitimate means. To have confirmed Mr. Halstead as fit to represent the Government to a first-class Power would have been almost an endorsement of his charges—that is, an admission that he was a trustworthy and careful man, who weighed well his utterances and did not make accusations lightly.

The remoter effects of this affair on the relations of the press to the Senate, if party editors continue to be office-seekers, cannot fail to be serious. Editors who are looking forward to foreign missions or consulships when their party comes into power, and have their hearts set on getting them, will, after Mr. Halstead's sad experience, certainly be very careful how they handle the Senatorial body. They will avoid making even justifiable reflections on Senatorial integrity, and will be disposed to let Senatorial delinquencies generally go untouched, sooner than offend Senatorial sensibilities. In fact, a better warning to the ambitious members of the editorial fraternity than the rejection of Mr. Halstead could hardly have been devised. But we think, if the Senate was justified in its action in this case, it is bound to carry its regard for the decencies one step further.

If it be its duty to protect its own dignity against editorial assaults, it is also its duty to protect the dignity of other branches of the Government. If it would have been improper to send to represent this country abroad a man who has spoken of the American Senate as Mr. Halstead has done, it is also improper to send abroad men who have spoken of the President of the United States as Mr. Reid has done, and of the American Secretary of State as Mr. Thorndike Rice has done. The appearance as diplomatic representatives at foreign courts of two persons who have described the highest officers of their own Government in the terms employed by these two worthies, is something which we think has not been witnessed in the civilized world except after a revolution. Whatever Mr. Cleveland's faults have been, he was the President of the United States for four years, during which Mr. Whitelaw Reid was daily covering him with coarse abuse and ridicule. During this same period Mr. Bayard was the member of the Cabinet who represented the nation in its communications with foreign Powers, and while in this position he was made the object of an elaborate and blackguard personal attack by Mr. Thorndike Rice. Now, we do not go so far as to maintain that editors guilty of such conduct should get no office at home under the new Administration, although we think President Harrison would do much both for public and private morality if he made this a rule. But we do maintain that the Senate ought to see to it that the authors of such national disgrace are not sent to represent us abroad. It ought to see that respectable and patriotic Americans who go to Paris or St. Petersburg are not confronted while there with descriptions published by their own Ministers at these capitals, in which the two leading officers of their Government are described as mountebanks, louts, ignoramuses, and impostors. Any protection of dignity against ruffianly editors which the Senate can command, is just as much due to the Executive as to the Senate itself, and we may add that, inasmuch as the President is, in his relation to foreigners, always the same person, President Harrison would have shown more respect for his office if he had refrained from sending to represent this country abroad coarse revilers of his predecessor.

NEGRO CONVICTS IN SOUTH CAROLINA.

THE official statement of the pardons granted by the Governor of South Carolina during 1888 throws a good deal of light on the fate of negroes accused of crime in the South. It is sufficiently startling to be told that of the 894 convicts in the South Carolina penitentiary 843 are colored, and it savors a bit of slavery to find that of the 70 negroes who were subjects of executive clemency during the year, 25 were serving life sentences and 13 others terms of imprisonment of ten or more years; but when the reasons given for the pardons are heard, we find a state of things hardly credible in a civilized community.

The first case in the pamphlet is that of a negro convicted in January, 1876, of grand larceny, and sentenced to one year in the penitentiary; in November, 1887, he is pardoned because he has served his sentence, and is needed as a witness for the State in an important case. How long he would have remained in prison but for this case, we have no means of judging. On p. 16 is the case of two colored children, aged nine and ten years, who were sentenced to imprisonment for life for burglary and larceny of articles not exceeding ten dollars in value. They pleaded guilty and were sentenced without trial. On the same page is the case of Horace Darby, sentenced for life for a similar offence. After allowing him to serve five years in the penitentiary, his prosecutors ask for his release "on the ground that the amount stolen was trifling and the prisoner was very young, and too young to know the gravity of the offence." Thomas Coker, "a small boy" induced by older men to set fire to a building, was sentenced to fifteen years' imprisonment; after serving nearly seven years of his term, he is regarded as sufficiently punished and is pardoned. Another boy of twelve, sentenced for life for arson, is pardoned after six years "on account of his extreme youth." In still another case, "a mere child, perhaps not over ten or twelve years of age," who asserted he was induced by two older boys to break into a house, was allowed to remain in prison a year before he was pardoned. The Supreme Court of the State has recognized the universal rule of law that children under fourteen are presumed to be incapable of committing crime, and that this presumption can only be rebutted by strong and clear proof of criminal intent in the child (State vs. Toney, 15 S. C., 409), but the in-

ference is strong that in actual practice the fact of color overrides all presumptions.

In July, 1883, Pleasant Austin, colored, "stole about ten or twelve pounds of flour," and was sentenced therefor to imprisonment for life; in February, 1888, his sentence is commuted to imprisonment for five years on the ground that he has been sufficiently punished. There seem to have been mitigating circumstances in the case of Joe Whitmire, who was sentenced for only five years for stealing "some bacon and flour which he needed for his wife and children who were in a starving condition." He had asked a store-keeper for a short credit, and, on being refused, came by night, and, finding the door of the store insecurely fastened by a chair pushed against it, took a small quantity of provisions, but nothing else, although there were a great many other articles in the store. After four years' imprisonment, having "in the judgment of the petitioners, some of the best citizens of Union County, suffered enough," he is allowed to return to his wife and children, assuming, of course, that they have not died of starvation in the meantime.

It is evident that efforts have been made to impress the negro with the majesty of the law. Prince Williams, while a slave, had a wife, although no slave marriage was recognized by the law, and this wife seems to have disappeared, sold perhaps in slavery. At any rate, Prince married again in 1878, and, after living with this wife for ten years, was prosecuted for bigamy, slave marriages having been validated by the Legislature. Immediately on his conviction the prosecuting attorney has the grace to recommend his pardon, stating "that the main object of the prosecution was to vindicate the law on account of the salutary effect upon the people of his race." Dick Ellerbe has reason to be grateful for executive clemency. He was sentenced for life after having been induced "to plead guilty, while in liquor, by a white man." His eight children are helpless and destitute, as both mother and grandmother have died during the imprisonment. The petitioners, "persons of prominence," firmly believe that Dick will make a good citizen if released, and he will be allowed to return to his family, or what may be left of it, next October.

Nor must the negro be allowed to think that the law can be trifled with. Certainly Eli Moore does not think so; he was sentenced to ten years' imprisonment for manslaughter. Eight of the jurors who tried the case ask for his pardon on the ground "that there is reason to believe that Moore did not do the shooting, and that it was done by a white man who left the State immediately after the shooting, and did not return until after the trial." It apparently did not seem worth while to trouble this white man by ascertaining the truth of the matter, which was adjusted by a commutation of Moore's sentence from ten years to five.

There are several cases in this report which go to show that the State is quite ready to dispense with the formality of the actual commission of a crime by a negro in order to secure his services as a convict. Andrew Glover, colored, was sentenced to twelve years' imprisonment for arson. He was convicted on circumstantial evidence of previous threats, and of footprints found near the burned premises which were "very similar to tracks made by the defendant." On the other hand, fifteen or twenty witnesses swore positively that, at the time the fire was discovered, Glover was at church some two miles away. After three years have gone by, "some of the best and most highly respected citizens of York County" request his pardon. In 1877 Capers Allen, also colored, was accused of murder. His employer at once came forward and testified that the prisoner, who was quite young, was four miles away when the murder was committed. Subsequently, the boy was rearrested without his employer's knowledge, tried, and sentenced to be hanged, the sentence being commuted by Gov. Hampton to imprisonment for life. The employer has made repeated efforts to secure his release, but not until eleven years have gone by is he finally successful. James Stowe was sentenced to be hanged for setting fire to a store in which no one slept. A petition, signed by all the prominent members of the Yorkville bar, states that Stowe was convicted on his own confession, and that "he did not himself set fire to the building, but was on the watch for other parties who did the firing." His sentence was promptly commuted to imprisonment for life at hard labor.

The difference between the treatment of white and black is strikingly brought out on one page of this report. A negro was pardoned after serving fourteen of a thirty years' sentence for manslaughter because the crime was committed under great provocation, and there was a very bitter feeling against the prisoner at the time. In the other case, a white man was sentenced for five years for a like offence. At the end of a year a petition for his pardon is presented from all the jurymen who tried the case, from the relatives of the murdered man, stating that it was the wish of the deceased that the murderer should not be prosecuted, and from the inevitable leading citizens. The prosecuting attorney joins in the petition, naïvely adding that he promised the prisoner's attorney at the trial to recommend a pardon at the end of one year. This seems to have been such a pleasant, friendly murder that the scruples of the prosecuting attorney in thus waiting a year are hard to understand.

The method by which the administration of the law is kept impartial to all, white and black alike, is ingenious. The statute punishing burglary, for instance, prescribes imprisonment for life as a penalty, but with an important proviso that if the jury recommend the prisoner to mercy, the punishment shall be reduced to imprisonment for not less than five years. This allows juries to recommend white offenders to mercy, while the negroes suffer the full penalty of the law.

It is to be noted that the cases we have cited are but a few selected from a large number, and that there are other cases in this official report fully up to the standard of justice established in those we have given.

THE STORY OF OKLAHOMA.

WHO are the Oklahoma boomers, and why are they so eager to get into Oklahoma? These are questions which many newspaper readers are asking, and the facts necessary for intelligent answers to these questions make an interesting story.

Oklahoma, in the language of the Chickasaw Indians, signifies "beautiful land." It was the name given by the Indians to a tract of country containing almost two million acres and situated nearly in the centre of the Indian Territory. Some of the land is poor, but the larger part of it is the richest and most productive known in the world. It is also believed to contain valuable mineral deposits. It was originally a part of the Louisiana purchase, and was included in the tract assigned by Congress in 1830 to be divided up among various Indian tribes, to be theirs for ever. Oklahoma under this act of Congress became the property of the Creek tribe, and remained in their undisputed possession till 1856. In that year they made a treaty with the Seminoles by which the two tribes held the country jointly till 1866, when the two consented to a sale of it to the United States for about fifteen cents an acre. A few months after this sale was completed, a bill was rushed through Congress granting to the Atlantic and Pacific Railway a right of way through the territory thus purchased, together with a grant of alternate sections of land for forty miles on each side of the railway. It was then generally believed that the purchase of Oklahoma had been advocated and accomplished with a view to giving the railway company this valuable grant. The company made a survey for the proposed line, but never built it. It was decided by the courts that the land was not yet open to settlement, and would not be so thrown open except by proclamation from the President of the United States. It was expressly provided in the railway charter that it should be forfeited if the officials of the company in any way aided or abetted any movement for the opening of the Indian Territory for settlement. If they built the road without settlers, it would be a losing venture; if they attempted to get settlers along its line, they would lose their charter. What should be done under these conditions?

Here we get a glimpse of what is generally believed to be the first cause of the boomers. They were men hired secretly by the railway company to break into Oklahoma, in defiance of the United States Government, and found settlements. This is denied by the railway authorities, and can, of course, never be proved. There were undoubtedly other causes, the chief of which was the richness of the coveted lands, and the desire of men of roving and adventurous spirit to get possession of them. The first band of boomers started under the leadership of an Indiana adventurer named Payne, who, having served through the war and got into politics, first heard of the Oklahoma country while serving as assistant doorkeeper in the House of Representatives at Washington. He went to

Kansas in the fall of 1878, and began to harangue the people on the subject of invasion and possession. In company with other men of similar characteristics, he organized a land company with an alleged capital of $2,000,000, called the "Oklahoma Town Company," and sold shares at five dollars each. They also organized the "Southwest Colony Company," with a capital of $1,000,000, and sold shares in that at two dollars each. After vigorous agitating they succeeded in getting together, in the spring of 1880, about twenty-five men who were willing to begin the invasion.

After dodging the United States troops for several days, they at last reached a suitable point in Oklahoma, and chose a site for their town. They called it "Ewing," after Gen. Thomas Ewing of Ohio, gave it an area of six square miles, built a log-house, and began to cut down trees and lay out town lots. They got on famously for about three weeks, when a squad of United States troops, consisting of twelve men and accompanied by twelve Indian scouts, appeared and took away the entire population to prison. After two weeks' imprisonment, Payne and his companions were discharged. They found themselves heroes, for the West looked upon them as sufferers from the despotic power of the Government. Payne soon discovered that he could now obtain all the followers he desired, and in the fall of 1880 he had a new expedition of 200 men in camp on the Kansas border, eager for a fresh invasion. The troops were watching them, however, and there were thus organized two hostile camps near the border, which were the beginnings of the remarkable boomer settlements which exist there to-day.

From the autumn of 1880 till that of 1884 there were invasions at pretty regular intervals. Squads of boomers would slip by the troops, invade Oklahoma, locate lands, be discovered by the troops and ejected, only to start again. The largest expedition ever organized by Payne was in May, 1884, when he got into Oklahoma with a colony of 600 men, women, and children, and founded the town of Rock Falls. He opened a "drug store," with a license to sell liquor, had a provision store, a schoolhouse, a printing-office, and a newspaper, and established regular religious services, there being a parson among the colonists. This colony was so large that it required time to get together a sufficient expelling force, and it was not till August following that Payne was again arrested and his town broken up. He was kept in prison only a short time, and was busily at work organizing a fresh expedition when death overtook him. Other leaders followed him, however, and the business of invading Oklahoma has gone on, with constantly increasing force, until the present time, where there is upon the border line a series of towns, containing at least 10,000 "boomers," all waiting for the time to come when they can rush in and take possession of the coveted land.

They can take possession legally on the 22d of the present month, when, under the recent proclamation of the President, the new Territory of Oklahoma will be thrown open for settlement. This is in accordance with an act of Congress creating the new Territory out of certain lands which the Government has acquired by purchase from the Indians. The Territory thus formed contains much more than the original tract of Oklahoma, which embraced less than 2,000,000 acres. It extends from the Canadian River to the Kansas border, and northwesterly as far as No Man's Land; and its total area is estimated at some 23,000,000 acres.

There is probably nowhere else in the world such a curious collection of settlements as are now stretched along the border lines of the new Territory waiting for the 22d of April to arrive. They have regular names, like Beaver City and Purcell, with hotels and stores. Some of them have a population of 1,500, and at one store the gross receipts in a single day are said to have reached $500. Yet there is scarcely a permanent building in any of them. One town is famous for having a plastered house in which the railway agent lives. For the most part the boomers are living in dug-outs, or sod houses, with some rough wooden shanties and many tents. Yet business is carried on regularly, and there is a scale of rentals ranging from $5 to $25 a year. Clothing is the most difficult thing to obtain, and the 10,000 boomers who are thus waiting on the threshold of the promised land are clad more like Indians than civilized people. In addition to these 10,000, there are said to be many thousands more in the regular towns and settlements near the border, and it is estimated that the new Territory may have a population of 100,000 a few months after it is thrown open for settlement. The rush is ominous for the remainder of the Indian Territory, for the same greedy eyes are upon that as have been fastened so eagerly upon the portion about to be gained.

EDMOND SCHERER.

THROUGH the death of M. Edmond Scherer, France loses one of her wisest writers on public affairs, and on the whole—now that Sainte-Beuve is gone—her solidest critic. Although seventy-four years old, M. Scherer was still physically robust, and one might still even say intellectually young, for he had in a marked degree that capacity which sober, inquisitive, and judicial minds sometimes possess, of rejuvenating themselves by an unflagging interest in facts and an untiring impulse to see things in the truest light. Subjective natures, as Goethe says, soon speak out their little inner store, and run to decay in mannerism. M. Scherer long ago outgrew that possibility, and for years past has stood for the best type of the Liberal, as distinguished from the Radical, in politics, and of the man of reason as distinguished from the man of temperament in literature. Persons as scholarly as he, and as free from all sentimental illusions, are apt to lack energy in practical affairs, because they see so many sides to every question. But Scherer had none of the scepticism of the dilettant, when it came to concrete problems. Since France became a republic, few of her citizens have had more resolute opinions about public matters, or exerted a more salutary influence by voice and pen, whether as deputy, as member of the "Commission pour la libération du Territoire," as Senator, or as journalist, in the columns of the *Temps*.

His fibre was much more moralistic than that of most members of the literary class in France. His Protestant blood and training had probably much to do with this, while his education in England and Germany gave him a judgment whose genuine cosmopolitanism was in strong contrast to that curious "note of provinciality" which always strikes *nous autres* in the writings of the Parisian brotherhood to which he belonged. His early interests were theological. He was, in fact, for five years Professor of Exegesis in Geneva, and his contributions to the *Revue de Théologie* and to the *Bibliothèque Universelle* have been republished in his two volumes of 'Mélanges de Critique et d'Histoire.' But he formally broke with orthodoxy in 1850; and though we find him occasionally going back to the old fields, as in his excellent essay on Hegel, or his wonderful chapter on Mohammed, or here and there dropping into pure speculation for a page or so, secular history and literature became more and more exclusively the subjects of his pen.

Matthew Arnold, in his essays "A French Critic on Milton" and "A French Critic on Goethe," has made extracts from Scherer which give a very good notion of his merits. On the whole, no one has written more adequately of Milton than this Frenchman, no one more justly of Byron, no one more truly of Goethe—provided always that it be admissible to write analytically, critically, and judicially of artists and poets at all. For, *mutatis mutandis*, that is always true which Mr. Lewes wrote in a passage quoted by Arnold, after giving Scherer's remarks on Goethe's "Egmont": "When all is said, the reader thinks of *Egmont* and *Clärchen* and flings criticism to the winds. These are the figures which remain in the memory—bright, genial, glorious creations, comparable to any to be found in the long galleries of art!" Nobody has more charmingly spoken of the inadequacy of the merely critical point of view than M. Scherer himself at the end of one of his articles on Renan. But grant that point of view, and he is always masterly. He has in a superlative degree the faculty for which Arnold praises us Yankees, of "thinking straight." He makes immediately for the vitals of his subject, and the essential and the unimportant range themselves with singular clearness under his pen. Philosophic training has doubtless much to do with this. Add the unfailing French literary form, wit, freedom, variety, copiousness, and exactness, and there is no living master of English, except Mr. John Morley, who in critical writing can be compared with him at all. Among the French one can only think of Renan and of Taine. Taine is of course more powerful, but far less flexible and sane. Renan has flexibility enough, in all conscience, but no solidity. How neatly, by the way, M. Scherer says the most cutting possible thing of him, in a sentence written long ago:

"Sa grande préoccupation, c'est l'idéal, c'est le devoir, c'est le bien des âmes. Mais M. Renan, en prenant cure d'âmes, ne risque-t-il pas de tomber dans un nouvel extrême? *Ne nous offre-t-il pas ce que personne ne lui demande?*"

It was not so easy in 1860 as it is now, when M. Renan's principles are in a state of liquefaction, to see him to be no genuine moralist, but only an artist working with a moralist's palette: an incomparable artist, it is true, and one whose gift of *magic* the soberer Scherer never shared!

How *can* a critic, a serious critic, have any

magic? Criticism and magic are "incompossibles." The greater and more important the subject, the more, as M. Scherer somewhere says, does he feel "la nécessité des distinctions et des réserves," and the colder and more pedagogic is he liable to appear to readers who perhaps are "genial." In looking over M. Scherer's many volumes of 'Études sur la Littérature' once more, we must confess to having ourselves but just now got a slightly desolate and bleak impression from the impartial telling of truths which there prevails. His pages are a sort of foretaste of the day of judgment—an occasion from which no urbanity in the form of the proceedings, we may be sure, will ever dispel all constraint and gloom. His whole philosophy was austere—the Genevese overtopped the Parisian. He ended in absolute agnosticism. "Pessimism," he says, "has no more place in true thinking than optimism has. Both are equally subjective, equally impertinent manners of looking at the world." And again, apropos of a sentence of Sainte-Beuve about human life:

"'Fugitive illusion traced for an instant on the ocean of universal illusion!' Is it then in those terms that the experience of the centuries sums itself up? Must humanity repeat for ever the *vanitas vanitatum* of the ancient sage? . . . And why not? If there be any greatness in the reed which feels its weakness, is there none in a vanity which knows itself for what it is? Has any man tasted without secret joy the bitterness which comes from going to the bottom of things? And after all, when once illusion knows itself, is it illusion still? Does it not in a manner triumph over itself? Does it not attain to the sovereign reality, that of the thought which thinks itself, that of the dream which knows itself as dream, of the nothingness which ceases to be such by being conscious, and affirming what it is?"

Rather rarefied cheer, to be sure; and an unfair specimen to quote where we are quoting so little, for Scherer was invariably sincere, and this (by a rare exception) is purely rhetorical stuff. But the *form* of it, at least, is consolatory, and, empty as it is, it pretends to be a *rally*.

Although there are fortunately pure philosophers still in France who have kept their faith in the nature of things, an absolute atheism appears to be the doom of all purely literary Frenchmen in these latter days, and the outcome of their hopeless view of life is expressed now in levity, now in cynicism, now in despair. Scherer, to his credit be it said, never dropped out of the moral attitude. He never wrote a really enervating word, and that in Paris is a great distinction *par le temps qui court*. But our pen has (half fortuitously) run into so sombre a track that in justice to M. Scherer we must leave off with a different note. Many passages we might quote, witty, delicate, profound, but our space is at an end. To show how genial and charming M. Scherer could be also, let this description of what he calls the "gastronomic idylls" of Erckmann-Chatrian suffice. 'Twould spoil it to translate:

"Nous sommes introduits ici dans un monde d'appétits et de jouissances dont nous n'avons aucune idée de ce côté des Vosges. Quelle cnère, grands dieux! Quelle vie plantureuse! Quelle cuisine et quels estomacs! On ne voit que teints fleuris, mentons rebondis, serviettes autour du cou. Il semble que la table soit toujours mise, la cave toujours ouverte. Les buffets gémissent sous les mets succulents. Les cuillers plongent dans des soupes épaisses. Ce sont de toutes parts des poissons énormes, des rôtis gigantesques, des entassements de saucisses et de choucroûte. Puis vient toute l'armée des pâtes et des pâtisseries alsaciennes. . . . On arrose tout cela des meilleurs vins du Rhin et du Palatinat. Après le vin, les choppes innombrables; avec la choppe la pipe au long tuyau et à la vaste cheminée. Ainsi passent les heures. On lâche peu à peu les boutons de son gilet. On rit d'un gros rire franc. Une certaine onction religieuse se mêle à cette goinfrerie: chacun, tout en se caressant la panse, rend grâce au Seigneur de ses nombreux bienfaits. Tels sont les repas qu'aiment nos écrivains; telle est la solide trame de vie animale sur laquelle ils brodent leurs scènes de mœurs bourgeoises et leurs sentimentales amourettes. C'est frais comme une cave, c'est coloré comme un état de boucher, c'est confortable et pacifiant comme le réfectoire d'une abbaye féodale."

ARIZONA AS A STATE.

PRESCOTT, March 15.

THE acts of Congress which have just admitted four of the Territories into the Union, at one time included Arizona as a possible State. It does not seem likely that the latter will come in at present. Even if Congress had passed an enabling act this session, and left the question to be decided by the Territory, popular sentiment is certainly against the proposal. A Territory with an area of 113,000 square miles and a population of 70,000 cannot be called anything but very thinly settled. Arizona has only ten counties all told. The division and establishment of counties everywhere in this country follows pretty closely the growth of population and the legal needs of a people; and a Territory with three counties nearly as large as Maine, and the rest about the size of Connecticut, must be considered of a rather low political organization.

These facts reflect themselves in the popular opinion that a State government would now cost more than its worth. The political enthusiasms of Arizona, like those of other Southern States, are apt to be rather abstract and extreme, but they do not yet go the length of disregarding so hard an argument as this of dollars and cents. So the proposal of Statehood falls rather flat, except with a few elderly politicians, who feel that they are fitted to adorn the Senate Chamber of Congress without further delay.

But even if Arizona does not enter the Union with the Dakotas, the event is only put off for a little while. If the present policy of Congress continues, party politics, either on one side or the other, will soon force the responsibilities of Statehood on all the Territories. It may not be uninteresting, in view of this, to ask what kind of a State this one of the furthest Southwest will be, what peculiar manner of men and political morals it will add to the nation.

In a most suggestive article on "The American Commonwealth," in an early number of the *Political Science Quarterly*, Prof. John W. Burgess deprecates this creation of any more States out of the territory west of the Rocky Mountains, at least for a long while. Following Webster, he regards this territory as the Asia of our country. He sees here the chief dangers which, if not checked by stronger forces, make for the dissolution of the Union. It is separated from the Central and Eastern States by the natural boundary of the Rockies. But the peculiar topography and climate of these high desert plains and mountains separate them still more definitely from the level, fertile valley of the Mississippi and its tributaries. The only occupations possible on any extended scale are mining and grazing, both of which tend to produce a system of manners and morals, personal and political, entirely unlike those of agricultural communities. Here, too, are found those alien elements of race and religion, the Chinese and the Mormons, with whom the nation is already struggling.

Among these possible causes of political alienation pointed out by Prof. Burgess, Arizona is yet happily free from the last one. Her neighbors on all sides have each their peculiar problem of a population hostile or indifferent to American institutions. California has the Chinese, Utah the Mormons, and New Mexico a large Mexican population, but Arizona is not yet troubled by any of the three. The Chinese have not made their way here in any great numbers, and are lost in the much larger white population. They fall naturally into such employments as they seem specially fitted for—cooking, washing, kitchen-gardening, driving pack-trains, or placer-mining on a small scale. As there are scarcely enough of them to fill these positions, their presence excites no hostility on the part of the laborers, who look upon them with much contemptuous good nature. On the other hand, the Chinese themselves are certainly more enterprising than those of California. Most of them have adopted American dress, and all are quick to pick up American business ways. In all cases they insist on as high wages as the white laborer. I know two among the few who have worked for me who have taught themselves to write English. It is true that it is very amusing and very poor English, but as they have picked it up by themselves, in the midst of unremitting manual labor, it seems to me to show an unsuspected adaptability on their part. Altogether, the Chinese are as little a political problem for us as the negro is in New York or Massachusetts. As to the Mormons, although they have a few settlements in the southern valleys, the great natural boundary between Utah and Arizona of the Grand Cañon of the Colorado acts as an effectual bar to any large immigration. This is aided by a pretty determined public opinion, which a few years ago promptly convicted and imprisoned several polygamists. The Mexican population also is not large, and is confined to the south. Although the Spaniards very early crept up the valley of the Rio Grande and occupied Santa Fé, they made no headway against the Apache, who was the master of Arizona, but have waited for the Americans to clear the way.

But without these foreign populations to differentiate her from the East, the climate, formation, and scenery of Arizona make her really a foreign country. It may be true in a geographical as well as a political sense, that the whole Western plateau is the Asia of this country, but it is more true to say of Arizona that it is a part of the highlands of Mexico. There is the same dry, thin, clear air, balmy in winter and parching in summer, there is the same striking paucity of animal life and abundance of venomous reptiles. The flora, with its many forms of cactus and strange fantastic growths of the desert, is peculiarly Mexican and unlike that of the East or Northwest. To gain any clear idea of the geographical formation, one has to put aside Eastern experience. There the plains begin at the seashore, and slope gradually upward to the rolling country, into which they merge imperceptibly; the rolling country runs back a hundred miles or so, and gives place almost as imperceptibly to the mountains. Here there is no rolling land. The whole country is a great plain, out of which the mountains rise abruptly in chains or groups. You can stand on the summit of one of these ridges and look off for two hundred miles across a great sea of plain, out of which the mountains, singly or in masses, rise like islands. Yet the comparison is not perfect, for this vast plain is not all at the same level, like the surface of the ocean. Often on crossing a mountain chain one finds that the plain on the other

side is five hundred, perhaps a thousand feet higher than the one just left. These higher tablelands are the *mesas*. Here snow falls in winter, and some rain in summer, and they are covered with the tall, scattered wild grasses which the cattle feed upon. Higher up and further north, they may be covered with pine forests. On the lower plains there is neither tree nor grass. There is the cactus, clumps of dry, harsh, swordlike plants and thorny, stunted bushes about waist high, but besides these nothing but sun-baked sand.

Nevertheless, these lower plains or deserts have a great advantage over the higher mesas. The rivers that wind their way through them run upon the surface of the ground, like the Mississippi or the Hudson, and when they carry water all the year, it can be drawn off for irrigation and the desert turned into a wonder of blooming fruitfulness. On the higher plains scarcely a stream runs upon the surface of the earth. Every little creek, which a man can step across even at its flood, is in its "arroyo" or wash, fifty or a hundred feet below the surface; while the greater rivers, like the Colorado, flow silently and uselessly away in their cañons, a thousand or five thousand feet deep.

The occupations of the people can be easily inferred from these geographical features. On the low, irrigated plains are the farmers; on the higher mesas and in the mountain valleys, the cattlemen; and all through the mountains, the miners. A strange farming is this, with irrigation. No watching the skies in torturing fear of drought or flood; at the proper time a head-gate is opened in the canal, and so many inches of water allowed to flow over the ground for so many hours or days. Strange crops, too—olives; grapes, to be made into wine or raisins; alfalfa, a thick, rank clover with two, three, or even five crops a year. It is all foreign, Mexican or Italian. But the farmers themselves are not very foreign; they are the same men that settled the Central States, that pushed on into Texas, that are now filling up the Northwest. They are pioneers from Eastern farms, or immigrants from Europe, who perhaps have stopped awhile in Minnesota or Kansas and failed. They work the farms with their own hands, struggle helplessly with the great railroads over rates, and in too many instances wear away an unhappy life under the money-lender's 2 per cent. a month.

Far away from these fruitful plains are the cattlemen. Wherever, in the valleys of the mountains or at their foot where the mesas begin, there is a stream of living water, a cowboy's ranch will be found. The word "ranch" suggests, perhaps, a group of neat, white adobe buildings, protected by a high adobe wall, hidden in fruit and shade trees, and surrounded with waving fields of wheat or barley. In Arizona it seldom means more than a muddy drinking hole for cattle, often in the summer time not more than ten feet across, with half-a-dozen cottonwoods about it, a rude log-cabin or house of unplaned boards, without a fence or crop of any kind. The farm is the wild grass of the mesa or the oakbrush on the mountain sides, fed upon by all the cattle of the adjacent ranches mingled together, and the ranch is merely the watering-place where the animals come in to drink once a day.

When one speaks of the mines in Arizona, he does not generally mean the great dividend-paying lodes, with their shafts a thousand feet deep and their hundreds of miners, organized like an army, delving away in the bowels of the earth. Of course, Arizona has its great mines, where the hundred-stamp mills pound deafeningly away at the ore day and night, Sunday and week-day, month in and month out. But, by the miners, it is more likely that he means the men who are scattered all through the mountains prospecting for mines or working small veins of ore alone or with one or two partners. By miners he means Jim Thompson, who has five men at work on his new find over in Bradshaw basin, or old Jack Smith, who, with one partner, has been working the "Blue Lead" since 1872. Of course, they all hope to "strike it rich" in a few days or weeks and produce a Comstock; but meanwhile they are working away in little camps of two or five or ten, "making grub" or "fair wages," or perhaps a little more.

This, then, is Arizona as we see it. At present there is no foreign element large enough to form a special problem. There are not many large cattle companies nor a great many large mines. A population of Americans is scattered widely and thinly throughout the Territory on farms, ranches, and small mines. Everything seems favorable to the growth of a strong American, almost a New England, civilization, except the physical features of the country. These are all foreign: a parched soil or mountains rugged beyond description, a thin electric air, a cloudless, rainless sky, summer six months of the year. Will the country conquer the men and produce a race alien to its brothers of the East, or will the men conquer the country and plant a commonwealth truly American? So far, Congress has chosen and shaped its institutions, but when once this fostering hand is withdrawn and the Territory becomes a State, its future development rests with itself alone. Will the State of Arizona in the end be American, or Mexican, or what? If the experiment is successful, there will be men who will ask why we should stop here, when our manifest destiny is so clearly pointing out the road to Mexico. If the experiment fails, the limits of the United States on the south are probably drawn once for all. It will be proved that the political institutions of this American Government are peculiarly adapted to temperate and northern countries rather than to southern; to agricultural and manufacturing, rather than grazing and mining communities.

I do not attempt to predict the final result. The country is too new, the people too lately come from older and settled States, to make any predictions worth much. One notices many of the virtues and vices of a scattered frontier people—hospitality, generosity, improvidence, recklessness of life and limb, careless independence and good nature. The gambling houses and saloons are plenty and prosperous, the churches very scattered and poor. But these are peculiarities which will wear away with time. On the other hand, Arizona has one of the best and most expensive common-school systems in the country. I believe that it is true that she spends more money on schools *per capita*, and pays higher salaries to teachers, than any other State or Territory. It is a strange sight, after riding all day across a trackless desert or through almost impassable mountains, to come suddenly upon a little schoolhouse, with children playing about the door and the ponies that are to take them home picketed out upon the mesa. There will probably not be a dozen scholars in all; the law says that no new school shall be established without at least ten "census children" in the district, or continued without an average attendance of five. The land around the school-house is as barren as the mountains over which you have just ridden, for there are no farms or crops to show any evidence of civilization, and the scattered ranch-houses are very likely hidden away in distant coves or gulches. The school-house itself will probably be the only evidence of the presence of mankind in the wilderness. Altogether this is a sight not common in all frontier countries. It is not Mexican, but truly American, nor is it likely to wear away with time.

As to the direct effect of the climate, there has not been time enough to test it. Few men have been here as long as twenty years, and the most thriving towns of the south are scarcely ten years old. Even a cloudless sky, a summer six or eight months long, a temperature of 110° day after day, cannot do their full work in a single year. And yet one cannot help but notice, among all but the latest comers, an indolence, a peculiar indifference, a certain relaxation of the physical and moral fibre. No one works very long or very hard unless under special stimulus. The ranchman's labor is compressed into one or two months of the year, and his life the other ten is one of easy indolence. The miners need the promise of a great fortune to keep them at work at all. Even the "booms" of the great irrigated valleys of the south have something unreal about them. The booms of Californian cities and those of the Northwest have a real energy behind them, however unsubstantial the results may be. The business men organize, advertise, send out lecturers and boomers, charter excursion parties, build huge hotels—all is energy, rush, and confusion. *We* rather talk about what a rush there would be if we should do these things, and encourage one another to go ahead and boom.

Of the relaxation of personal morals it is somewhat more difficult to speak; yet no one can deny that the bonds of business and personal morality bind but lightly in many cases. We do not respect a man the more because he has lent himself to a barefaced swindle in regard to a mine, and thereby made himself rich, but we look on him with a sort of amused indulgence. So in politics, we realize that the little biennial Legislature, with its upper house of only twelve members, is very corrupt; we even know how much this or that member got for a particular bill; but we do not so much as discuss how the evil might be remedied. In private life we have very few wife-beaters, or men who are anything but very liberal towards their families. So long as husband and wife live together, it is likely that they live in comfort and mutual affection. But should the husband go away to another town, or should the wife have been left back East a few years ago, when the man first came out, it is very possible that he will forget ever to go back. In this lotus-land it is so easy to forget.

But none of these criticisms go very deep. I have wished rather to emphasize Arizona's political problem as a whole. We are apt to forget that each of the great Western Territories has an individuality of its own. We know that New York is not Massachusetts or South Carolina, but we lump together one-third of the whole country as the "Territories," or the "Great Western Plateau." But Arizona will soon be called upon to try a political experiment that has not been tried before. Texas and California are both agricultural States; Nevada, Utah, Montana, and the rest are Northern States. New Mexico's politics are further complicated by the presence of a large foreign population. In Arizona we have the simplest factors—a Mexican country and climate, industries chiefly mining and grazing, an American population. What result will Arizona the State work out of these elements?

W. G. B.

MARSHAL VILLARS.

PARIS, March 21, 1889.

THE Marquis de Vogüé is a member of the section of the Institute which is called the Académie des Sciences Morales et Politiques. He was, during the Presidency of Marshal MacMahon, the Ambassador of France at Vienna. He is publishing now, for the Society of the History of France, the authentic text of the life of Marshal Villars, written by the Marshal himself. But while thus engaged, he has written two volumes under the title of 'Villars, from his Correspondence and some Inedited Documents.' The correspondence with the Elector of Bavaria, with Mme. de Maintenon, and with Prince Eugene of Savoy has been largely used in this work, and the correspondence with the Elector has even been given *in extenso*. M. de Vogüé has had access also to the Archives of Count Törring, where he found the correspondence of the Elector Max Emanuel with Count Monasterol, his envoy at the Court of France — a correspondence which furnishes many valuable details on the memorable campaigns of Villars in 1702 and 1703. He has used, further, some of the Ormond papers. James Butler, Duke of Ormond, who commanded the English army in Flanders after the recall of Marlborough, left many papers which finally passed into the hands of M. Severne, and were sold at public auction in London, November 5, 1886. As for the Villars papers proper—that is to say, those which came from the Castle of Villars—they are in the possession of M. de Vogüé, with the exception of a few which are in the Archives of the Castle of Vaux, now owned by M. Sommier.

Saint-Simon was very hard on Villars, and it is impossible to deny that the opinions of Saint-Simon are gradually becoming, more or less, the judgments of history. He gives us many interesting details on the family of Villars, and the relations of his father (who was the grandson of a *greffier* of Condrieu), with Mme. Scarron, who became Mme. de Maintenon. The famous Villars was sent to Vienna as Ambassador, and married on his return Mlle. de Varangeville, who had a large fortune. He was ordered to join Catinat with a large detachment of the army of Flanders and crossed the Rhine—a bold operation which Catinat had refused to attempt; he made the crossing at Neubourg, near Huningue, received the attack of Prince Louis of Baden, thought himself lost for a moment, but gained the victory and was appointed Marshal of France on account of it. The King sent him a package on which was written, "M. le Marquis de Villars." Inside was a letter, in the King's own hand, subscribed to "my cousin Marshal Villars." Villars, who knew the value of Mme. de Maintenon's friendship, had been careful to send the news of his victory of Friedlingen by the Comte d'Ayen, the nephew of Mme. de Maintenon, though D'Ayen had taken no part in the battle.

"Good fortune, an extraordinary good fortune," says Saint-Simon, "served him all his lifetime. He was a sufficiently tall man, brown, well made, fat in after life without being heavy, with an open physiognomy, apparently and really a little mad, with corresponding gestures. An unmeasured ambition which stopped at nothing; a high opinion of himself, which was shared by nobody but the King; a great servility and suppleness towards whoever could help him; himself incapable of loving or serving anybody, or of any feeling of gratitude. Brilliant valor, great activity, unequalled audacity, an effrontery which bore everything, with an excessive vanity which never left him. . . . Under the magnificence of a Gascon, he concealed an extreme avarice, the avidity of a harpy, which made him get mountains of gold stolen during the wars, and, without any shame, making pleasantries on the subject, ordering detachments himself for plunder, directing the movements of his armies for that object. Incapable of any detail on the questions of subsistence, forage, marching, which he left to his subordinates, always taking to himself the honor of the result."

I take only a part of this long portrait, the most important part; but Saint-Simon insists on Villars's love of cards, on his immorality; he tries in every way to show that he owed everything to his servility to Mme. de Maintenon, to the infatuation of the King, and to his luck. Generals cannot be always lucky; Villars may have had more luck than others, he also had a dash, a boldness, a clearness of view, which by some may be considered equivalent to genius. It is clear that M. de Vogüé takes this view of him; he writes less as a moralist than as an historian, and judges by the results more than by the inducements and motives. He shows well the place which Bavaria had at the time in the affairs of Europe, and, generally speaking, his book bears the mark of the diplomat. The Electorate of Bavaria stood between the rival houses of France and Austria; the house of Bavaria might have played in the affairs of Germany the part which the house of Savoy played in our century in Italy. The Bavarian Princes had not the spirit necessary for the accomplishment of great destinies. Max Emanuel, with whom Villars had constantly to deal, was brave, he had a passion for war, but he had none of the qualities of the general. Louis XIV. had great views for him, wishing to oppose him to Austria, to place the house of Wittelsbach as high as the house of Hapsburg; but Max Emanuel did not enter fully into these views. He had received an Italian and French education, and did not much like to live in Munich, which was then a city of brick and wood. He spent most of his time in hunting, in the numerous pavilions of his forests. He tried to ape Louis XIV., and began at Schleissheim a colossal Versailles which he could not finish.

After having crossed the Rhine at Huningue and gained the battle of Friedlingen, Villars had to effect his junction with Max Emanuel; but the Elector was already afraid of his ally, and began to negotiate secretly with Austria; he wilfully missed the occasion of joining Villars, who was much irritated, reëntered Alsace, and made his winter quarters at Strasbourg. In the spring he crossed the Rhine again, and besieged Kehl, which he took; he crossed the Black Forest, and this time he joined the Elector. He planned a march on Vienna, but the Elector found fault with his arrangements, and an expedition to Tyrol was decided on. Marshal Vendôme was to join Villars in that mountainous district, but, being slow, did not arrive in time; the Tyrolese rose against the French and the Bavarians, as they did in the beginning of our century against the troops of Napoleon. Villars was obliged to intrench himself at Dillingen, his communications were cut. The Prince of Baden combined a great attack and a concentration of forces against Villars and Max Emanuel; Villars and the Elector, instead of uniting their action, and notwithstanding the danger of their situation, disagreed, and quarrelled constantly. Villars asked finally to be recalled. At that very moment he gained the victory of Höchstädt, which was very glorious for him and gave confidence to his army. This victory did not reëstablish harmony between himself and the Elector. Louis XIV. had finally authorized Villars to bring back his army to France, and invited Max Emanuel to treat with the Emperor. He sent Tallard to help the movement of Villars across the Black Forest. The victory of Höchstädt changed these plans; Tallard was sent to Landau, and Villars was relieved of his command, which was given to Marshal Marsin.

A new mission was given to Villars, the pacification of Languedoc, where the Protestants were in insurrection. It must be acknowledged that in this difficult and painful task Villars showed much moderation. I have spoken recently of his rôle in Provence, where M. de Grignan was governor, and of the negotiation of Villars with the chief of the Camisards, Jean Cavalier. In a letter to Mme. de Maintenon, who was his great protector, Villars says: "The King did me the honor to say, when he honored me with his last orders, that if I gained him two battles on the frontier, I should not render him a greater service than if I ended a revolt on which his enemies based great hopes. It is ended, and this good fortune accrues to me after the taking of Kehl, the passage of the Black Mountains, and a battle well gained in the heart of the Empire. I do not speak of what preceded these small services. They alone can contribute to my elevation. I do not expect it from any intrigue at the court, but from your goodness and from the opinion which I flatter myself his Majesty has formed of me."

We must pass rapidly over the campaign of Villars in the valley of the Moselle in 1705, in Alsace and in Germany in 1706 and 1707, in Savoy in 1708. The campaign of 1709 was marked by the battle of Malplaquet (September 20), one of the bloodiest battles ever fought in Flanders. Villars wrote to the King: "The enemy can say that they gained the battle, as they remained on the battle-field, but your Majesty's army has truly gained it, by reason of the prodigious number of deaths caused among our enemies." The allies lost 22,000 men, the French lost only half that number. Prince Eugene and Marlborough had found in Villars a foeman worthy of them. Louis XIV. chose to adopt the version of Villars, and made him a peer of the realm. He understood that words have their power, that it was necessary to maintain the prestige of the army. Villars had been wounded; he came to Versailles as soon as he could be transported. His journey was a triumphal march. At Versailles the King gave him the apartment of the Prince of Conti, and made him a visit. The whole court was at his feet. Mme. de Maintenon showed him the greatest attentions.

In the following campaign in Flanders, Marlborough and Eugene gained some small advantages; Villars was obliged to go to the waters of Bourbonne for his wound. In 1711, negotiations were opened with England, pending which Louis XIV. forced Villars to remain on the defensive. At the end of the year, Marlborough left for England, where he was called in the defence of his political interests. France was in a very critical condition; Eugene was now the only commander of the allied forces, but he was a very able commander, and Louis XIV. saw his kingdom ruined, his dynasty struck by repeated blows. The scene of his adieu to Villars at the opening of the campaign of 1712 is not forgotten: "God punishes me," said the proud old King; "I have richly deserved it; but let us forget our domestic sorrows, and see what can be done to prevent the misfortunes of the State." He confided to Villars the supreme command, asked him what he should advise him to do, if his last army was beaten, and if the road of Paris were open to an invasion. The Marshal remained silent. "Well," said the King, "I will tell you what I think: I know the river Somme; there are some fortified places on it—Péronne, St.-Quentin; I would go to some of those places, bring together

my last troops, make a last effort with you; we would die together or save the State, for I would never allow the enemy to approach my capital."

Villars saved France at Denain, and Eugene was obliged to evacuate the French territory. The peace of Utrecht was signed soon afterwards. Villars met Eugene again about the diplomatic table at the Congress of Baden, and they signed together the general peace of 1714. M. de Vogüé speaks with fewer details of the latter part of Villars's life. Villars remained happy to the end; his luck was almost a quality, as it inspired him and those who were round him with confidence. Saint-Simon says that this insolent good fortune disgusted him with history. Villars died on June 17, 1734; Eugene survived him only two years.

Correspondence.

IOWA PROHIBITION—ELECTION LAW.

To the Editor of The Nation:

Sir: The prohibitory law makes itself felt now in this part of the State chiefly in two ways. The Supreme Court has decided recently that the sale of cider is illegal if the cider contains a trace of alcohol, even though it be not intoxicating. The decision does not probably disturb the farmers, as Iowa raises but few apples. Our Mayor issued the following notice: "All parties selling beverages of any kind are hereby cautioned that they must obey the law, which prohibits the sale of all beverages containing alcohol. This includes cider as it is now sold. I will prosecute all parties continuing its sale after February 20, 1889." A similar warning was given by the County Attorney, who is reported two weeks later as saying: "I gave that notice that those who were selling the article and who did not wish to violate the law might dispose of their stock. Some have become very huffy over it and continue to sell. My next notice to them will be an official one."

There is at present no legal sale of intoxicating liquors for any purpose in this city or county, and has been none since October 1, 1888. Previously there were in our city two or three permits to sell for medical and mechanical use. But the revised law in the interest of prohibition cancelled them all, and now allows them to be issued only under more stringent and burdensome conditions. "There are no pharmacists in this county holding permits to sell intoxicating liquors," says our county auditor under date of March 13. "We have no permit-holders in the county." The county contains more than 500 square miles and 20,000 inhabitants. Alcohol and intoxicating liquor can be imported from another State by any individual for his own use, now that our law forbidding importation has been declared void by the United States Supreme Court. It would be presuming to say that all which is now used in the county is that imported, but certainly there are no legal sales.

A more generally acceptable experiment for the last three years has been a law relating to elections. A registration of voters is made in all cities which have a population of 2,500 or more. For each voting precinct registrars are appointed, one from each of the two leading parties at the preceding election. The voter appears before them, answers questions as to such matters as birthplace and present and last previous residence, which are recorded, and he then signs his name. The registry is completed several days before election, and no one is allowed to vote whose name is not down. The registrars meet, however, on election day to add the name of any one who has become qualified by age or length of residence since the day of registration, or who was then out of town, or whose name has been improperly struck from the list. The registration lasts for four years, the list being revised before each annual election. On election day no one is allowed to loiter within a hundred feet of the polls, or solicit a voter or offer a ticket or display his own. Tickets are sometimes left on a stand near by. The only persons who remain at the polls are the officers and the representatives (not exceeding three) of each party. The law has worked well; the operation of voting is now as quiet and orderly as business at a bank. F. P. B.

Grinnell, Iowa, March 27, 1889.

JURISDICTION WITHIN THREE MILES OF THE COAST.

To the Editor of The Nation:

Sir: On page 258 of the last number of the *Nation* you say: "Although we cannot give law to the subjects of other nations on water *more than a maritime league* from our shore"—and this in reference to the Alaska seal fishery. As your statements are entitled to respect, I venture to call your attention to a decision which, I think, puts an end to that pretension, viz., The Queen vs. Keyn, 2 Exchequer Division, 63 to 239. The question was, Had an English court jurisdiction of the crime of manslaughter committed by the master of a German ship in the British Channel within a league of the English shore? The decision was that it had not. The person killed was an English subject, and the killing was by negligent running over a sailboat and drowning a person on board; and the act was found to be manslaughter by the jury. So that the only question was, Had the court jurisdiction to try the man? Cockburn, C. J., on page 197, says: "*Ex concessis* the jurisdiction over foreigners on foreign ships never really existed; at all events, it has long been dead and buried—even the ghost of it has been laid." On page 196, speaking of the doctrine of sovereignty in the narrow seas: "Who at this day would venture to affirm that the sovereignty thus asserted in those times existed now? . . . What foreign government would not repel such a pretension?" It is interesting to notice that Judge Hopkinson is cited as deciding the same point, Baldwin 15, which was in 1829. Possibly this may be rested on the form of the legislation.

R. C. M.

Philadelphia, March 28, 1889.

A POSTAL ADMONITION.

To the Editor of The Nation:

Sir: I often receive from the United States closed envelopes, mostly containing printed circulars, stamped two cents, instead of five; and on every such envelope one has to pay a fine of threepence, or six cents. By allowing this fact to be made known, you will, I have no doubt, confer a favor on many persons in this country besides

Your obedient servant, X. Y. Z.

London, England, March 19, 1889.

Notes.

In our recent review of Mr. McCulloch's 'Men and Measures,' an article is cited on Grant and Rawlins by Gen. W. F. Smith. Gen. Smith and Gen. James H. Wilson had articles in successive numbers of the *Century*, and, by a slip of the pen, the article referred to was ascribed to Gen. Smith, though the author is Gen. Wilson. It will be found in the *Century* of October, 1885. The reader interested in Gen. Rawlins will do well to consult the appreciative article, likewise by Gen. Wilson, in Appletons' Encyclopædia; and it may be noted that the same competent author is now engaged on a biography of the too little known and appreciated Chief of Staff. He is also trying to collect whatever biographical material concerning Gen. Rawlins exists, which may be sent to him at his residence, Wilmington, Del.

Mr. Andrew D. Mellick, jr., Plainfield, N. J., is preparing a work to be sold to subscribers, called 'The Story of an Old Farm; or, Life in New Jersey in the Eighteenth Century'—a semi-social, semi-historical presentation. "Much will be told of early German emigration to the American colonies," the Hessian troops will be vindicated against aspersion, and justice done to the New Jersey Loyalists. The author has every qualification for making a work of this character agreeable and instructive reading.

'Two Chiefs of Dunboy' is the title of Froude's new historical novel to be published this month by Chas. Scribner's Sons. Scribner & Welford will publish immediately a second edition of S. Laing's 'Heimskringla,' revised, with notes, by Prof. Rasmus B. Anderson.

Houghton, Mifflin & Co. announce 'Prolegomena to *In Memoriam*,' by Thomas Davidson, with a full index.

T. Y. Crowell & Co. announce for immediate publication a new and cheap edition, in paper covers, of Tolstoi's 'My Religion.'

A new edition of Dr. Louis Starr's 'Hygiene of the Nursery' will be published directly by P. Blakiston, Son & Co., Philadelphia.

The first volume of Mr. Ernest Law's 'History of Hampton Court Palace' (London: Bell) was devoted to the Tudor Period; the second volume, recently published, covers the Stuart period, the last hundred years of the history of the palace being relegated to a third volume, which is yet to appear. It is a handsome small quarto, abundantly illustrated with views and portraits, most of them from old originals, and, as is natural, varying very much in style and merit. The work is executed with much industry, and contains much graphic detail of the life and events of the period, and deserves to be read in connection with the history of the period. We note especially the Hampton Court Conference of 1604 (p. 32), the confinement of Charles I. in 1647 (p. 130), and the residence of Cromwell (p. 174). Of Cromwell the incident is related (p. 187) that on the occasion of the marriage of his daughter Frances to Mr. Rich, "he amused himself with such vulgar horseplay as throwing about 'the sack posset amongst all the ladies to spoil their clothes, which they took as a favor, and daubed all the stools where they were to sit, with wet sweetmeats.'"

The unending production of introductions to Browning shows no sign of slackening, and if all were as excellent as the latest, 'An Introduction to the Poetry of Robert Browning,' by William John Alexander, Ph.D. (Boston: Ginn & Co.), it would be matter of congratulation. This analysis of the growth of Browning's genius has the great merit of brevity, definiteness, and completeness; the statement of the poet's opinions upon the soul, art, and the present frame of the modern mind towards spiritual matters, is clear and seems to us just; and the limitations which Browning's intellect

has placed upon his poetry are sharply, indelibly, and, we must add, courageously drawn. The author points out that it is Browning's intellect and not poetic instinct which has made him so fertile in his elder years, and that these later works have meaning for the mind rather than gratification for the poetic susceptibilities; and he shows, in the earlier part, the course of Browning's experiments with the drama, and his avoidance of its incompatibility with his psychological aims by means of the monologue, in which he has done his most perfect poetical work, in a way to leave nothing to be desired. The spirit of temperance and the exercise of judgment throughout may be recommended as exemplary to those who are still engaged in writing these "Introductions."

Browning would have saved a great deal of printer's ink and toilsome mental labor if he had followed the old practice of prefixing to every poem an "argument." The substance of most of these volumes upon him consists of well-meant attempts to supply this deficiency; and to read "arguments" without the verse is tediousness itself. This is one reason why James Fotheringham's 'Studies in the Poetry of Robert Browning' (Scribner & Welford, 1888), in four hundred generous pages, is unreadable. It contains nothing novel in the way of criticism; its grouping of the poems is not determined by a well-made-out principle, and it can only be useful in connection with a study of the poems by one's self. To those who enter on the subject for the first time it may be of value as a diffuse commentary, but it is to the catalogue of commentaries that it must be consigned, and with no high rank among them.

The Cavendish Library receives an interesting addition in a generous selection from the works of Leigh Hunt, both verse and prose, by Charles Kent (Frederick Warne & Co.). Leigh Hunt's place is between that of the essayists of his early years and the journalist of our own time. In literary taste and a certain felicity of phrase, as well as in his subject matter, he reminds us of the past age; but by his extraordinary rapidity and voluminousness of production, the day-to-day character of his writing, the momentary interest of most of it, he is one of ourselves. He was essentially a talker in print—one might say a gossip; there is a good of deal of books, something of not very discriminating travel, and much of the tea-table in his essays; they are all *petite*. The selection does not seem to us well made. The poetry given leaves Hunt far below his reputation, the prose is over-abundant. It is only justice to such a writer to give no more than his best. In verse that was little, in criticism it was considerable; and the happiness of his phrases, the poetic sympathy of his taste with the fanciful and sensuous part of the great poets, and his wide range of enjoyment—not in compass, but in extent—make it well worth saving. As for his essays of the cat-and-canary kind, they were not meant to freight the stream of time. It is no doubt a service to such a man to make selections from his works, and as in his case they have never been collected, it might seem a duty; but the delightfulness of Hunt was largely due to personal charm in the author and the thought of Keats and Shelley; and this is still so vital in the Autobiography and such a volume (to mention a minor work) as the 'Jar of Honey from Mount Hybla,' that the modern reader, with not too much time, had better turn to these to know the man.

Mr. Frank Carr's selections from the essays of Hazlitt in the Camelot series (London: Walter Scott; New York: Thomas Whittaker) make a model volume—just what such a revival of agreeable minor essayists should be. He gives us no more than twenty-four pieces, and chooses them so as to cover the different subjects on which the author customarily wrote—literature, the theatre, men, manners, and books. He has done well, too, to include those essays which are autobiographical, and record the conversation and habits of the wits with whom Hazlitt associated at Lamb's rooms, and which have the pleasantest flavor. The portrait of Coleridge is very effective, and those of Lamb, Godwin, Ayrton, and the rest, though done only by slight strokes, are full of vivacity. One may pass a very pleasant evening in reading the collection, and have at the end a strong impression of the excellence of Hazlitt's style, the sense of having caught the interesting conversation of a group of interesting men, and a kinder feeling for Hazlitt himself than the tradition of him evokes. Mr. Carr is to be congratulated on having presented his author so much to his advantage.

That repository of what is old and good made over into new appearance, "Bohn's Select Library" (Scribner & Welford), brings in olive-green covers Burke's 'The Sublime and Beautiful,' and C. W. F. Cooper's collection of 'Horace's Odes, Englished and Imitated by Various Hands.'

"The Stott Library," a charming little series for the pocket, in clear print, we meet with for the first time in the two-volume edition of the 'Essayes of Montaigne' (London: David Stott). The text is John Florio's translation, ed. 1613, and Mr. John Huntly McCarthy furnishes an introduction. There are two vignette portraits of Montaigne, after steel engravings. Altogether, one could not desire a daintier get-up.

Southey's 'Life of Wesley' is now reprinted, under the editorial care of the Rev. J. A. Atkinson, in the "Cavendish Library" (Frederick Warne & Co.). The text is pretty condensed, but the presswork is good, and the volume has a comely binding. Mr. Atkinson has judiciously rearranged Southey's notes and added sparingly of his own. The familiar likeness of Wesley is prefixed.

Mr. Reginald Wilberforce has both curtailed and added to the Life of his father, the late Bishop Wilberforce, published some sixteen years ago (A. D. F. Randolph & Co.). The present edition is both attractively printed and put on the market at a very reasonable price.

Routledge's "Universal Library," edited by Prof. Henry Morley, having been completed in sixty-three shilling volumes, is succeeded by the "Carisbrooke Library," having the same editor and publishers. The new series will include works too bulky for the earlier, but will never resort to small type for compression, being formed on a larger scale. The editorial introductions will be fuller, and there will be notes. The first volume consists of 'The Tale of a Tub, and Other Works by Jonathan Swift,' and Mr. Morley allows himself some thirty pages by way of biographical preface. The volume ends with the first seven letters from Swift's Journal to Stella.

To the foregoing reprints we can subjoin Bayard Taylor's 'Views Afoot' (New York: John B. Alden).

It is a moot question how best to teach reading in our schools, but custom has produced "readers" in series ranging from first even to sixth. Two illustrated series of four are now on our table, those bearing the name of Stickney (Boston: Ginn & Co.) and Harper's new volumes. There is no little difference between them, and yet they agree substantially, and share to our minds the defects of most similar books that have come under our observation. The editorial contribution is excessive, especially in the older readers; the selection is remarkable for avoidance of the best names in English literature; the poetical extracts are as a rule poor, and, taken together, not indicative of or contributory to a cultivated taste. We cannot say that books like these will have no value as auxiliaries, but by themselves they do not seem ideal instruments. Such leaflets as the Riverside Literature Series of Houghton, Mifflin & Co. make a much nearer approach to what we desire to see.

Natural history has also its serial readers, and here is the sixth in the line prepared by the late Rev. J. G. Wood (Boston School Supply Co.), and the third in the "Nature Readers" of D. C. Heath & Co., Boston, 'Sea-Side and Way-Side.' These have but a very limited rhetorical or literary function.

In 1853 the United States Government sent out an expedition to explore the La Plata under the command of Capt. Thomas J. Page, which, though very successful from a scientific point of view, involved this country in difficulties with Paraguay. His son, Capt. John Page, has been continuing his father's work by explorations of the rivers in the northern part of the Argentine Republic, known as the Gran Chaco, an account of which is given in the March Proceedings of the Royal Geographical Society. This vast plain, consisting of about 180,000 square miles, is divided into two provinces, the Chaco Austral and the Chaco Central. The former is apparently the richer of the two in natural resources, and is being rapidly developed. The northern province is still practically unknown, though the Government and private companies with Government concessions are making strenuous efforts to open it to settlers. Capt. Page gives a spirited account of his successful rescue of some frontier garrisons in danger of being carried away by a sudden flood, the rivers at such times eating away their banks, though lined with great trees, with incredible rapidity. This article is followed by an interesting description of explorations in the "Glacier Regions of the Selkirk Range," by the Rev. W. S. Green, illustrated by an excellent map. From observations made on the great Illecellewaet Glacier, he estimated that "the centre of the ice had moved along twenty feet in thirteen days." He referred to the terrible destruction of the forests in this region by fire, as did Capt. Wharton, Hydrographer to the Admiralty, in the discussion of the paper before the Society, who said that "any one who wanted to see the Canadian Pacific line in its glory should go there very shortly, because a great deal of its beauty would soon be spoiled."

The *Scottish Geographical Magazine* for March contains an account of the Islands of Melanesia, by R. H. Codrington, D.D., and a description, with elaborate tables and a map, of the earthquake shock in the Edinburgh district January 18, 1889. Mr. Ravenstein, the well-known African cartographer, compares Dr. Livingstone's account of Lake Bangweolo, on the shores of which he died, as given in his unpublished manuscripts, with those of more recent explorers, and constructs a new map of the lake, which is given, together with reproductions of Dr. Livingstone's original maps. He also gives a large number of astronomical and hypsometrical observations made between the years 1866-73 out of a great mass still lying buried in Livingstone's manuscripts.

The Haliburton Society of Windsor, N. S., founded in 1884 "to further in some degree the development of a distinctive literature in Canada," has just printed a paper on Judge Haliburton by Mr. F. B. Crofton of Halifax,

the first of a proposed series of annual publications. It is a very scholarly and appreciative sketch of the greatest of Nova Scotian writers, and one whose influence was very marked on certain characteristic departments of American literature. Though there are few readers of the 'Clockmaker' to-day, yet many of Sam Slick's shrewd sayings have become household words. Mr. Crofton takes this occasion to correct several blunders in the various biographical notices of Judge Haliburton, two of which, we regret to see, are faithfully copied by the editors of 'Appletons' Cyclopædia of American Biography.'

Mr. Christern sends us the current issue of Louis Figuier's *L'Année Scientifique* for 1888. This annual is too well known to call for comment, having attained its thirty-second year.

Nearly twenty years ago Mr. R. S. Newall erected at his residence, Ferndene, Gateshead, the largest refracting telescope then in existence. It is an excellent glass, of twenty-five inches diameter, and was made by the distinguished optician Cooke of York. Owing to very unfavorable atmospheric conditions at Gateshead, and to other serious reasons, this fine instrument has lain for the most part of this time idle, and its owner now addresses a letter to the Vice-Chancellor of the University of Cambridge, in which he contemplates the generous offer to the University of his telescope, the dome covering it, and other connected instruments. Mr. Newall expresses the hope that the glass may be specially employed in the study of stellar physics, and he wisely asks what proposals the University can make to insure its proper use and maintenance, in case his offer should be acceptable. A syndicate has therefore been appointed, on which Drs. Routh and Glaisher, and Profs. Adams, Liveing, Darwin, and Thomson are associated with the Vice-Chancellor, to consider Mr. Newall's munificent proposal, and report to the Senate the arrangements and expenditure necessary to utilize and maintain the telescope for astronomical and physical research. This instrument stands about sixth in the order of size at present, and is by far the largest telescope now in Great Britain.

The Astronomical Society of the Pacific was organized at a meeting held February 7, and a circular, forming No. 1 of its publications, has just been issued. The officers of the Society are mostly connected with the Lick Observatory, and the present membership is forty, about two-thirds of whom reside in San Francisco. They hope to count in their membership every person on the Pacific Coast who takes a genuine interest in astronomy, whether he has made special studies in this direction or not. The Society is already canvassing all the other societies and technical organizations of the Coast, the colleges and schools of California, and the Government surveys of the State for new members, and it is expected that a vivid interest in the science can be created and fostered, and that the Society will have real weight in the advancement and diffusion of astronomical knowledge. In prospect are the establishment of a high-class astronomical journal, the foundation of a special astronomical library, and the organization of such scientific work as may be advanced by mutual assistance. Three or four hours of Saturday evenings in summer the telescopes of the Lick Observatory are to be put at the disposition of those who attend the Society's meetings on Mount Hamilton, for the purpose of affording actual demonstrations from the heavens of the subjects under discussion. The winter meetings of the Society will be held at San Francisco, where will be its library, collections, etc. It is intended as a popular organization in the best sense of the word, and it is entirely an outgrowth of the coöperation of amateur and professional astronomers in the successful observation of the total eclipse in California last New Year's Day. The circular contains the by-laws of the Society.

"A. I." writes us from New Bedford: "With *topsoltiria* in 'F. H.'s' article on *Topsyturvy* (*Nation*, March 28) may be compared the Scotch *tapsalteerie*, a word on which the Scottish dictionaries throw a good deal of darkness. See Burns, 'Green Grow the Rushes'—

"'An' warly cares, an' warly men,
May a' gae *tapsalteerie*, O!'"

—The most important contribution in the April *Scribner's* is Charles Francis Adams's paper upon the relations that should exist between railroad corporations and their employees. He sets aside the doctrine that these corporations should enjoy the same right of dismissal that individuals possess, on the ground that they perform public functions; and since in practice the exercise of this absolute right interferes with their efficiency as common carriers, it is to be limited in such a way that the public convenience shall not suffer. He argues that a working theory must represent the facts, and ascribes the present friction and confusion to the false belief of the laborer that his association affords real protection, and the false assumption of the manager that his right of dismissal is arbitrary; the actual state of the case being that the association is often beaten, and that the manager does not dare exercise the right he claims. Mr. Adams is ready with a solution, and seeks it through the machinery of representation which has served us usefully in other matters. He would have the permanent force enjoy tenure during good behavior and be protected in this tenure by a tribunal, in the choice of which it should be represented; and the board of representatives should, besides, operate in all matters wherein the interests common to the company and its men are concerned, such as hospital, pension and insurance funds. He enters upon the plan of organization in detail, and points out many benefits likely to ensue to the morale and happiness of the force, in addition to the prevention of strikes, which is rather a benefit to the community. The frank way in which real conditions are recognized in this paper is perhaps its most notable feature, at the present stage of the agitation, but the lines of practical remedy laid down will excite valuable discussion. It is Mr. Adams's forte to agitate minds, rather than the masses; and this paper is likely to disclose wide differences of opinion. The geographical article on Mt. St. Elias, and the physiological one upon contortionists, are also to be mentioned, as novelties.

—The April *Century* is professedly a centennial number, and it makes prominent the fact that in the close of our long celebration of the gradual forming of the nation, from the fight at Concord to the successful inauguration of the Constitution, the popular mind is bent less upon the historical moment of our birth as a nation than on the character of "the father of his country." This is Washington's day, and we seem likely to see a renewed expression of that still inherited popular sentiment which attended him during his journey to New York, and surrounded him at the moment when he took the oath with a veneration which is unique in history. These new articles narrate in detail the incidents of the months of March and April pertaining to the inauguration, and are intended to bring forward especially the social aspects of the occasion, and the individuality of the men and women who took part in it. They contain also a graphic account of Washington's habits in private life at Mount Vernon, his family interests and his attachments of friendship, with many interesting cuts. Particularly noticeable here, and what continues to strike the student of the memoirs of the time with increasing force in proportion to his intimate acquaintance with them, is the impression of greatness which Washington never failed to make upon men who saw him. Fisher Ames's account of his feelings in gazing upon the ceremony is an admirable example of this; and he was but one of a cloud of witnesses which might be called to the power of Washington's character in his own person. It was not what we call "magnetism," of which, perhaps, Napoleon is the most complete modern example. It had in it a reverence which subdued affection and gave mere idolatry a secondary place; and much as Washington's greatness is still esteemed, it is likely that the real sense of it is less now than in his own age. His character had none of that brilliancy which fills the smallest-brained hero-worshipper at once. Like a mountain, it needs to be lived with before it is seen in its true magnitude, and no study can take the place of that score of stormy public years during which his contemporaries lived with him. It is fitting that at the last of our patriotic fêtes in memory of the founders, the country should be called upon to look upon that solitary figure which commands the time, and to reflect upon that personal character great and sound enough to be the first bond of the national union.

—The *Atlantic* yields a new example of Dr. Holmes's unflagging verse on the favorable subject of his contemporaries—in this case a eulogy of Lowell, on the occasion of his seventieth birthday, in which the height of admiration is generously and fittingly expressed. There is much other verse in the number, but the prevailing feature is biographical. F. C. Lowell writes at length on Thomas Basin, a French bishop of the fifteenth century, and records the confusions of the times with an effect of confusion on the mind. Miss Guiney contributes "An Outline Portrait," which, however, is so overlaid with details of all sorts of people that it might better be described as done in small hatchings than in outlines. The subject is Lady Danvers, the mother of Herbert and the friend of Donne, but the latter is the figure that stands out most distinctly on the page. Miss Preston continues her charming rendering of Cicero's old age, devoting this number to the last year of his life. No one has better succeeded in giving the air of modern and contemporary time to the most famous representative of the culture of old Rome, without which element there is a fatal lack of truth in portraits of Cicero. Mr. Merwin's examination of the place of the people in government is an interesting piece of social philosophy, though not strikingly original, and altogether too brief; the more useful part of it is the application of Rousseau's principle of pity, and the happy citation from Darwin in respect to the identity of the moral and the social instinct. Mr. Merwin winds up with the somewhat unnecessary and stale maxim that "all forms of government are bad, but the worst is better than anarchy." This is to stamp his work as amateurish.

—Mr. Gosse's article in the April *Forum* upon "What is a Great Poet?" is of the nature of further remarks in explanation and defence of his much-debated essay upon the query whether America has produced one. It would have been simpler to define his term at the beginning, but he succeeds so little now that

there was no real loss. He says, in rather an off-hand way, that "the main elements of poetical greatness will be found to be originality in the treatment of themes, perennial charm, exquisite finish in execution, and distinction of individual manner." The first and last of these elements need to be more sharply separated, and the second and third involve much the same thing. But this definition can be left one side, as the writer makes little use of it. He is more interesting when he confines himself to remarks the value of which depends on æsthetic rather than logical perception. He consents to abandon Gray, principally because he did so little, and he continues to reject Marlowe, Scott, and others; but the weight of his reply is directed upon some American critics who have informed him that Dryden (and Pope by implication) are "not read in America." He defends them with warmth, and draws attention in a warning paragraph to a disposition in America to rebel against literary masters, and to substitute a plébiscite of popular taste for the judicial sentence of those learned in the canon of literature. Perhaps, on a nearer view, the signs of the times which he reads "large," would be seen to be writ exceeding small. Because one chair happens to be filled with an incompetent and loud professor, the whole university is not gone to the dogs; and as to Dryden's not being read in "Crawfordsville, Indiana," he need only to remember that "America" is a rather large piece of ground. The plébiscite has as yet found but one voice, and there is no sign that Apollo's writ has failed to run in consequence. Indeed, we doubt whether there was ever a time when Mr. Gosse's thirteen immortals (for we will not drop Gray) had more numerous readers in the republic than to-day. But his whole discussion of the subject has from the first proceeded upon mistaken lines.

—Attempts have been made at various times by different newspapers to get at the consensus of public opinion as to favorite authors, by taking a vote among their subscribers. These efforts have never been very successful, because each newspaper has its own set of readers and does not easily get beyond them. Another way of testing popular opinion is by comparing books written about authors, since these books are naturally made to sell, and so have reference to a supposed public opinion, wise or unwise. Some interesting results may perhaps be found by comparing the last three books published, of this kind, in the United States, namely, Mr. W. H. Rideing's 'Boyhood of Living Authors' (1888), Mrs. Sarah K. Bolton's 'Famous American Authors' (1888), and 'Authors at Home,' edited by J. L. and J. B. Gilder (1889). It is important to notice that, of these, Mr. Rideing is an Englishman residing in Boston; Mrs. Bolton resides at Cleveland, Ohio, and Mr. and Miss Gilder live in New York. We thus have represented the New York, Boston, and Ohio points of view. In one case, we have a man's selection, in another case a woman's, and in the third case a man's and a woman's conjointly. 'Authors at Home' comprises twenty-six living American authors, Mr. Rideing's book fifteen, and Mrs. Bolton's twelve. We thus have sufficient material for a tolerably fair comparison. All the editors have evidently tried, if only for business purposes, to give a properly varied selection; and when we put them all together, the basis of inference will be still larger. The authors selected in the largest and latest of these books are as follows: Aldrich, Bancroft, Boker, Burroughs, Cable, Clemens, Curtis, Eggleston, Hale, Harris, Harrison, Hay, Higginson, Holmes, Mrs. Howe, Howells, Leland, Lowell, Mitchell, Parkman, Stedman, Stoddard, Mrs. Stowe, Warner, Whitman, Whittier. Mr. Rideing includes ten out of these twenty-six, and adds Boyesen, Fawcett, Knox, Stockton, and Trowbridge. Mrs. Bolton also includes ten —not always the same with Rideing's—and adds Carleton and Gilder, but puts in none of Mr. Rideing's supplementary list. It is in placing the three books side by side and tabulating the results that the chief interest of the inquiry consists.

—It appears by comparing the lists that seven authors are found on all three of them: Aldrich, Higginson, Holmes, Howells, Lowell, Stedman, Warner. All these except Howells were born in New England, and all but Howells and Stedman still reside there. Six appear on two lists: Cable, Clemens, Eggleston, Hale, Stoddard, Whittier. Just half of these were born in New England, and all but two (Eggleston and Stoddard) now live there. Twenty appear on one list only: Bancroft, Boker, Boyesen, Burroughs, Carleton, Curtis, Fawcett, Gilder, Harris, Harrison, Hay, Mrs. Howe, Knox, Leland, Mitchell, Parkman, Stockton, Mrs. Stowe, Trowbridge, and Whitman. Of these twenty, six were born in New England and five now have that as their habitation. Of the whole thirty-three, fifteen, or a little less than half, are natives of New England, and fourteen now reside there. It is a rather remarkable fact that a section of the country now relatively so small should hold its own so well in literature. And the wider region, described by Mrs. Mary H. Ford at the recent Western Authors' Convention as "the effete East," seems still to have the field pretty fully to itself. It must, however, be frankly admitted, in conclusion, that this numerical result is very far from exhibiting any accurate or trustworthy consensus of opinion. Some prominent authors, not now residing in America, as Harte and James, are altogether omitted from these lists. In some cases, accidental circumstances have excluded certain authors, as when Mrs. Bolton omits Whittier and Mrs. Stowe because she has written of them elsewhere. There are also some inevitable elements of inaccuracy, such as the greater immediate popularity of belles-lettres literature as compared with history; it by no means follows that Warner, for instance, has secured a more permanent place in literature than Bancroft or Parkman because he is on three lists and each of the others on one only. All that can be said of estimates based on this kind of selection is, that perhaps it is a shade more significant than a post-office ballot, or the vote for Presidential preferences on a railway train.

—Dr. H. Bening, in the Journal of the Historical Society of Lower Saxony, questions the claim of the Angles to the honor of giving their name to England. The claim rests mainly on the testimony of the Venerable Bede, who wrote nearly 300 years after the Saxon invasion; while neither Gildas nor any other contemporary writer mentions the Angles at all. It seems unlikely that the Angles would take part in such an enterprise as the invasion of Britain. They lived in the eastern part of Schleswig, on the Baltic; if they used their own ships, they would have to sail quite round Denmark; if not, they would have to go across country to the North Sea and find ships there. Moreover, it is improbable that the Angles would join the Saxons in such an enterprise. They were, in the fifth century, and till quite recent times, a purely Jutish, or Danish, people; not till the beginning of the present century was the Danish language supplanted by the German. There was, however, a people inhabiting a large district on both banks of the lower Weser, a branch of the Saxon race—the *Engern*, or Enger-Saxons. It seems highly probable that it was this tribe that joined the Saxons in their invasion of Britain, settled on the eastern coast, and, at the formation of the Heptarchy, gave their name to the new kingdom. *Eng-land* is even more obviously derived from *Enger-land* than from *Angle-land*.

—Apropos of our review of Count von Eckstädt's 'Shakespeare und Shakspere,' found in another column, it seems proper to call attention to the great literary discovery just communicated to the world through the columns of the Berlin *Gegenwart* by Prof. Moritz Carriere, the Munich "Aesthetiker." This discovery, whose title to the supreme rank in the literature of mare's nests will hardly be called in question, is simply that Goethe's "Faust" was stolen from Lessing. After reading the first of Prof. Carriere's two articles, we were inclined, though fully aware that the Teutonic professorial intellect seldom sports, to think the whole a clever bit of persiflage. As persiflage, at any rate, it would have been decidedly clever; one might go far to find a neater *reductio ad absurdum* of the method of the Baconians, which is, be it observed, a different thing from the Baconian method. But upon reading the second article, which is mainly occupied with Count von Eckstädt's "researches," and concludes with a formal application for membership in the "tolerant church" of the Baconians, we find reason to fear that Prof. Carriere is in dead earnest. His argument is like this: Lessing writes a "Faust" and loses the manuscript. He visits Leipzig while Goethe is studying there, but the latter, instead of cultivating the famous man, as we should expect, takes pains to avoid him. Then presently we begin to hear of a "Faust" by Goethe. He reads scenes to his friends, and excites great expectations, but refrains from publishing anything until after Lessing's death. Lessing goes through life with a poor opinion of Goethe's poetical powers. Musing long on this train of suspicious circumstances, Prof. Carriere one day suddenly saw a great light: Goethe had cabbaged Lessing's "Faust," and, translating its prose into Hans Sachs doggerel, had passed it off for his own. The clue once found, mysteries began to clear up and corroborative evidence to appear at every turn. "Faust" is full of Lessing's ideas. The prose scenes are Lessing untranslated. And so forth. As a humorist Prof. Carriere would deserve fuller exposition and high praise; but viewing him as a serious writer, we can only recommend hellebore taken in as large doses as the family physician will countenance.

THE NEW ENGLISH DICTIONARY.—I.

A New English Dictionary on Historical Principles. Founded mainly on the materials collected by the Philological Society. Edited by James A. H. Murray, with the assistance of many scholars and men of science. Part iv, sec. 1. Bra—Byz, completing vol. i (A and B). Part iv, sec. 2. C—Cass, commencing vol. ii. Oxford: Clarendon Press; New York: Macmillan & Co. 1888.

THE fourth part of the new dictionary of the Philological Society, our notice of which has been too long delayed, finishes the first volume and begins the second. It is, accordingly, divided into two sections. The first includes the words from *Bra* to the end of the letter B. The second extends in the letter C to the word *Cass-*

weed. With the first section are issued the preface and the introduction to the one completed volume, which contains the words beginning with the first two letters of the alphabet. The undertaking has certainly a long way to travel before it can come even in sight of the end; but it is a good deal to have it started so successfully on the road to fulfilment.

The progress of the work necessarily furnishes ampler opportunities to test its value. Familiarity with it, so far from breeding contempt, impresses one more and more with its general excellence and with its absolute indispensableness to every student of the language. As it advances, there is naturally exhibited greater skill in handling the immense stock of material that has been collected. Two qualities have marked it from the outset in which it finds nowhere a superior in similar undertakings in any tongue. One of these is the skill with which the aid of typography has been called in to facilitate reference by the arrangement of paragraphs and the employment of different sizes and styles of type. This has doubtless added largely to the expense; but it is no easy matter to reckon the saving of time and labor effected by it, to say nothing of the benefit to the morals by its giving no occasion to the display of that wrath which the consultation of most dictionaries has a tendency to provoke.

This is, however, a view of it from the purely material side. There is another in which it stands just as high. Something more than a mere accumulation of facts, no matter on how grand a scale, is essential to the carrying out of a task of this kind. Upon no one more forcibly than upon him whom necessity compels frequently to consult dictionaries, does the truth of the poet's assertion impress itself that while knowledge comes, it is wisdom that lingers. The vagaries, the fancies, the guesses into which lexicographers have run in the effort to explain what they did not understand, or to impart to others knowledge they did not possess themselves, have not always tended to inspire confidence in the men who are striving to carry the burden of an omniscience to which they were not equal. Especially has this been true in the department of etymology. It is the distinction of those concerned in the present undertaking that they have not sought to embarrass future investigation by present conjecture. This means more than at first appears. Lexicographers, even if timid themselves, have to a remarkable extent the courage of other men's convictions. They are perfectly willing to give currency to a definition or a derivation which they could never have been induced to originate upon their own responsibility. It is not so in this instance. Nothing is asserted upon mere authority. The editors, even when stating the suggestions of others, refrain from giving them their own sanction.

In only one instance, so far as we have observed, have they laid themselves open to criticism upon this score; and the variation from their usual practice is noteworthy enough to merit special comment. It occurs in the case of the somewhat peculiar expression *brown study*. The adjective here has assuredly the general idea of 'deep,' 'profound,' 'abstracted.' It is hard to fix upon the phrase the sense of 'gloomy meditation' by which Johnson defined it; and the particular meaning given to it in this dictionary of 'an idle and purposeless reverie' is certainly not common. But it is in the explanation of its origin that conjecture appears here for once to have triumphed over judgment. The meaning is declared to have apparently come in the first place from *brown* in the sense of 'gloomy,' but that this sense of the adjective has to a great extent been forgotten. When, however, we turn to the adjective itself, we find that so far from such a sense having been forgotten, there is not the slightest record that it ever existed. The signification of 'gloomy,' 'serious,' is, indeed, imputed to it, but imputed to it solely for the sake of accounting for the origin of *brown study*, to which a cross-reference is made. No actual example of such a usage is furnished. It is hardly necessary to remark that this is not a method of derivation that advances knowledge, and the origin of the meaning of *brown study* remains as much in the dark as ever. It may be added that *stiff* seems formerly to have been an equivalent expression. In the romance of William of Palerne one of the characters is represented as having fallen "into a styf studie" (1, 2981), and the same usage with slight variations can be found in lines 4038 and 4056 of the same poem.

This is, as we have stated, an illustration of a too common practice on the part of lexicographers; but in spite of our illustration the editors of this dictionary are remarkable not for falling into it, but for not falling into it. A notice of a work of this kind has, indeed, from its very nature a tendency to give to flaws and omissions a disproportionate importance, and therefore to convey to the reader an essentially wrong impression. The reviewer can only speak of the merits of the performance in general terms; it is only when he comes to point out defects that he is under the necessity of descending to details. It would be impertinent as well as unimportant for him to recount how many mistakes of his own had been corrected, how much new light had been thrown upon matters that had been previously obscure, how many complete gaps in his knowledge had been filled up. It seems, therefore, an ungracious act to dwell upon specific errors; for unfortunately particular fault-finding always makes a much greater impression than general commendation. Still, it is only in this way that there can be any hope of finally securing that accuracy and completeness of knowledge which should be the ultimate aim of all those interested in English lexicography.

The present work is certainly not perfect. This is by no means a very serious objection. If, indeed, men waited for perfection before undertaking a task of this kind, nothing would ever be accomplished at all. But in general its faults are rather of a negative than of a positive character. The important thing to be noticed is, that while there are deficiencies in the work, as was perhaps inevitable, there are very rarely errors. To illustrate precisely what we mean, we give one specimen of the very few faults of the latter kind that can be found in the first volume. It occurs under the word *arrest*. From the Summoner's tale of Chaucer there is quoted, with a definition peculiar to itself, the following couplet, which, for the sake of convenience, we put in modern orthography:

> "An irous man is like a frantic beast,
> In which there is of wisdom none arrest."

The meaning of the sentence is clear. An exceedingly angry man, the poet tells us, has the nature of a frantic beast over which no restraint, no check, is exercised by wisdom. *Arrest* has consequently its not unusual sense of 'stoppage, stay, check.' But in this dictionary there is manufactured for the word in this particular couplet a signification of 'remaining, abiding, continuance,' which is utterly unsuited to the context, and for which the passage is the sole authority given.

From errors of this sort the work is, however, almost entirely free. It is naturally in the line of omissions that a far larger list of imperfections can be produced. Upon one point in particular we have insisted previously, and the fact that it seems to us a matter of the very first importance must be our excuse for recurring to it again. This is to the effect that the dictionary fulfils but imperfectly its duty as a record, not of usage, but of the best usage. It ought to be a work to which we can turn with absolute confidence, whenever the question of taste or propriety comes up, that everything, or at least enough, has been recorded to settle the question in dispute decisively. When Horace said that usage was the standard of speech, he did not mean the usage of this man or that man indifferently, but the usage of the best. We should think little of a Latin lexicographer who should furnish as authority for some special meaning or construction the words of one of the authors of the Augustan History, and should leave unrecorded those of Cicero illustrating the same usage. We fail to see why this same standard should not be set up for an English dictionary; or, to put the idea in a similar concrete form, the value of the work to men of letters would be vastly enhanced if it gave us more of Newman, Ruskin, Tennyson, and Browning, and less of Gen. Peronnet Thompson, a writer who is here quoted with a frequency out of all proportion to his importance.

We are far from meaning to assert that the great authors are not often cited, or that they are not cited where their authority is of the greatest weight. Our contention is, that too frequently they are not cited where it is of special importance that they should be—that is to say, in the cases where the usage is at all striking or peculiar, or where the word or expression is uncommon. The definitions are given, but sometimes not the best illustrations, and that, too, in instances where the material must have been in the hands of the editors. Take, for example, the use of *buskined* as applied to tragedy. Milton's 'buskined stage' in the "Il Penseroso" is of vastly more importance as authority than the three quotations given, though even they are taken from Massinger, Young, and Hazlitt. His use of "canon laws" in "Comus," unrecorded here, outweighs any extract furnished to illustrate the attributive sense of this or similar expressions. Dryden, in the "Annus Mirabilis," speaks of *building* ships. We are given here as an example of such usage a quotation from the records of the proceedings of Parliament a few years before. When we leave the class of words about the meaning of which there is little or no dispute, and come to significations of a more peculiar character or of more doubtful propriety, the omission to cite from the highest attainable authorities is a matter of more serious moment. Surrey, for illustration, speaks of "the *brittle* port," where the anchor fails to hold. Keats, in his "Endymion," uses *brush* of the tail of a lion instead of a fox. In one of his poetical epistles he mentions a "*canvas'd* ship." More marked, however, than any of these is the omission to record Tennyson's use of *byre* in his poem of "The Victim," in which he says that "thorpe and byre arose in fire." The failure to insert it is the more noticeable because in this piece the word seems to be used—it is impossible to say that it is used—in a sense which in this dictionary is expressly condemned.

So much for deficiencies of this character. They are of the only kind for which we are disposed to hold the editors at all responsible. It is hardly they with whom fault can be found for the failure to record words or meanings that have been omitted, or instances of earlier

or of later usage. The examples have not been given because they have not been received. That there are such failures is only what might have been expected. One of them occurs in the expression *by and by*. It is used by Chaucer in the sense of nearness in space as well as of nearness in time. In the Knight's tale we are told of two wounded knights lying on the battle-field "by and by." The glossaries, curiously enough, define this as 'separately,' which can hardly be said to furnish any sense at all. The context requires it to be used with the signification of 'close together, side by side.' The proverbial phrase *sift to the bran* is given; but not the equivalent and apparently earlier one, *bolt to the bran*, which is found in the Nun's Priest's tale, though the passage containing it is quoted under *bolt* to illustrate that particular word. The unnoted variant form *brother-by-law* occurs for *brother-in-law* in the dedication of Gascoigne's 'Complaint of Philomene' (1577). Again, in Ben Jonson's play of "The Epicene," *broken-up* is employed to signify 'corrupted, vitiated,' and in fact is so explained. *Caperer* is the contemptuous term applied to a dancing-master by Shadwell in his comedy of "The Volunteers." This same writer is authority for *caravan* in the slang sense of a 'dupe,' which is given in this dictionary; but his further use of it in the signification of 'a kept mistress' is not recorded. Yet with this meaning it appears twice certainly in his play of "The Woman Captain." Again, *capriccioso* appears here only as an adjective denoting a direction in music. Yet it is used as a noun by Smollett in his 'Ferdinand Count Fathom' (chap. 31), where it denotes a musical performance.

Of some of the words or meanings here given earlier usage can be recorded. *Bum-rolls*, quoted from Killigrew, 1665, can be found in Ben Jonson's "Poetaster." *Brisk* as applied to wine, with a quotation from Shakspere, is used by Green of claret in his play of "James IV." The earliest quotation for *Cantaloup* is of the date of 1839. It is a little surprising to see it spoken of as employed chiefly in the United States, for the cultivation of the variety was long ago introduced into England. Lord Chesterfield at London, writing under the date of December 23, 1748, asks Dayrolles at the Hague for some seed of the Cantaloup melon. "The Cantelupes," he adds, "are in my opinion the best sort of melons; at least, they always succeed best here." In subsequent letters he makes further references to them.

We are far, however, from attaching special importance to these omissions, the number of which could without difficulty be enlarged. It is inevitable that every additional year will add to the stock of knowledge of the words here recorded. Early or later illustrations of use will be found, and to a slight extent new significations. New words will be revealed which have escaped notice. It is sufficient praise of this dictionary that it has brought together and made accessible an immense body of facts, systematically arranged and edited throughout with care, with learning, and with judgment. Upon this solid base future generations can confidently build with fuller knowledge the perfected work, and this is the first time that such a possibility has existed in the case of our tongue. Much may be added; but there is very little that will need to be revised.

Letters, Poems, and Selected Prose Writings of David Gray. Edited, with a biographical memoir, by J. N. Larned. Buffalo: The *Courier* Co. 1888. 2 vols.

THESE memorial volumes present the history and something of the work of one of those men who from one cause or another are felt to have left no adequate result of their lives, of whom we commonly say that the man was more than the work. The charm of personal character, the sense of unexpressed power, lead their friends to gather together such fragments and records as may indicate the one they knew, and especially recall and define his memory to themselves. This life of David Gray is conceived and executed in this spirit. He was known as a public man in his locality, being the editor of the Buffalo *Courier*, a paper which was conducted by him in accordance with high principles of journalism; and he was thus brought into relations with fellow-editors and some literary men, while holding an enviable position in the respect of his own community. But he was a journalist against his will. Born in Scotland, in 1836, he emigrated in his boyhood with his father's family, and settled on the Wisconsin prairie, when that was on the line of the ever-moving frontier; there he grew up on a farm, with scanty schooling: and, by native bent, notwithstanding the unfavorable conditions of life, developed a strong taste for poetry. The passages which describe his country boyhood and the growth of warm friendship with the son of a neighbor, who also had been touched, but not filled, with the poetic faculty—their evenings and nights together, of which the description and the records are still fresh with young and untried enthusiasm—are almost pathetic. They would come together, after the labor of the day, which made them feel an inch shorter at night, as Gray says, and share their new treasures, rare in a country of few books, Byron and Moore, Poe, Coleridge, and the other poets of the ruling taste, with real literary passion; and, of course, they wrote verses and confided them to each other, and thought of fame. This is the opening of Gray's life, a portion of it which always lay behind him like a dream, and was evidently affectionately cherished in his memory.

Real life began for him when he went to Buffalo, at the age of twenty, as Secretary of the Library of the Young Men's Christian Union. From this employment he drifted into business, and shortly after became connected with the paper he was to serve as a reporter of the produce market. He did not feel his early hopes slipping away from him, and the grasp of circumstances begin to throttle the inner life, without regret; but he accepted his lot, and became city editor and afterwards editor-in-chief. He was drawn into journalism, and the profession absorbed his energy. The life which is narrated here, however, is not a business career, but his companionship with friends, with whom his exceptional nature made him a favorite. He sometimes wrote verses, many of them upon public occasions; and during a three years' absence in Europe he sent letters to the paper which make up the second of these volumes. These descriptions of travel, mainly, of course, from Italian soil, but also from England, Germany, Sweden, Russia, Switzerland, and the East, exhibit a mind with great capacity for the enjoyment of nature, with sensibility to the more popular (we do not use the word in a depreciating sense) works of art, and with a strong response to historical association. They afford the surface view, full of color and enthusiasm, which the rapid traveller obtains in foreign lands, but without finish of style or that picturesque or humorous detail which the present taste enforces; but, so far as they illustrate Gray's nature, they give an impression of one excellent in himself and desiring excellence. The remainder of his literary work consists of a few poems, of which one can say only that they show the spark of poetic feeling. A few of them are much better than the rest, and in those which still glow with the contemporary passion of the war, one feels the pulse of the nation; but the work of unripe years has too large a share in the collection, and even in maturer compositions the verse is too obviously the echo of those poets whom Gray loved. What one sees in them is rather the mind passive to poetic influences, whether from books or in nature and daily life, than the mind active with its own secret and underived energies. The poems, like the letters, bespeak rather than express the man; and this is the impression which he seems to have made upon his circle of acquaintances.

He died in 1888, after a few years of sadly interrupted health, in painful circumstances, being in a railway accident while on his way to attempt to recover strength, although then his invalidism gave little promise of any permanent improvement. The event drew forth many public tributes of respect for a useful and honorable career as a man of his day in the affairs of his own people; and, though he failed to realize his hopes, and seems to have felt a sense of waste in his life, this biography testifies amply to high character and to duty faithfully done in a measure which leaves no occasion for regret.

Wordsworthiana: a Selection from Papers read to the Wordsworth Society. Edited by William Knight. Macmillan & Co. 1889.

IT is observed in this volume that Wordsworth has been "fortunate in his eulogists"; but this is but half the truth. He has been fortunate in the whole class of minds he has attracted; and the names of those who have taken part in the proceedings of the Wordsworth Society, and whose contributions are here reprinted, are a striking illustration of this fact. From these gentlemen one would expect criticism either fine or solid, but it is a proof how completely the criticism of Wordsworth is exhausted to find that these papers are no more than gleanings after the harvest. The cardinal points, of course, are necessarily here. They are Wordsworth's philosophy, his morality, and his regard for nature. The first topic is, as usual, unfruitful; the discussion of his "Platonism" by Mr. Shorthouse, and his "Theism" by Mr. Veitch, reflects the vagueness of Wordsworth's speculative dogma, which seems to have consisted really of pantheistic conceptions imperfectly appropriated by his mind, and confused by him with his own exalted feelings under the stimulus of scenery. Nothing has ever been made out of it for the satisfaction of the intellect; and perhaps the best commentary on it is Lord Selborne's declaration that, profound Christian as he is, he has never felt anything in Wordsworth's moods inharmonious with ordinary Christian belief. The Dean of Salisbury speaks of Wordsworth's morality, as does also Aubrey de Vere, but both briefly; and, as to his regard for nature, the Hon. Roden Noel makes an elaborate and somewhat mystical plea for the "pathetic fallacy," quite in Wordsworth's spirit. Hutton, whose discernment and precise taste always give attraction to his remarks, and Lowell, whose address has been widely circulated, are the real critics of the company, and both evidently felt the exhaustion of the ground.

The more interesting papers are rather about the poet than upon his works, or else deal with special aspects of the general subject, in essays that resemble extended notes. Mr. Rawnsley's collection of the remarks of the peasants who

still remember the poet is entertaining rather than valuable, but shows us clearly the way in which he was regarded by the country-side into whose judgment poetry did not enter. Mr. Ainger's remarks on the poets who helped to form Wordsworth's style are interesting, and so are the papers on the Chaucer modernizations, by Dowden, Wordsworth's treatment of sound, by W. A. Heard, and his relation to Science, by Spence Watson. The last shows that the poet was by no means unsympathetic with science, but, on the contrary, strongly impressed by its work. Mr. Knight's list of portraits is also a valuable contribution.

The most striking portion of the collection, however, consists of the speeches of the Presidents of the Society, Arnold, Lowell, Lord Houghton, and Lord Selborne, with the reply to Arnold by Lord Coleridge and that to Lord Selborne by Aubrey de Vere. These are all admirable examples of just what such exercises should be, uniting ease and intellectual refinement with a delightful personal touch. They belong to a kind of speech-making to succeed in which is a proof of social as much as of literary cultivation. The intellectual element was more pronounced in Lowell's speech, friendliness in the rest. Lord Houghton's account of the poetic revival at Cambridge, and the expedition of the undergraduates to enlighten Oxford, is a reminiscence in itself delightful with the charm of youth, and related with the pardonable complacency of age; and Lord Selborne's simple and straightforward confession of what he personally owed to Wordsworth in his own life could not be bettered. It is from such acknowledgments as this that one learns best to appreciate the reality of Wordsworth's influence, and of poetic influence in general, to ripen the principles inculcated upon English youth and make of them a spontaneous rule of duty, and also to expand and refine the mind. The distinguished intellectual rank of many of those who have been mentioned, their marked literary taste, and the evident sincerity of their regard for Wordsworth as a helping influence, and not merely a source of æsthetic pleasure in their lives, show the deep mark he has made on the generation he taught, and usefully remind those of us who will not allow his moral weight to obscure in our minds his poetic limitations, how much an inborn race-sympathy and union in moral and national feeling may generate power out of genius even in the face of great deficiencies.

Shakespeare und Shakspere. Zur Genesis der Shakespeare-Dramen. Von K. F. Graf Vitzthum von Eckstädt. Stuttgart: Cotta; New York: B. Westermann & Co. 1888.

A BOOK-TITLE like this naturally suggests to the mind some sort of contribution to a familiar orthographical discussion. This is what we had anticipated upon seeing the title in the German trade-lists. But the volume before us turns out to be nothing of that kind. It is not concerned with telling us how to spell the name of a famous English poet, but with proving that there never was a poet of that name at all. Count von Eckstädt, sometime Minister of the kingdom of Saxony to Great Britain, has undertaken to get together all of the "facts upon which is grounded the conviction of those who regard Francis Bacon as the author of the poems and plays that appeared under the names of Christopher Marlowe and William Shakespeare." The Count's theory is, that the boorish play-actor who held horses in London, was descended from a Warwickshire peasant of French extraction, whose name was Jacque's Pierre—that is, as we are kindly informed, Jacob's son Peter. This name was then "softened" by the Warwickshire people into Shakspere, pronounced Shaxpur. On the other hand, Shakespeare was a high-sounding nom-de-guerre, under which Lord Bacon chose to publish the plays written by him, or at least that portion of them which he did not prefer to print under the other *alias* of Christopher Marlowe. To emphasize this distinction between Shakespeare and Shakspere our author uniformly prints the latter name in heavy German characters, the former in ordinary Roman. The Count gives us to understand that, before reaching his present enlightened convictions, he gnawed long and hard at the file which always tries the teeth of the Baconians—namely, the question, How could an "ignorant play-actor in a barbarous age" ever have written these astonishing plays, which even we, the heirs of all the ages, striking the stars as we do with our sublime heads, sometimes have difficulty in following! To such an old-wives' tale he can only say, *Credat Judæus Apella.*

For our part, we cannot declare upon honor that we have found the Count's pages exciting at every point, but they certainly do provide for a receptive spirit many an innocent gratification. For example, to a lover of his country it is no small titillation to find Mr. Donnelly figuring in these learned-looking foreign pages as a great "discoverer"! But the feature of the book that most commends itself to us is the evidence adduced for the Baconian authorship of Marlowe's plays. This lead should certainly be followed up. It will simplify several matters when it is generally understood that the whole traditional list of Elizabethan poets, philosophers, and statesmen is only a kaleidoscopic hoax under which Lord Bacon chose to "half conceal and half reveal" his Protean identity.

The book under consideration is a large octavo of 264 pages, printed in Cotta's best style, on heavy tinted paper, and inscribed by permission to Kuno Fischer, the well-known Heidelberg Professor of Philosophy, on the ground of his services to the memory of Lord Bacon. So imposing, in fact, are the book and its credentials that it almost makes one shudder to think of treating it with anything like levity. Upon reflection, however, we see no real ground for compunction, since the true Baconian always courts and glories in the fate of all great deliverers, the blessed privilege of suffering ridicule and obloquy for the truth's sake. Any attempt on our part to take Count von Eckstädt and his sect seriously would surely be worse than futile; but if this notice should fall under the eye of any reader, not yet a Baconian sectary, who has had his private struggle with the Baconian *crux*, we recommend him to read over, in default of anything better, Prof. Baynes's article on Shakspere in the new 'Encyclopædia Britannica.' Then, after making liberal allowance for what is mere unverifiable filling-in by the writer's fancy, let him put to himself this question: Is it possible to imagine for a man who was to write "Hamlet" and "As You Like It" a better birthplace, a more fortunate parentage, more efficient schooling, or more toward youthful experiences than those which actually fell to the lot of William Shakspere?

Calderon und seine Werke. Von Engelbert Günthner. Mit Calderon's Bildniss. Freiburg im Breisgau: Herder. 1888. 2 vols., pp. xl, 336; pp. viii, 438. 8vo.

THE last ten years have brought us a goodly number of more or less important contributions to our already considerable literature on Calderon, most of them called forth by the increased interest in the poet awakened by the two hundredth anniversary of his death, which was celebrated not only in Madrid, but throughout the European world of letters, on the 25th of May, 1881. Morel-Fatio's exemplary critical edition of "El Mágico Prodigioso" (1877) was followed by Dr. Max Krenkel's 'Klassische Bühnendichtungen der Spanier,' containing in three volumes four very ably edited but rather too heavily annotated plays of Calderon (1881–7), and by Norman Maccoll's 'Select Plays of Calderon' (1888). Among the more recent translations of our poet may be noted here Dr. Franz Lorinser's 'Don Pedro Calderons de la Barca geistliche Festspiele' (1882–7), and A. Richter's 'Udvalgte Komedier af Don Pedro Calderon de la Barca' (1880–7). More numerous, however, than critical editions and translations are publications concerning the biography of the poet, the sources and literary value of his works, and the character of the times in which they were produced. In 1880 appeared the learned Dutchman J. J. Putman's book, 'Studiën over Calderon en zijne Geschriften,' treating of the poet's life and works, and especially of the point of view he occupied in writing them. New facts of interest to Calderon's biography are brought to light, particularly by the Spaniard D. Felipe Picatoste, in his valuable monograph, 'Biografía de Don Pedro Calderon de la Barca' (1881), and also by the German E. Dorer in his essay, 'Calderon und die Hofprediger' (1887). D. Antonio Rubió y Lluch publishes a treatise on 'El sentimiento dal honor en el teatro de Calderon' (1882), and D. A. Sanchez Moguel one on the relations of the "Mágico Prodigioso" with Goethe's "Faust" (1881); while D. Adolfo de Castro y Rossi presents us with an interesting though necessarily incomplete picture of the social life of Spain in the seventeenth century as studied in the comedies of Calderon (1881).

To the above-mentioned contributions to the literature bearing on the great Spanish dramatist may now be added the work which stands at the head of this notice, and the principal aim of which, according to the author's preface, is "to render more accessible to a wider circle of readers the best works of the poet, by presenting, from an æsthetic and historical point of view, an analysis of the contents, together with the necessary explanations that would faithfully indicate the course of thought and the beauties of the Spanish original." Accordingly, of the one hundred and eight unquestionably genuine comedies, Günthner has taken up for thorough treatment all the religious and symbolical dramas, as well as such of the historical ones as are based on incidents belonging to Spanish history, selecting from the other plays and the seventy-three *autos sacramentales* only the most prominent, while the rest have been dismissed with a brief statement of their contents. The work opens with a pretty complete and unquestionably very useful bibliography of the literature bearing on Calderon, to which are to be added the illustrated and annotated edition by J. Alonso del Real (1881), mentioned on p. 27, and Norman Maccoll's 'Select Plays of Calderon.' Then follows—decidedly the best feature of the book—a succinct biography of the poet, which embodies the latest researches in the field, especially those of the above-mentioned D. Felipe Picatoste, and may be regarded as the most reliable account we now have of Calderon's life. Among other things it is worthy of mention that Günthner passes over in well-deserved silence that ballad of Cepeda's which for a time was supposed to be a production of Calderon's,

and as such figures in the biographical part of the editions of Hartzenbusch and Maccoll.

In the second and main part of the book—"Calderon's Werke"—our author first gives us a short account of the editions of Calderon, whereupon he discusses the different classifications of the poet's works adopted by editors and commentators, choosing for his own purpose the one introduced by Valentin Schmidt in his excellent work entitled 'Die Schauspiele Calderon's dargestellt und erläutert' (1857), and closes this brief general introduction to his work with a few remarks on the metre of Calderon's plays. In these it can only be regretted that, contrary to the well-established results of modern research, Spanish verse should still be forced into the Procrustean bed of the classical iambic and trochee. But what must even more disappoint the student of Calderon is, that neither here nor elsewhere in the book has the author availed himself of the opportunity to show that he has an opinion of his own in regard to the literary value of Calderon's drama and its relations to the dramatic literature of the times; all that we find concerning such important matters as these consisting in quotations from other, chiefly German, critics, the latter of whom Günthner joins in a somewhat more enthusiastic than just appreciation of Calderon's merits as a dramatist.

Indeed, there is very little that is original or new in Günthner's treatment of the subject. Throughout the whole work, whether in the general estimate of each class of plays or in the critical remarks on each separate play, he seems to have leaned altogether too much on his predecessors, especially on Valentin Schmidt and Von Schack, whose aid, it must be said, is always faithfully acknowledged. Schmidt's commentary contains copious and valuable notes on the grammar, phraseology, and other points of Calderon's language, and it would have been well for Günthner, who has here again contented himself with quoting from Schmidt and Krenkel, to follow the former's example, by bringing the results of his own reading to bear on the interpretation of the still considerable number of difficult passages in Calderon. His whole mode of treatment leaves one with the impression that he had confined his study of Calderon almost exclusively to the works of that poet and the recent literature bearing on the subject, instead of basing them on independent and broad researches in the whole domain of Spanish language and literature in the sixteenth and seventeenth centuries. But while Günthner's work contains few if any original views or new facts, it may be cordially recommended to the student of Calderon as summing up and arranging in a convenient form the results of recent research in regard to the life and works of the most celebrated of Spanish dramatists.

English Wayfaring Life in the Middle Ages (XIVth Century). By J. J. Jusserand. Translated from the French by Lucy Toulmin Smith. G. P. Putnam's Sons. 1889. 8vo, pp. 451.

No country offers a better field of operation to the historical inquirer than England. Scarcely a single phase of its inner, as distinguished from its political, history during the Middle Ages has been adequately investigated. There is no satisfactory history of its mediæval law, religion, commerce, industry, or municipal development. The abundance of accessible materials illustrating these subjects seems to receive more attention from foreigners than from Englishmen themselves. Many of the best contributions to English mediæval history have been made by such writers as Gneist, Pauli, Schmidt, Nasse, Von Maurer, Gundermann, Brunner, Von Ochenkowski, Schanz, Vinogradoff, Adams, and Bigelow. In no other country of western Europe has historical investigation been aided so much by foreigners as in England.

The book before us is a translation and expansion of a work which appeared in 1884, under the title of 'La Vie Nomade d'Angleterre,' etc. The author has taken advantage of the opportunity afforded him by this translation to revise the original treatise and to add about one-fourth of new matter.

The opening chapters describe the roads and bridges, the dangers and difficulties of travel in the fourteenth century (pp. 35–171). Then, in six different chapters, we are made acquainted with the life of the wandering herbalists, charlatans, minstrels, jugglers, and tumblers; messengers, itinerant merchants, and peddlers; outlaws, wandering workmen, and peasants; preachers, friars, pardoners, and pilgrims. The author points out how they served as links between the different groups of society:

"Pursuing their singular calling, these wanderers, who had seen so much and knew so many adventures, served to give some idea of the great unknown world to the humble classes whom they met on their way. Together with many false beliefs and fables, they put into the heads of the stay-at-homes certain notions of extent and of active life which they would hardly otherwise have had. Above all, they brought to the men attached to the soil news of their brethren in the neighboring province, of their condition of misery or of happiness, who were pitied or envied accordingly, and were remembered as brothers or friends to call upon in the day of revolt. At a period when, for the mass of mankind, ideas were transmitted orally and travelled with these wanderers along the roads, the nomads served as a true link between the human groups of various districts" (pp. 30, 31).

M. Jusserand shows that the condition of feeling among these wanderers, and the mode in which they carried on their businesses, were interwoven with the whole social condition of England; that in all the great social and religious questions of the age the part played by the wayfarers, though little known, was not insignificant. The wandering laborer breaks the fetters which for centuries had bound him to the manor. The begging friars and pardoners grow rich on the alms of the people; but by constantly addressing the masses they end by exposing themselves; by making the crowd of its own accord condemn them, they render religious reform inevitable.

"Besides, each of these strange types deserves to be taken apart and considered not only in relation to the masses, but in itself, too; for each shows very apparently in his own person a characteristic side of the tastes, the beliefs, and the aspirations of the times; through them we may examine, as it were, one by one, the souls of the people and reconstitute them entirely; just as the nature of the soil may be guessed from the flora of a country. . . . For good or evil it may be said that the wanderers acted as 'microbes' in mediæval history, a numerous, scarcely visible, powerful host" (pp. 407, 408).

Both the plan and the execution of the work deserve high praise. The range of sources used is very wide: Rolls of Parliament, Statutes of the Realm, local histories, and publications of learned societies have been critically sifted, and have yielded a rich harvest. Matters of much general importance are incidentally discussed. Many portions of the work are at once amusing and instructive. The book is adorned with many excellent illustrations; its typography and general equipment are admirable.

We have noticed very few errors. The author confuses frank-pledge with the Sheriff's tourn (pp. 113, 133): the former was only a part of the business of the latter. "Coram Rege Rolls" ought not to be identified with "Assize Rolls" (pp. 266, 267); the former contained pleas held before the King, while the latter recorded pleas held before the justices itinerant. A more correct transcript of the document concerning London Bridge (pp. 413, 414) will be found in Hardy's edition of the Rotuli Literarum Patentium (p. 9). According to the latter, "vobis" should be substituted for "nobis" (p. 414); "forisfecerit," for "foris faciat"; "Molinell" (= Molineux), for "Molmell." In connection with the subject of fraternities that maintained bridges and roads (p. 44), the "gilda de ponte" of London should have been mentioned; also, the "Corporation of the wardens and assistants of the bridge of Rochester." There were also certain gilds in Bristol and Ludlow which performed these functions. On page 84 attention should have been called to the numerous grants of "pavagium" contained in the Patent and Charter Rolls. Better or supplementary authorities for matters discussed on pages 238, 240, 246, and 267, are 'The Libell of Englishe Policye' (ed. Hertzberg), Lappenberg's 'Geschichte des Englischen Stahlhofes,' Kitchin's 'Winchester Fair,' and Andrews's 'Punishments in the Olden Time.' What is meant by the words "all the cases submitted for the decision of the justices in eyre" (p. 111), is not quite clear. Perhaps "all cases amenable to the jurisdiction of the justices in eyre" is the idea intended to be conveyed to the reader. The following passage is very obscure:

"Justice travelled not only in the King's suite. She was peripatetic in England, and *the magistrates from London* who had to bring her into the shires, as the sheriffs and bailiffs into the boroughs within their counties, periodically went around the country redressing wrongs. But grave abuses also slipped into *these institutions;* and, in spite of the precautions which had made *the men under the jurisdiction of the sheriffs and bailiffs* themselves the judges of these officials, numerous statutes one after the other had to declare some practices culpable and to stop them, for a time" (pp. 112, 113).

The words that we have italicized are obscure or ambiguous. The sheriffs and bailiffs of the King were excluded from exercising jurisdiction in the principal boroughs of England in the fourteenth century. But such obscurities and mistakes are rare in the volume before us. On the whole, the translation appears to be excellent.

An Investigation as to the Causes of the Great Fall in Prices which took place coincidently with the Demonetization of Silver by Germany. By Arthur Crump. Longmans, Green & Co. 1889. 8vo, pp. 198.

The main object which Mr. Crump, the author of several previous financial and economic publications, proposes in this book, is (to use his own words) "to produce a result which shall be, as near as possible, a demonstration that prices [in recent years] did not fall owing to a scarcity of gold, but that they did decline owing to other causes, which are definitely assigned as having produced the fall in each case, apart from other and more general causes which will have affected all to some extent." We fail to find much that is new in it, and Mr. Crump, although evidently understanding his subject, fails oftentimes to express himself clearly, as will, indeed, be evident from the above quotation which we make from his preface. He follows and endorses the facts and reasoning in respect to the cause of the decline of prices set forth by Mr. David A. Wells in the well-known series of papers "On Econo-

mic Disturbances," published by the latter during the past year—reprinting nearly the whole of one paper, and recommending Mr. Wells's "ordinary and simple" explanations to those economists who so persistently "invoke complex agencies," with the result that they "worry the scientific world with the everlasting sound of their fog-horns." Following also a similar law of investigation, Mr. Crump gives a very detailed commercial history of the supply and demand of *tea* as far back as 1863, as showing that, in the case of this great staple commodity, a price movement in the direction of a decline, and extending over many years, can be clearly and unmistakably explained "without searching in the currency domain for any subtile or obscure causes."

One view taken by Mr. Crump, which we have not before seen advanced, and which strikes us as not improbable, is, that had the mints of the world been open to "private coiners," or the free coinage of silver, "as was the case before the Latin Union took fright, the silver coins would probably by this time have bought less of commodities than they now do; supposing always that the general collapse of prices which we have seen had come about"; the closing of the mints having (after the manner of dams) restricted the supply of silver "from pouring into circulation."

Speaking of the influences which are influential in economizing or supplementing the use of metallic money, Mr. Crump uses this illustration:

"Confidence annihilates money. In our day, the amount of metal money required diminishes in an inverse ratio to the increase in the magnitude of the operations. The country shopkeeper will not trust the village blacksmith with a shilling's worth of nails for horseshoes unless he produces the coin. In the London Stock Exchange the aggregate operations of the fortnight, as shown by the Clearing-house returns, reaches from £150,000,000 to £200,000,000, all of which is settled without the intervention of a single gold sovereign. With the growth of the telegraph system, money in the shape of metal has been—in proportion to the growth of operations in which money plays a part—diminishing like dew before the rays of the sun."

Mr. Crump considers that the "case for bimetallism" has so completely broken down that "it is hardly worth while to discuss the schemes of its supporters"; and in this he is certainly in line with the London *Economist*, which, in its issue of November 17 last, expressed the opinion that if trade should revive in Great Britain, "bimetallism will soon die a natural death."

Letter-Book of Samuel Sewall. Vol. II. [Collections of the Massachusetts Historical Society. Vol. II—Sixth Series.] Boston: Published by the Society. 1888. 8vo.

THERE is very little of interest or value to the student of our colonial history in this volume of Judge Sewall's letters. They were all written in the latter and comparatively inactive part of his long life, when his mind was more intent on his private affairs, his ailments, and the theological questions of the day than with matters of public moment. We doubt whether there will be found anything of importance, even for the genealogist. Here and there, however, there are incidents related or allusions made which recall the entertaining diarist of provincial New England. In a letter dated March 2, 1714, he protests against the acting of a play in the council chamber at Boston, affirming that even the Romans, fond as they were of plays, were not "so far set upon them as to turn their Senat-House into a Play-House." "Let not Christian Boston," he concludes, "goe beyond Heathen Rome in the practice of shamefull vanities." It is possible that Gov. Francis Nicholson and his troublesome secretary, Netmaker, were at the bottom of this project, which we presume was not carried out. The incident is of interest, as being one of the earliest, if not the very first, reference to a dramatic performance in this country.

Six years later Sewall writes to the provincial agent, Jeremiah Dummer, at London, thanking him "heartily for the effectual care you took to prevent the passing the Bill that was to forbid our making of Iron. 'Twas one principal article of the forlorn Condition our Aborigines were in, that they wanted the use of Iron: And to deprive the Planters of it, would be to reduce them to the Miseries of the Iron Age." There is a very brief allusion to a scheme of the Rev. Thomas Prince for a "Lending Library" which Sewall characterizes as "inconvenient." That the old man's thoughts towards the close of his long life turned fondly back to the home of his childhood (he was born and his youth was passed in England), is shown by the memorandum of an inquiry of his London agent, "whether Nightingals would bear the Cold of our Winter, what the Cost of a Cock and Hen," and "Desired Mr. Balston to bring me over some Primrose Roots in a Box with Earth." A few months before his death, Gov. Burnet "sent Andrew to me with his Violin. I was refreshed by many of his Tunes; he plays well, yet his Tunes are too gaudy and Luscious, that the Tune doth not appear so plainly as it should. I was stricken with Horror at the Tune and Relation of the Murder of Glencove [*sic*] by Soldiers in their Quarters at Midnight in their beds, who treated their Guests kindly."

In addition to the Judge's letters, there are given a few pages of extracts from his son Samuel's "Memorandum-book," chiefly melancholy notices of deaths and funerals. There is a short introduction by the editors, calling attention to the most interesting letters in the collection, a few brief and unimportant notes, and an excellent index. In the introduction the editors suggest that another volume might be published of Sewall's letters which are not contained in his Letter-book. Unless they are far more interesting than those in these two volumes, we believe this would be unwise. A catalogue of them, with a short description of each, would answer every purpose. We are glad to learn that this plan is being carried out with the Pickering manuscripts, which are in the possession of the Society. An analytical index of them is being prepared with great skill and care, which, if it should be printed, would give greater assistance to historical students than the publication even of all the letters and documents in full, if that were possible.

The Story of Washington, the National Capital. By Charles Burr Todd. G. P. Putnam's Sons.

THIS volume of the "Great Cities of the Republic" is divided into two parts, the Historical City and the Modern City. In the former, the author shows how the city in its situation was the result of a compromise, what were the first beginnings, what grand intentions the fathers of the city had, how the city was laid out; describes its appearance in the early days, the capture by the British, the effect of the war of the rebellion, and the city subsequent to that time, which Mr. Todd aptly terms the Renaissance. The second part is given up to a description of the various public buildings, with the officers of the Government, the churches, the schools, the Washington Monument, and the chief features of Washington journalism.

Parts of the work are singularly out of place, while other parts are by no means in proportion. How, for instance, did the "Battle of the Giants," as the author terms the anti-slavery debates in Congress, to which he gives a chapter, affect the city? The treatment of modern society is very meagre, but one page being devoted to official society, when nearly all the society the city has is official.

Several inaccuracies occur, as in the statement that the District has only fifty square miles, instead of sixty-four, or that the avenues of the city run from the chief buildings; does the author know the location of Georgia, Virginia, New Hampshire, and Rhode Island Avenues, and can he tell what building they start from? The water of the city, by some inexplicable mistake, is called pure. The Capitol is reported to be 751 feet long, or nearly one-fifth of a mile in length—a very short mile. The citizens, we are told, suffer no extortions of gas companies because of the city government; on the contrary, the citizens are subject to the demands of the gas companies, and the Commissioners are powerless before them. The city is in its government far from the Utopia which Mr. Todd calls it. The number of pupils in the High School is 500 more than is stated.

There are omissions too. A most instructive and amusing chapter could, we think, have been made from the works of noted foreign tourists in the United States, describing the appearance of the capital from epoch to epoch before the war. Mr. Todd does not hint that its shabby, dirty, and dreary condition was mainly due to the existence of slavery in the District and to the dominance of the Slave Power in national affairs. As to minor matters, when he speaks of the Soldiers' Rest, he might do as he has done with other buildings—mention that it is still in existence, and that it was once used as a factory for making canes of the wood taken from Mount Vernon. When he says that the dome of the Capitol is lighted for night sessions, he might tell the reader that when the houses are in session a flag waves over them, which on adjournment is taken down. He might give the source of Washington's statue in Statuary Hall, since he has accounted for all the others. There are numerous illustrations, one of Webster's reply to Hayne. The text says that the "Senate floor is densely crowded, and in the members' chairs are many ladies," but the corresponding cut shows the floor to be far from crowded, and no ladies are visible, except in the gallery.

The History of the Roman Republic. Abridged from the History of Professor Mommsen by C. Bryant and F. J. R. Hendy. Charles Scribner's Sons. 1889. 8vo, pp. 542.

STUDENTS and teachers of Roman history, even those who possess the original work, will be glad to have in their hands the present abridgment of Mommsen's Roman History. It is not in the proper acceptation of the word an abridgment, at least as we understand that word; for an abridgment is the original work shortened by the omission of unnecessary matter, with no changes in the wording except when necessary to the connection. The work before us is a paraphrase, very skilfully made, in the language of the editors, with the rather awkward feature of an occasional sentence quoted with inverted commas from the larger work. Skilfully as the work is done, it is almost unavoidable, in a book prepared in this

way, that there should be occasionable slips, obscurities, and defects of perspective. As an illustration, we have, p. 150, Hannibal brought as far as Fæsulæ in the spring of 217, "where he encamped." Then it goes on to say that, "stung by the sight of the devastation which marked far and wide the line of Hannibal's march through Etruria, Flaminius [who was at Arretium] hastily followed, and overtook Hannibal in the District of Cortona." From this the reader, if he got any idea of the geography at all, would certainly understand that Cortona was between Arretium and Fæsulæ. Here is an omission of facts; on page 158 we find an inverted order of events, coming from the necessities of condensation, and resulting in an actual contradiction: "Capua, Nuceria, Acerræ joined him [Hannibal], . . . but the important ports of Neapolis, Cumæ, and Nuceria remained faithful to Rome"—the last named events coming properly first in order. We are glad that the editors have abandoned Mommsen's perverse practice of dating all events by the year of the city. A very welcome feature of the book, alone worth its cost, is the list of authorities appended to every chapter.

Les Bardeur-Carbansane: Histoire d'une famille pendant cent ans. La Mission de Philbert. Par Jaques Nauroze. Paris: Armand Colin et Cie. 1889. 8vo, pp. 348.

If any parent or guardian of ingenuous youth shall take up this heavy and handsome volume and lay it down again because its title faintly resembles 'Les Rougon-Macquart,' he will make a great mistake. The work of M. Nauroze suggests that of M. Zola as distantly as Monmouth suggests Macedon, and resembles it not more than chalk resembles cheese. M. Nauroze has had, in fact, the young reader especially in his mind as he wrote, and his aim in following the history of a bourgeois family through the century 1750-1850 has been to show that, in spite of all reports to the contrary, the homely virtues of the fireside have been, and are still, traditional in France. It can hardly be said that this task was so necessary as to be inevitable, and yet one may be content to note that it has been well and pleasantly done.

The story begins at the home of Guillaume Bardeur, an honorable merchant of Rouen, in his warehouse *le Vaisseau marchand.* It will evidently concern itself chiefly with the fortunes of his twin sons, Pierre and Jean, types of the artist and of the man of affairs; perhaps, also, of the Nord and of the Midi. In the book now in hand, the mission of Philbert, who is an old servant of Guillaume Bardeur, is to discover and bring back Bernard Savien, confidential clerk of the house, and betrothed of his master's daughter, whose sudden disappearance has made a vacancy in the shop which exactly concurs with a vacancy in the cash-box. Of course, Bernard is innocent, and is brought back and marries Nanine. But the search for him leads Philbert and the twins through camp and court and grove, and even to the Bastille, and brings them into the neighborhood of many illustrious persons, known and unknown to history. The court of Versailles is seen, and the cabarets of the Pont Neuf, the Place de Grève, the Louvre, the army of Soubise, the Academies and Academicians, the ateliers of Chardon and of Boule, the salon of Mme. Geoffrin.

Covering so much ground as this—and more, for the complementary story of Bernard is given, too—and being of the nature of an historical romance, the book cannot be said to have much, or any, value as a work of art; and yet it is a book pleasantly written and pleasantly instructive. It is indeed bulky, like a quartern loaf; but if this seem a fault to older palates, it will not suggest itself as such to the keen and omnivorous appetite of the young.

The English Restoration and Louis XIV., from the Peace of Westphalia to the Peace of Nimwegen. By Osmund Airy, M. A., one of H. M. Inspectors of Schools. With three maps. [Epochs of Modern History.] London: Longmans, Green & Co.; New York: Charles Scribner's Sons.

This is a genuine "Epoch" book—that is to say, it is not, like some volumes of the series, a mere chapter of English history, but aims to sketch the complicated events of the period as a whole, as they occurred in the several countries side by side. To be sure, it does not cover the entire field of history for its epoch. It is concerned wholly with western Europe in the time between the treaties of Westphalia and Nimwegen, and takes no account of that important series of events, in the east of Europe, which centred in the treaty of Oliva—a treaty as important, for those States, as that of Nimwegen was for the west. We find no fault with this. An attempt to combine the two series of events in one sketch could only have resulted in confusion and lack of unity, and the contents of the present volume form an eminently compact and united whole.

How completely this is an epoch, and not a chapter of English history, is shown by the fact that only seven chapters out of twenty-two are distinctively English chapters, although several others are partly devoted to English affairs. This is a positive merit. France and Louis XIV. formed the controlling influence in Europe at this time; Charles of England was contented to be a mere hanger-on of his cousin. The reader therefore obtains a more truthful idea of the period by noting that in it England played a wholly secondary part. From this point of view, the introductory chapter, upon the Peace of Westphalia, is of unusual excellence.

The maps possess the same merit. The first map, of Germany, shows by the use of colors the territorial changes wrought by the Peace of Westphalia. The second, of the Netherlands, exhibits clearly the acquisitions by the treaty of Aix-la-Chapelle, and especially the strategic frontier obtained by the treaty of Nimwegen—a point of view made prominent in the introductory chapter. The third illustrates the campaigns upon the upper Rhine.

The features which we have pointed out will serve to show the peculiar merit of this book. This age was the Age of Louis XIV. The treaty of Nimwegen is the central diplomatic event of this age. A book, therefore, which clearly and concisely describes the steps by which the great power of Louis was established up to the time of this treaty, places before us in small compass that group of facts which, from the point of view of general history, was the leading group of facts for the last half of the seventeenth century. We should add that the chapters devoted to English affairs are equally good, being, like the whole book, fresh and suggestive in both matter and style.

This excellent series has dragged very much of late. We do not understand why we have not yet any volume upon the Anglo-Saxon period, or upon the reign of George III., except the American and the French Revolution, in both of which English affairs are, of course, wholly neglected. Two or three additional volumes for the eighteenth and nineteenth centuries, from the point of view of English history—a precedence which for this period England has a full right to claim—would be very acceptable.

Ancient and Modern Lighthouses. By Major D. P. Heap, Corps of Engineers, U. S. Army. Boston: Ticknor & Co. 1889.

Major Heap's work is made up of a series of papers which were originally published in that excellent periodical the *American Architect and Building News.* There is a peculiar fascination about a lighthouse, especially to one who approaches such a building from the sea by daylight and in calm weather, and this work will not dispel the charm. In his opening chapter Major Heap gives a very readable account of the lighthouses of the ancients and of the Middle Ages, and next passes to the history and construction of the famous Eddystone buildings, of which the present is the fourth. Passing over the interesting accounts of the Bell Rock, Skerryvore, and other buildings with submarine foundations, we come to the principal lighthouses on our own coast. We have excellent accounts, with plans and drawings, of the towers on Minot's ledge, Spectacle Reef, Tillamook Rock, and the N. W. Seal Rock. We may note that the difficulty of constructing the well-known building on Minot's ledge in Boston harbor was greater than in the cases of the Eddystone, Bell Rock, or Skerryvore towers, the present building taking the place of one destroyed by a great storm in April, 1851. Special chapters are devoted to skeleton iron lighthouses, to miscellaneous lights of all kinds, and finally to lighthouse administration. The work is agreeably written and beautifully illustrated; in fact, we may consider it as a popular scientific treatise in which an attractive subject is set forth in a very attractive manner. The accounts of the difficulties attending the erection of the various lighthouses, and of the modes in which those difficulties were overcome, are full of exciting interest. We can congratulate Major Heap on the production of a thoroughly good and permanently valuable work.

By-Ways in Bookland: Short Essays on Literary Subjects. By Wm. Davenport Adams. Lockwood & Coombes. 1889.

The pleasant series of volumes for the book-lover to which this collection of short essays belongs, quietly bound and beautifully paged, has included no more agreeable book. These essays are literary diversions—light, refined, and exacting nothing from the reader. They have no air of instruction or utility; they merely entertain. The subject, generally speaking, is minor verse of the familiar, unsentimental sort; or, if there be sentiment, it is the sentiment that smiles at itself; the verse of clever wits, of humorous confidences, always with a touch of comedy. The London Season and the Recess, Matrimony, "The Not Impossible She," The Praise of Thames, Parliamentary Eloquence, Epigrams on the Stingy, are specimen topics; and interspersed with these are essays upon such matters as the English adaptations of 'Don Quixote,' the attempts of Charles Johnson—"famous for writing a play every year and being at Button's coffee-house every day"—and of George Sand to represent *Jaques* in love, or upon the trials of reading in bed, the subscription of letters, and postscripts. In such a varied collection the substance is necessarily quotation, and the pleasure is often that of being reminded of the good things we have forgotten. It is thus that one comes on Colman's lines:

"My muse and I, ere youth and spirits fled,
Sat up together many a night, no doubt,
But now I've sent the poor old lass to bed,
Simply because my fire is going out."

That is an old favorite; but does every one know Aubrey de Vere's exquisite quatrain?

"For me no roseate garlands twine,
But wear them, dearest, in my stead;
Time has a whiter hand than thine,
And lays it on my head."

Mr. Adams's book is preëminently one of those in which the author is the unobtrusive editor, like a friend drawing from the stores of anecdote and reading, repeating an old tale at times, but not to our tedium. Unlaborious minds will enjoy it best, the likers of "a slight thing" of cleverness. Its final postscript, "a certain Mr. O. to a recent Bishop of Norwich," we have not seen printed before: "Mr. O——'s private affairs turn out so sadly that he cannot have the pleasure of waiting upon his lordship at his agreeable house on Monday next.—N. B. His wife is dead."

Foreign Visitors in England. By Edward Smith. A. C. Armstrong & Son.

Field and Hedgerow. The Last Essays of Richard Jefferies. Longmans, Green & Co.

HERE are two widely different books, yet possessing at least one point of resemblance. Mr. Smith quotes all kinds of opinions of English manners and customs from the letters and books of more or less distinguished visitors, beginning with Von Rozmital in 1466, and coming down to Voltaire in 1730, Hawthorne in 1854, and Taine in 1872. The quotations are intelligently made and are decidedly interesting. It is curious, for instance, to find that Voltaire was as much impressed with the need of an English Academy as Matthew Arnold in these later days; and in reading Mme. Bocage's unsparing criticism of the London statues in 1750, and the Abbé Le Blanc's remark about the portrait-painters of the same period—that they "practised this noble profession as the meanest trade, for money alone, without the least ambition of fame"—one is reminded of the fact that in England changes come very slowly. Referring to the lack of cheerfulness in English society, the Abbé makes the statement that "there are families of them that have never laughed for two or three generations." The latest of the foreign visitors is M. Philippe Daryl, who writes in 1884 that in the House of Lords there are scarcely thirty politicians worthy of the name; and although a good deal might be said in favor of this proposition, it arouses the ire of Mr. Smith. For although this gentleman quotes all manner of opinions with judicial impartiality, he does not hesitate to express his contempt for those visitors who have failed to appreciate whatever is distinctively English.

Here and there in these last essays of Richard Jefferies we find a similar note of satisfaction with various things in that they are English, and a certain suspicion of all things that are otherwise. Except in this one matter, the two books are very different. It is perhaps not too much to say that Richard Jefferies was as passionately in love with the glories of nature as Wordsworth himself; and yet his writings are almost entirely in prose. How much English literature has lost by his early death will never be known; but no one can read this volume, with its delicious descriptions of country sights and sounds, and its records of the slowly changing seasons, without regretting that so keen an observer and so true a poet is gone. Unfortunately he did not realize in time that his special gift was the power to see and describe such things; unfortunately, too, he was unaware of his limitations in other directions. When he takes up such questions as the balance of trade and the competition that the modern English farmer has to face, it is easy to see that he is out of his element; but it would be hard to find elsewhere such beautiful word-pictures of English country life and scenery as he gives us here. Their charm cannot be conveyed by brief extracts, so the reader must go to the book itself and rest assured that it is worth his while.

Constitutional Government in Spain. A Sketch. By J. L. M. Curry, LL.D., late Minister of the United States in Spain. Harper & Bros. 1889.

IT is an honorable tradition which demands of the American Minister to Spain some literary fruit of his residence in that country, and this little book of Dr. Curry's is only the latest instance of bowing to it. He writes with clearness and vigor, and is able to convey much of the enthusiasm with which it is evident that he himself came to the study of a new subject. A great historical or political value he himself would be the last to claim for his pages. Those whose reading will enable them to clothe his outline with the needed details, are already beyond his help, while it may be doubted if his outline is sharply enough drawn to satisfy one coming to the topic for the first time. There would always be, to be sure, the possibility of falling back on Dr. Curry's own word, and remembering the conclusion which he reaches, viz., "With all the undoubted drawbacks, the drift in Spain is not strong, not consistent, but hopefully towards constitutional principles, promoting the general good while conserving individual rights." That is undoubtedly true. The only thing like unfairness which we have noted in the book is the failure adequately to state the aims of the existing conservative party in Spain. Sagasta contributes a chapter setting forth the Liberal programme, and in it says that the Conservatives have really no policy of their own, but are simply maintaining an expectant and negative attitude. This is too partisan a statement. Cánovas would certainly not assent to it; nor would the facts bear it out. Four appendices give sketches of some of the notable Spaniards of the century, some details of Spanish legislation, and an account of our acquisition of Florida—the last reprinted from the *Magazine of American History.*

BOOKS OF THE WEEK.

A Dreamer of Dreams: A Modern Romance. D. Appleton & Co. 50 cents.
Angerstein—Eckler. Home Gymnastics for the Well and the Sick. Illustrated. From the eighth German edition. Boston: Houghton, Mifflin & Co. $1.50.
Bartlett, T. Heart Stories. G. P. Putnam's Sons. 75 cents.

The Nation.

NEW YORK, THURSDAY, APRIL 11, 1889.

The Week.

THE action taken by the Vermont delegation at Washington in designating by unanimous vote the persons to be appointed as Collector of Customs at Burlington, United States District Attorney, United States Marshal, Bank Examiner, and Pension Agent, leaves the President very little to do in that State. If similar action were taken by all the State delegations, the time at his disposal for public receptions and hand-shaking would be very much enlarged. It is quite true that this course was suggested by the President himself when he told Mr. Niedringhaus, M. C. from Missouri, that he would like to have the Republican Congressmen from that State get together and designate the men they wanted to have appointed as consuls and foreign ministers. However harmonious, therefore, the joint action of President and Congressmen may be, it is necessary to point out that the plan of action involves substantially an amendment of the Constitution without the formula of submission of the same either to the people or to the State Legislatures. "The President shall nominate, and by and with the advice and consent of the Senate, appoint," all officers, is the language of the present Constitution. "The Congressmen shall nominate, and the President shall thereupon appoint and the Senate confirm all officers," would be the language of the Constitution thus surreptitiously amended.

It should be noted, also, that this is the first time that such a practice has been reduced to form. However much yielding there may have been heretofore on the part of the Executive to Congressmen, there has been nothing like an admission by the President of a right on the part of Congressmen to make a chart of the State patronage for the President to follow. When the Pennsylvania delegation, in Mr. Hayes's term, met at the instance and request of Secretary Evarts and designated Simon Cameron for Minister to England, the President refused to send his name in. When, a few days later, the Illinois delegation, at the like instance and request, met and designated Col. Ingersoll for Minister to Berlin, the Secretary himself refused to send the name to the President. It is quite probable that the present Ohio delegation would have voted unanimously for Mr. Halstead as Minister to Germany; and as this corresponded with the President's inclinations, the name would have gone to the Senate and would have been rejected, and thus the surreptitiously amended Constitution would have been broken at the start. We think that the present Constitution should be followed and obeyed in letter and spirit until it is amended in the way provided in the instrument itself. If it is inconvenient for the President to perform his constitutional duty of selecting ministers and all public officers, owing to the magnitude of the undertaking, the reform should be in the direction of an improved civil service, limiting the number of changes to be made to those which have a clear relation to and bearing upon the political side of the Government as distinguished from the administrative.

The editor of the *Iowa State Register* is Mr. J. S. Clarkson, who is not "on deck," however, at present, being entirely engrossed, as Assistant Postmaster-General, in redeeming the civil-service reform pledge of the last Republican National Convention by turning out efficient postmasters at the rate of hundreds a day, simply because they are Democrats and their places are wanted by hungry Republicans. Mr. Clarkson will probably read with some surprise a leading editorial article in his paper of Saturday last on the New York appointments, wherein appears this remarkable passage: "Mr. Van Cott, who was appointed Postmaster at New York to succeed Mr. Pearson, whose term had expired, *is said to have been connected with the Post-office for many years. His promotion, therefore, is in the line of true civil-service reform.*" This extraordinary blunder puts in its true light the disgraceful character of the change in the Postmastership. If for any good reason Mr. Pearson were to be removed, "the line of true civil-service reform," as the *Register* correctly says, required the promotion of some good and efficient subordinate, who had been "connected with the Post-office for many years," instead of bringing in from outside a spoilsman who had no experience whatever. No severer condemnation of President Harrison's act could be pronounced than was uttered by the *Iowa State Register* when it pointed out what his pledge to advance the cause of civil-service reform required of him in the matter of the New York Post-office, if for any reason he were not prepared to reappoint Mr. Pearson.

Considering that it is edited by an Extraordinary Envoy and professional diplomatist, the *Tribune's* treatment of Mr. Van Cott's appointment is very clumsy. It says in its local columns that, in appointing Mr. Van Cott, the President had "selected a Republican of whose party loyalty there could be no doubt;" that "Mr. Van Cott has been an active worker in behalf of the party in this city for over thirty years, has kept his district in line, and never failed to have it support the party ticket faithfully at the polls. In describing the effect of the news in the Post-office, it says it "created consternation among some of the employees of the Post-office who have been outspoken Democrats during the last four years, for Mr. Van Cott is known by them to be an ardent Republican." This same view is maintained by the Minister to France in the editorial columns, for it is there said that "Mr. Van Cott has been an energetic Republican politician all his life," that the President "has selected from among the leaders of his party an active politician, who is also a man of character and capacity," and that "party organization cannot be maintained by ignoring party leaders." So far all is straightforward admission that the new Postmaster is appointed in order to put the Post-office back into politics; and if the Ministerial Editor had stopped there, he would have shown the courage of his convictions, would have avoided all appearance of a disposition to "pander a little to the moral sense of the community," and would not have committed the diplomatic blunder of giving an excuse for what he had thus far argued to be a laudable action. But he went on and added: "It is a fact that the New York Post-office has declined in efficiency since 1885, and has not for years been in so unsatisfactory a condition as during the year 1888." In addition to being a grave diplomatic blunder, this is a bald untruth, which will be recognized as such on sight by every man who reads it.

New York is obviously entering upon the most remarkable "spoils" era in its history. On the Republican side the President, in cordial alliance with "Tom" Platt, is making arrangements to turn over all the Federal offices and patronage to the "Boys" for the purpose of building up a Republican Machine which shall carry everything before it. The scheme includes the building of a grand Republican hall, as a rival for Tammany Hall, and for this all the good business Republicans, like the famous John F. Plummer, are contributing generously of the money which they make out of the high tariff. This hall will give the reorganized and multiplied Boys a headquarters worthy of their Machine and its purposes; and the Post-office, Custom-house, and other branches of the Federal service are expected to furnish thousands of workers with good "places" and the means of subsistence. On the Democratic side, Mayor Grant, as the representative of Tammany Hall, is working hand in hand with Gov. Hill to strengthen and extend the power of Tammany by using the city and State patronage in every possible way for Tammany's benefit. The Mayor's unrestricted power of appointment will give him unprecedented opportunities in this direction, and we shall be able to see how he is going to use them when he makes his first batch of appointments on May 1. If the Legislature shall pass his Rapid-Transit Bill in the form in which he and the Governor desire—that is, giving him the power to select all the Commissioners, and thus virtually control the matter—he will secure a plum of patronage which will be of enormous value.

It will be interesting to watch the effect upon public sentiment here of these two

onslaughts for "spoils." The leaders in both movements have not the slightest concern for the public interests or the public rights. They are all seeking the same object—that is, the building up of a machine which shall be powerful enough to control the vote of this State in the next Presidential election. "Tom" Platt has obviously convinced the President that, if he will allow him to distribute the New York patronage among the "Boys," he can build up an organization here which will make New York a Republican State in 1892. Now, as a matter of fact, New York cannot be made a Republican State without Democratic treachery; and that kind of aid will not be forthcoming in 1892 if Gov. Hill succeeds in his plans for constructing, with Tammany aid, a Democratic Machine which will nominate him for the Presidency. If he is himself a candidate, he will not consent to "trade off" his ticket in the interest of the Republican candidate. In other words, if both of these "spoils" schemes are carried out, there will not be a Hill and Harrison combination in 1892, but Hill and Harrison will be running against each other—one with all the city and State patronage behind him, and the other with all the Federal patronage behind him. But 1892 is a long way off yet, and before it arrives the prostitution of public trust involved in the double experiment may arouse an indignation which will seriously interfere with both plans. But that both plans are about to be put in operation, there can no longer be any reasonable doubt.

The latest news from Rhode Island shows that nothing except the State's constitutional requirement that a majority over all is necessary to elect any candidate to office, has saved the Republicans from defeat. If, as in all but a very few other States, a plurality had been sufficient to elect, the Democrats would now be shouting over a "great victory in Rhode Island," for their candidate for Governor has a plurality of 4,398. They have elected one of their candidates, that for Attorney-General, and their candidate for Governor is within a few hundred votes of a majority over all his three competitors. The Legislature is Republican by some dozen votes on joint ballot, but the House is Democratic. A year ago the Republicans elected their entire State ticket by about 2,000 majority over all, and secured 91 out of the 109 members of the Legislature; the Democrats having only 17 members and the Prohibitionists 1. The drop from a majority of seventy-three to a meagre if not bare majority is very significant. Like the vote on the State ticket, it indicates that something like a reaction is in progress in the State. Harrison's majority in it in November was over 3,000, and his plurality over 4,000.

The one striking feature of the recent municipal elections throughout the West is the great amount of independent voting. The party organs were sure after the Presidential election that the Mugwump was at last dead and buried, and that there would never be any more trouble from that objectionable personage. But here he is again, "alive and kicking"—smashing a Republican machine here, ousting a Democratic ring there, going in for the best men everywhere, without any regard to party labels.

In an interview in a morning paper, Mr. John A. Kasson, one of our Commissioners to the Berlin Conference on Samoan affairs, says that it is not to be supposed that Prince Bismarck will object to Mr. Bates as one of the American conferees merely because he wrote a magazine article saying that the German Government had lied to us, and that her sailors tore down our flag and trampled on it, and that no conference ought to be held until Germany had offered fruits meet for repentance, which she has not yet done. All such sayings, in Mr. Kasson's opinion, will be overlooked by a man of broad views like Bismarck. On this point we differ altogether from Mr. Kasson, but our concern is more with our own Government and our own standing among nations than with the Bismarckian frame of mind. How Mr. Bates can consent to go as a Commissioner after publishing the article is a mystery. How our Government can let him go after being made acquainted with the article, is a greater one. But greatest of all is the mystery of his appointment in the first place if our Government knew beforehand that the article had been written and would be in Berlin before the Conference could assemble. We assumed, when the article first appeared, that the appointment must have been made in ignorance of it. We are now informed that Mr. Blaine was made acquainted with the article beforehand. If this is the fact (and the retention of Mr. Bates as a Commissioner certainly points that way), the conclusion is plain that Mr. Blaine wants to widen the breach with Germany and not to close it. The refusal of Germany to receive Mr. Bates must have been anticipated and prepared for. Bismarck is not a man of meekness, but, well seated as he is, we do not believe that he could hold his place at home if he should consent to treat with a person who had said what Mr. Bates said of the German Government and sailors in the *Century* article. Another piece of news which has reached us, but upon less authentic information, is that another article by Mr. Bates on the same subject and in the same tone is to appear in the May *Century;* and that this, too, has been known all along to the Department of State.

A rather late-coming speech, but one that deserves commendation, is that of Congressman Butterworth of Ohio, on the anti-social and uncivilizing tendencies of trades unions which resist the use of labor-saving machinery. The speech was made on the item in the Sundry Civil Bill relating to the use of steam-plate presses in the Bureau of Engraving and Printing. The Senate and House disagreed as to the use of steam-plate presses, the former body passing the appropriation for their use, and the latter, being "nearer to the people," rejecting it. The upshot was, that the House consented to the use of the steam presses, provided that no payment should be made to the patentees of the machines, or only a nominal sum. Thus the Senate carried its point in appearance, and the House carried its point in fact. Mr. Butterworth's speech is published in the *Congressional Record* of April 2. It first goes over the grounds of the controversy, showing that the opponents of the steam presses were completely baffled by the tests made to show the character of the work done by the presses. "The experts," he said, "who were called by the organization which is seeking to have these presses thrown out, having placed before them a number of bills, a part of which were printed by the steam presses and a part by the hand presses—that part of each bill by an inspection of which they would be enabled to tell whether it was printed by hand press or by the steam plate-press being concealed, and the expert interrogated as to which was the better work—three times out of four selected the bill printed by the steam plate-press as being the better work, as it doubtless was." It was shown, moreover, that there are not hand-plate printers enough in the United States to do all the work, and that steam presses are an absolute necessity in private establishments if not in the Government offices. "The throwing out of the steam presses from the Bureau is, therefore, equivalent to creating a privileged class of workmen in the Government employ." Mr. Butterworth then enlarged his theme to take in Mr. Powderly and the Knights of Labor, and the practice of boycotting and driving non-union men out of employment, and gave the whole lot of anti-social and uncivilizing agencies a well-deserved lashing. It required no little courage to make such a speech.

It is necessary to point out that the smuggling in which the firm of Allard & Sons are implicated has nothing to do with undervaluations, or appraisements, or "sugar frauds," or tobacco frauds. It is simply a case of deception in the packing and transportation of goods, the same in kind as the smuggling of opium across the Manitoba frontier a little while ago. A good sleight-of-hand performer can deceive the most watchful persons by mechanical contrivances that nobody anticipates or suspects. Thus a valuable picture can be concealed between a mirror and its backing, and rich tapestry can be stuffed into the upholstery of a chair or sofa, just as a lot of opium can be conveyed in the interior of a single pumpkin in a farmer's load. The smuggler takes his risk, and, if he is caught, he must pay the penalty. It is safe to say that such smuggling goes on all the time, more or less, at all ports and in all countries which collect duties on articles containing much value in small bulk, whether the duties be levied for protection or for revenue only. The only way to insure perfect honesty in the importation of such articles is to repeal the duties. Of course, those who violate the law must be punished; but since it is the aim of the law to pre-

vent rather than to punish, it would seem to be the part of statesmanship to take away the motives and incentives to smuggling as far as the needs of public revenue will justify, and to put on the free list such articles as diamonds, laces, tapestry, pictures, and similar articles which most easily evade the customs laws. These things generally do not compete with domestic industry. The duties are therefore not protective, and they are not now needed for revenue. It should be mentioned that the purchasers of the goods from Allard & Sons paid the full price of duty-paid articles, and are entirely guiltless. But the law gives the Government a claim on the goods wherever found. They may, therefore, be compelled to pay the amount of the duties a second time, in which case they will have been swindled just as they might be by a counterfeiter or a confidence game.

Few decisions will have a wider influence for good on railroad investments than that of the Chancellor of Alabama in the case of the Memphis and Charleston Railroad. The East Tennessee, Virginia and Georgia Railroad, having acquired a controlling interest in the stock of that road, is charged with operating it in the interest of the owners of the majority of the stock, so that the minority of the stockholders are deprived of the advantages of its situation in obtaining traffic with all roads with which it connects. The object of the purchase by a railroad of the majority of the stock of another is to operate the latter as a feeder to itself. It is fully indemnified for any loss its investment suffers in the decreased earnings of the purchased railroad, by the destruction of competition with other roads, and by the *long haul*, over its own system, of whatever traffic is received from the road operated not with a view to the development of its proper traffic, but of that of the roads of its principal stockholder. The loss falls on the individual stockholders, the benefit inures to the railroad holding the majority of the stock. This the court refuses to sanction, and practically disfranchises the stock held by the controlling railroad as a voting power in the management, and places the control of the Memphis and Charleston Railroad in the hands of its individual stockholders, who hold it for the purpose of investment.

The following words, quoted from the *Times* of March 28, explain the grounds of the decision :

"If a corporation can purchase any portion of the capital stock of another corporation, it can purchase the whole, and invest all its funds in that way, and thus be enabled to engage exclusively in a business foreign to the purposes for which it was created. A corporation may without express authority acquire shares in another corporation in payment of or as security for a claim which is in danger of being lost through the insolvency of the debtor corporation, and, having acquired the stock, it may collect the dividends, but it is not authorized to vote upon the stock. The directors of a corporation have no right under any circumstances to purchase shares in the company with the company's money for the purpose of controlling the election of officers."

It must be remembered that whatever be the relation of a corporation to the State, stockholders as between themselves are joint owners in a joint enterprise, with only this difference between such associations and unincorporated ones—that it is part of the agreement that a majority in interest, and not of the number of the associates, has the sole government of the corporation. The power thus given to the majority in interest is abused by the railroads so as to deprive their individual co-owners, not only of any voice in the management, but of reaping the fruits of the joint enterprise, which is managed in the interest of the one principal stockholder. The private investor may use and exercise whatever judgment he possesses as to the natural advantages of the railroad in which he places his money; his foresight goes for nothing when the interest of another corporation requires the acquisition of the majority of the stock for its own purposes alone. Such purchases of the majority of the stock by railroads not only have effaced every principle of public law as to the scope of the corporate powers of public companies, but have invaded the domain of private ownership and rights.

The report of the State Comptroller gives the taxpayers of the State another opportunity to see what the course of the Legislature on the prison-labor question costs them. The deficiency in the prison department during the past six months is over $192,000, and indicates a deficiency for the year of $400,000. This is the price which the State pays for an annual failure of the Legislature to do its duty; or, to put it in another way, it costs the State $400,000 a year to allow its legislators to get on their knees to the professional labor agitators. Until this annual neglect began, the prisons were self-sustaining, even paying a surplus into the treasury, and the convicts were well disciplined and in better physical and moral condition than they had ever been in the State. Now there is not only this enormous deficiency, but the prolonged idleness of the convicts is having the inevitable results. The prisons are overcrowded, the convicts have to be kept in their cells, many of them becoming insane in consequence, and all of them suffering physically and morally to a deplorable degree. In the past six months thirty-seven convicts have been sent to the State Insane Asylum, an increase of twenty-two cases over the same period of last year. There are now more convicts in the State prisons than ever before, not through any increase in crime, but because the county authorities, who formerly sent convicts to the penitentiaries, finding that they are forbidden to keep them at work and must support them at the county expense, have thrown them upon the support of the State.

Jacksonville, Fla., has just afforded a fresh illustration of the fact that color prejudice is not a matter of sections or parties. Two or three of the leading hotels in that city are owned and conducted by Northern Republicans, and their patrons during the winter season are almost entirely from the North, and, of course, largely Republicans. Frederick Douglass recently visited Jacksonville, and a delegation of colored clergymen called on the Directors of the Sub-Tropical Exposition to ask that during his stay he be quartered at one of the first-class hotels. The directors, of course, had no control of the hotels, but suggested application to such as are run by Northern Republicans. The application was made, but it proved impossible to secure quarters in any one of them for the best-known colored man in the United States. The race question as thus presented was simply a matter of business, and the Northern managers of Jacksonville hotels filled with Northern guests refuse to admit a negro for the same reason that the managers of theatres in Brooklyn, "The City of Churches," to this day refuse a negro admission to any other part of the house except the upper gallery—because they think that any other course would hurt their business.

Now and then we perceive a feeble movement of bimetallism in some part of the world. The latest, and one of the feeblest, was an attempt in the German Reichstag to secure a pledge from the Government to the effect that if England would take the lead in restoring the double standard, Germany would join her. The Government nipped this project in the bud by refusing to entertain it at all, and at the same time expressed its entire satisfaction with the present gold standard.

The flight of Gen. Boulanger to Brussels to avoid trial on charges of treason, or treasonable plots, before the Senate, makes the political crisis in France a little more picturesque, but it is very difficult to say what it means. The suggestion that the Government has found damaging evidence against him among the papers, recently seized, of the Patrictic League may have some foundation, but it is not likely. His belief that the Senate would convict him on any charge is a much more probable and justifiable excuse for his flight. If he were convicted and sentenced to a long term of imprisonment, it would injure him seriously by removing him from the political arena during the canvass for the general election, and disqualify him for a seat in the Chamber. This of itself is reason enough for running away. What effect his flight will have on the French popular mind, too, it is hard to guess at this distance. Its fluctuations about Boulanger have been inscrutable. His lies about the Duc d'Aumale were expected to ruin him; so was his unlucky duel with M. Floquet; but he has come up smiling after both. During the war of 1870, M. de Mazade claimed for France, in the *Revue des Deux Mondes*, a continuance of the "glorieux privilège d'étonner le monde," and she seems as ready to use it about Boulanger as about other things.

THE NEW YORK POST-OFFICE.

We do not believe the business men of this city are aware what the restoration of the New York Post-office to the Republican "Boys" means, because the older men have forgotten, and the younger ones never knew, what it was sixteen years ago, when it was taken out of politics and made a business establishment.

In 1873 President Grant appointed Mr. Thomas L. James to the Postmastership. He had previously been Assistant Postmaster, and his accession to the highest place practically put an end to the old régime, under which the Post-office, like the Custom-house and Navy-yard, was treated as a place of refuge for ward "workers," in which they sorted letters at their leisure. In those days, the days of Isaac V. Fowler and "Pat" Jones, the Postmaster was no more expected to devote his time to the administration of his office than to the teaching of school. He was "in and out" during the day, but when in was almost exclusively occupied with "politics." To him the district captains sent their complaints against clerks or carriers or sorters who were lax or inefficient in their work at the primaries, and their demands for places for more energetic "heelers" who needed salaries while attending to their party duties. About the despatch of letters and newspapers, he concerned himself but little, and could not have concerned himself to any purpose. His knowledge of the Post-office machinery was slight, and the business of the Post-office was comparatively small. When letters were lost, or miscarried, there was not much use in complaining, because, even if the fault could be traced to any particular person, it probably could be easily shown that, even if he was a bad sorter or drunken clerk, he was a very valuable political worker. The delivery system, too, was unimportant and few people relied on it. Business men had their boxes, as in country towns, and sent for their own letters, and their friends and families living up town had their correspondence addressed to their care. A defalcation on the part of the Postmaster was not uncommon, and when discovered was passed over lightly. The culprit ran away or hid for a while, and his bondsmen, of course, made the loss good. Everything was done on an old-fashioned, good-natured basis. If the letters came to hand, well and good. If they were lost, they were lost in a world of accidents, and it was un-American to grumble over trifles.

When the new Post-office was built and Mr. James was appointed, we began for the first time to have a modern post-office, and to enjoy the latest appliances in the letter-carrying art. "Pat" Jones, who retired in 1873, was the last of the old school. Mr. James introduced modern methods. He gradually cleared out the Boys, got rid of the privileged drunkards, and established discipline and order. When he retired in 1881, he left us a model public office. Mr. Pearson, the assistant who succeeded him in 1881, has maintained his traditions and improved on his methods. The New York Post-office is now one of the institutions of which the country may be proud. The best English, German, and French post-office experts may learn something by inspecting it. It ministers to the comfort and convenience and business of the people of this city with extraordinary efficiency, considering that it has to contend with something unknown in any other civilized capital—powerful opposition to the conduct of Government offices on business principles. That is to say, there is among us, incredible as it may seem to foreigners, a very large and influential body of persons who are bitterly hostile to having the Postmaster appointed solely with reference to the careful and efficient handling of mail matter. With this every postmaster in this city has to contend, and will have to contend for a good while to come. Mr. Pearson, the late Postmaster, suffered severely from it. It prevented his receiving the proper support of his superiors under President Cleveland's Administration, and kept on foot constantly during the past four years movements for his overthrow, and for the promotion of a spirit of criticism and insubordination among his inferior officials.

This body has made an energetic and successful attempt to oust Mr. Pearson, not for the purpose of putting in his place another post-office official, if such could be found, of greater experience or higher skill, but for the purpose of giving the New York Post-office back to the same class of men who managed it fifteen years ago under "Pat" Jones, and this in spite of the following pledge in Gen. Harrison's letter of acceptance :

> "In appointments to every grade and department, fitness and not party service should be the essential and discriminating test, and fidelity and efficiency the only sure tenure of office. Only the interests of the public service should suggest removals from office."

The person who has got the place is Mr. Cornelius Van Cott, one of the old Republican Boys, brought here by Mr. Arthur in 1873, when he established his Republican Machine. He is a Republican Boy, belonging to the same category as "Jake" Hess, "Barney" Biglin, "Steve" French and the rest. We mean nothing derogatory to his personal character when we say that he has lived by offices of one sort or another since Arthur made him an Inspector of Customs, and has filled them all as a politician and not as a business man. Of post-offices we presume he rarely thinks except as places partly in the gift of the Postmaster-General and partly of the President, through which documents may be distributed in campaigns. That they should be conducted on business principles by non-political clerks we presume he considers a silly Mugwump dream. We are thus minute in describing him because we think a description of him gives a good idea of the sort of danger to which the Post-office is exposed.

No adequate notion of this danger can be formed without considering the enormous growth of the Post-office business under the régime established by Mr. James and perpetuated by Mr. Pearson. To go back only ten years to 1879, the increase is striking.

Number of pouches and sacks of mail matter received from and despatched to other post-offices in 1879	1,294,615
Ditto in 1888	3,741,218
Increase	2,446,603
Letters, papers, etc., delivered and collected by letter-carriers in 1879	224,589,132
Ditto in 1888	355,672,049
Increase	131,082,917
Amount of money-order business 1879	$43,652,273
Amount of money-order business 1888	85,057,565
Increase	$41,405,292
Registered letters and packages received and delivered, 1878*	1,924,884
Registered letters and packages received and delivered, 1888	6,457,235
Increase	4,532,351
Total receipts, 1879	$3,235,675
Total receipts, 1888	5,162,972
Increase	$1,927,297
Receipts over expenditures, 1879	$2,033,421
Receipts over expenditures, 1888	3,271,138
Increase net revenue	$1,237,717

We ask every inhabitant of the city who owes to the Post-office either domestic peace and comfort, or business security and prosperity, to remember, in view of these figures, that it is not the old Post-office of 1873 which the President gives back to the Boys, but an immensely enlarged and greatly improved and vastly more important institution, which is one of the glories of the city, and which it is scandalous now to surrender to the party bosses.

Mr. Van Cott, the new Postmaster, is reported in the *Tribune* of Sunday as saying, apropos of his management of the Post-office, "There will be no attempt to evade any law, neither shall it be forgotten that this is a Republican Administration." This little reservation is exactly like that of President Harrison's new Postmaster at Indianapolis, who said he would "obey the Civil-Service Law as far as possible." Mr. Van Cott's determination to remember "that this is a Republican Administration" must mean, and can only mean, that when he is making appointments he will give the preference to Republicans because they are Republicans, which is exactly what Postmaster Wallace meant when he said he would "obey the law as far as possible." But Mr. Van Cott, in making this reservation, overlooked the fact that the law prohibits his remembering, in his management of the Post office, that "this is a Republican Administration." It in fact makes it his sworn duty to forget it. Rule 8 forbids "the expression or disclosure," "in any examination or proceeding by or under the Commission or Examiners, of any political or religious opinion or affiliation, and any discrimination by reason thereof if known"; and the Commission and examiners are required to "discountenance" all such disclosures by the applicants themselves even, or "by any one whose name is on any register awaiting appointment." And the third section of the statute directs that the rules shall provide that "no person in the service has any right to use his official authority or influence to coerce the political action of any person or body." If, therefore, Mr. Van Cott so far remembers that "this is a Republican Administration" as to find out the political opinions of candidates in order to give Republicans the preference, he will violate the law. He will also violate the law if he dismisses, or threatens to dismiss, any employee, or refuses

* Figures for 1879 are not now accessible.

him promotion, on account of his political opinions. But that he will try to do so, that he will endeavor to evade and nullify the law in all ways which will not expose him to immediate criticism or condemnation, we have very little doubt.

The reason we think so is this: Mr. Van Cott is over fifty years old—an age at which men do not change their habits or take in new ideas. He not only has been trained in the spoils system, but has lived by it during his whole manhood. He has held various offices, but for not one of them has he been selected on account of his fitness, using that term in its business sense. He has probably pushed scores of men for office, but not one has he ever pushed on account of his fitness. He has got all the offices he has ever held because of his activity and success in doing some other and totally different kind of work —namely, political "work"; which is very much as if a man should be made a teacher of mathematics because of his success as a writer of lampoons, or should be employed as a cook because of success as a dish-washer or oyster-opener. He has urged the claims of many friends to places in the public service, but we venture to say he has never supported one on the simple ground that he had the special capacity and training which the place called for. All his own experience of life leads him to regard salaried Government offices as existing mainly to reward the political activity of political partisans, and, secondarily only, to do the work of administration for the benefit of the taxpayers at large.

The Civil-Service Law he doubtless considers, in agreement with nearly all men of his class, as a concession unnecessarily and unwisely made to the Mugwumps in 1883, on a false estimate of their strength and importance, and not taken seriously by practical politicians of either party, and, therefore, one which may now be properly disregarded and evaded to a limited extent. He is perfectly justified in regarding his appointment as an indication that President Harrison shares this view. For of course no lawyer or business man who did not share it, would think of charging with the duty of seeing that none but fit men got into a large public office, a man whose own career was a signal illustration of the needlessness of fitness, and who therefore might reasonably be expected to feel a contempt for it proportioned to his own success in getting on without it.

Considering that it was the Republican party which first took this great office out of politics—that is, out of waste, inefficiency, and fraud; that it was the Republican party which took a successful New York Postmaster, Mr. James, and, after eight years' trial of him, made him Postmaster-General — that is, head of all the post-offices; considering that it was the Republican party which then, before any Civil-Service Law was passed, took Mr. James's first assistant, and, on account of his eminent fitness and experience, put him in Mr. James's place; considering that when the Democrats came into power, and the hounds of faction made another desperate effort to get hold of the office again, Mr. Cleveland, at Mugwump solicitation, and in spite of "charges" against Mr. Pearson, kept him in his place, on the simple ground that no man in the country could fill it so well—considering all these things, it must be admitted that this appointment of Van Cott is the most deliberate and conspicuous exhibition of disregard for efficiency in the public service to which the public has been treated since the war; and it comes from a President who has been supposed in a peculiar degree to meet his official obligations under the most solemn of all sanctions.

RAILROAD MORTGAGES AND PRIOR LIENS.

THAT a railroad mortgage is not in every respect an absolutely first lien upon the property, has been long conceded. Taxes, for example, must be paid. Risk of forfeiture of the franchise from acts done contrary to its provisions is necessarily one which bond-holders must assume. In addition to these, early arose other claims for which priority over the mortgage was demanded. In the sixties, as our railroad system began to approach its present importance, and the possibilities of floating large funded debts became apparent, with the consequent great gains for the shrewd railroad organizer or dishonest speculator, the system of the appointment of receivers of bankrupt railroads by the courts was entered upon. New and complicated questions arose. Railroads burdened with mortgages far too heavy for the traffic to carry were brought one by one into court, with the request that the differences between income and fixed charges should be adjusted there. This sometimes required years of effort, and meanwhile two courses were open: one to proceed as in the case of a bankrupt merchant—stop the business and sell out the assets as speedily as possible; the other, to continue to operate the road pending the adjustment. Duty to the public, whose interest in these public highways is second only to that of the owners, would of itself lead to the adoption of the second plan. But operation means expense and machinery under the governance of the court for carrying it on. Hence the appointment by the court of receivers who should manage the property and issue certificates from time to time for the payment of expenses. These certificates issued under the orders of the court took precedence of the mortgages as claims upon the property, and were paid at foreclosure as part of the expenses of the court.

This common-sense view of the matter has legal authority. A mortgagee in possession may lawfully expend upon the property such sums as are necessary to preserve it. The early decisions nearly all give this as the reason for the validity of receivers' certificates. Later cases, however, seem to cover much more than the conservation of the property. Little by little—in practice if not in theory—we find expenditures easily passed which a strict construction of the original rule would not have allowed, until the popular meaning of a receiver has come to be one who, as an officer of the court in possession of the disputed railway, shall operate the same exactly as though he were the real owner, the court generally leaving the entire management in his hands. In Beach on Receivers this process is traced and set forth in condensed form.

But we have gone a step beyond this. Of several cases which might be mentioned, the most recent is the Farmers' Loan and Trust Company vs. the Cincinnati, Washington and Baltimore Railroad, tried in the Superior Court of Cincinnati. This was an action to foreclose the mortgages, at which the Baltimore and Ohio Railroad asked that its claim for $1,220,397.62 be made a lien upon the property prior to the Trust Co.'s mortgage. This was granted by the court. The C., W. and B. R. R. was reorganized in 1883, and since then interest upon the mortgages amounting to nearly $700,000 yearly has been paid. It was soon discovered that the traffic would not support such interest charges; these, however, were regularly paid and the shortage was carried in the following manner: An understanding was had with the B. and O. "in pursuance of which the officers of the C., W. and B. (one of which was also an officer of the B. and O.) from time to time purchased materials and supplies necessary for the operation of the road, the bills for which were paid with funds of the B. and O., and an assignment taken from the holder to B. and O." Upon these claims judgment was obtained by the B. and O. against the C., W. and B. in 1888. Nothing about this transaction was concealed, for the amounts of these claims for materials furnished were regularly given in the annual reports; in the general balance for December 31, 1887, for example, there is a credit item of $1,067,716.17 supplies furnished by B. and O.

The decision of the Court making this claim a lien prior to the mortgages, is based upon the laws of Ohio, section 3398 of Revised Statutes reading as follows: "The lien of mortgage and deeds of trust, authorized to be made by the preceding section, shall be postponed to the lien of judgments recovered against the company after its reorganization for labor thereafter performed for it, or materials or supplies thereafter furnished to it, or for damages, losses, or injuries suffered or sustained by the misconduct of its agents, or in any action founded on its contracts or liability as a common carrier thereafter made or incurred." This broad language as to materials or supplies furnished was broadly construed by the Court, contrary to some of the earlier decisions in cases of receivers' certificates, which insisted upon strict construction of all authority granted for their issue. It is clear that the moneys owed to the Baltimore and Ohio were really expended in the payment of interest to the bondholders. "The equity is much stronger," says the Court, "in cases like the present, where the earnings of the road for and during the time when the supplies were being furnished were applied to the payment of interest on the loans with which it conflicts."

This liberal statute of Ohio, and the Judge's language construing it, mark an important advance over the position of the earlier courts, which cautiously admitted the claims of receivers' certificates to be prior to mortgages. The principle thus pronounced of granting priority to claims for materials and supplies is a far-reaching one. In the first place, in the C., W. & B. case, under the terms of the statute, no question seems to have been raised or examination made as to these materials, whether they were such as were really essential to the operation of the road or not. It was taken for granted that they were such as would be bought under ordinary circumstances—which might be for betterments and improvements as well as not. English investors recognized this point some time ago, for in the (London) *Law Quarterly Review* for July, 1888, is an elaborate article upon railway mortgages in the United States, in which the limitations of receivers' debts are set forth and thoroughly insisted upon. Nothing is clearer than the fact that the admittance of priority over mortgages on the part of any other claim is an impairment of a contract, which is expressly forbidden by the Constitution of the United States. And yet, as we have seen, certain things like taxes do have such precedence. Hence follow the general rulings of the courts that receivers' certificates, when issued strictly for the preservation of the property and for the best interests of the bondholders, shall also have such priority. But where shall we define this limit? This is the all-important question. If we follow the older theories strictly, there is ground for thinking that the quoted statute of Ohio, with others like it, is unconstitutional, and will be so decided by the Supreme Court when a case involving that question comes before it.

The mortgages of railroads constitute the greater part of all the investments offered to the public, and the question of their absolute safety is most important. Out of four billions of dollars (our present railroad bonded debt), about one-quarter has suffered impairment or loss through foreclosure and reorganization during the last dozen years. This, indeed, is not as it should be, for the funded debt of a railroad should represent pretty accurately the minimum value of the property, and thus be beyond any ordinary loss, leaving the speculative fluctuating value to be represented by the stock. But the fact that a quarter of our mortgages has been in danger emphasizes still more the need of asserting the title and right to the property covered. If any and all expenditures can come before a mortgage, it only remains for unscrupulous men to take advantage of supplies furnished and betterments made, to obtain judgments, thus, as Beach well says, "improving the bondholders out of their property."

SPANISH-AMERICAN COMMERCE.

THERE were more glimmerings of sense in the speeches at the formation of the new Spanish-American Commercial Union of this city than we remember to have encountered in recent discussions of the South American trade. It is something to have got the square admission that the larger part of the firms who have attempted to secure a share of that trade have pursued methods which are wretchedly unbusinesslike and inefficient. This admission was distinctly made by Mr. Hughes of the Ward Line of steamships, and is amply borne out by consular reports and the testimony taken by the South American Commission of 1885. American merchants have shown the most fatuous disregard of the elementary principles of successful trade with Spanish-America; they have not consulted established tastes, have shipped goods either too poor or too good, badly packed, improperly invoiced, wrongly consigned, have selected incompetent agents, have given their "exclusive" trade to several houses in the same city, have refused to conform to the settled terms of credit and discount, have dealt with South American purchasers in the most lofty and contemptuous fashion, and then have gone about declaring that it is a shame the Government doesn't do something to enable them to make profits.

After the emphatic remarks of Mr. Hughes upon this part of his subject, it is disheartening to find him arguing in the same breath that nothing can be done without subsidized steamers. Perhaps he did that to avoid the charge of disloyalty to the interests of his steamship company. The thing one would have expected to hear him say is that if what stands in the way of our South American trade is the stupidity of American shippers, the trade would come as soon as they used the proper means to develop it. We have Mr. Hughes's own word for it that the trouble is not in the rates of freight; in an address given on another occasion he very correctly stated that the British tramp steamers would attend to that, and that one of them would appear wherever there was a profitable cargo. Would he simply give American merchants the chance to ship their unsalable goods a little oftener than they now can? "We don't need free trade to capture South American commerce," says Mr. Hughes. "All we need is reciprocity treaties admitting to our ports the raw materials of South America, and securing in return the free admission of our manufactures." This means free wool, if it means anything, but Mr. Hughes naturally did not want to blurt that out so soon after the last election.

This whole scheme of entrapping the South American republics into some sort of reciprocity treaty which they have no earthly reason for desiring, is particularly absurd after the flat failure of the Commission of 1885 to work any game of that sort. They were particularly instructed by Secretary Frelinghuysen to get a reciprocity treaty in every case possible, and they did not get within sight of a single one. Let any one read the account of their reception in Chili by the President of that country, and the remarks made upon their simple-minded efforts by the Chilian press, and he will not wish to have the United States get another repulse of that sort. The President "said it was out of no want of respect for the United States, for whom he and his people held the highest esteem, but it was his settled belief that all treaties were needless; that they subserved no valuable end, and that, in the matter of reciprocity, there could be no control of the laws of trade by any convention; that men would buy and sell where it was most to their advantage, and that this could not be aided or materially influenced by national compacts." We probably still need such elementary tuition, but it is rather humiliating to get it from a people whom we patronize so condescendingly.

Ex-Senator Miller added his wisdom to the debate of the evening alluded to, and gave it as his belief that, with a subsidized line of steamers to Brazil, our trade with that country would increase 100 per cent. within a year. Probably he never heard of the subsidy to the Garrison Line to Brazil, $150,000 a year for ten years; or, if he did, he must have failed to note that, while our exports to Brazil averaged $6,346,000 a year for the term of the subsidy, as soon as it expired, in 1874, an increase was at once apparent, the average exports for the next two years being $7,463,000. He might also have learned, if he had inquired of some of our merchants who do business with Brazil, that freights are now less than half what they were at the time of the Garrison monopoly.

President Harrison has so distinctly favored, both in his speeches and in his inaugural, the policy of subsidies, that the general hurrah by the expectant ship-owners since his election is not at all strange. We believe, however, that they have overlooked a very important element in the situation—the opposition which they will have to encounter from those Republican Congressmen who represent Western farming constituencies. Many of them would not vote even for the moderate proposition of Mr. Bingham of Pennsylvania last summer, although the madness of the impending election was then upon Congress, and party lines were tightly drawn. It is altogether likely that they will be even more ready to ask impertinent questions in the Fifty-first Congress, such as, Do these steamship lines pay any dividends? If they do, what are they complaining of? If not, why is not the capital invested where it will get a return? Very likely, too, some successor will be found to Mr. Nelson of Minnesota to say, as he did last year, that the shortest way for owners of steamships to increase their profits is to strike for free ships.

AN ENGLISH ESTIMATE OF AMERICAN ILLUSTRATION.

LONDON, March 21.

To all who are interested in bookmaking, book-illustration, and book-decoration this winter in London has been of unusual interest. There is no branch of art more popular to-day than illustration, and yet there is none so persistently ignored by writers on art. The fact that so much attention has been given to it in late lectures and exhibitions is therefore in itself worthy of note. But the manner in which the subject has been treated by the lecturers is of still greater significance, especially to Americans. A short analysis of the lectures and a slight reference to the exhibitions will make this clear.

The subject was first given prominence during the Exhibition of the Arts and Crafts So-

ciety held in the Grosvenor Gallery before Christmas. The very name of the Society, as well as the interests of its President, Mr. Walter Crane, made it impossible to omit from the show the art and craft of bookmaking. But, once accepted among the exhibits, it was somewhat of a surprise to find how very small was the space given to it. Several frames of drawings by Mr. Walter Crane, two or three of work by Mr. Heywood Sumner and Mr. Jacomb-Hood, and a few designs by Mr. Lewis F. Day, represented illustration and decoration as applied to books. The only examples of printing came from the Clarks and the Chiswick Press; the only specimens of bookbinding from Mr. Cobden-Saunderson and Messrs. Roger and Lorenzo de Coverly. When one paused to consider the large number of illustrators, designers, and publishers, the slimness of this part of the exhibition seemed altogether unaccountable. A slight clue to the reason for this slimness, however, was found on carefully consulting the introductory notes in the catalogue. Here the short paper on Printing ended with this paragraph:

"Next in importance to the type are the ornaments, initial letters, and other decorations which can be printed along with it. These, it is obvious, should always be designed and engraved so as to harmonize with the printed page regarded as a whole. Hence illustrations drawn only with reference to purely pictorial effects are entirely out of place in a book—that is, if we desire seriously to make it beautiful.'

This is really a sweeping condemnation of all the magazines and all the illustrated books, with a very few exceptions, printed at the present day. That it was so intended was confirmed by the series of lectures which followed the opening of the exhibition. In the lecture on printing—given, by the way, by a photo-engraver whose principal business it is to reproduce purely pictorial drawings for book-illustration—if the arguments were weak, the meaning was plain: the only good book-decoration and illustration is that done by the artists and craftsmen of the sixteenth century, and by a very small saving remnant, with Mr. Walter Crane for its leader, to-day; all other modern attempts at book-illustration and decoration are hopelessly and atrociously bad. We may consider it perhaps a compliment, certainly a proof of our influence in the art world, that for the atrocity and hopelessness Americans are held wholly responsible. Indeed, to listen to the dogmatists of the arts and crafts school is to believe that, beyond the small remnant to which I have alluded and the Americans, there are no modern book-illustrators and decorators. As far as they are concerned, Menzel and Wietz, Vierge and Montalti, Jeanniot and Habert-Dys might never have lived. During the lecture on printing, after all that is right in illustration was shown by lantern slides, the wrongness of American work was demonstrated by throwing on the sheet an enlarged page of *Harper's* decorated with some of Mr. Hamilton Gibson's flowers. As the original drawing was made in wash, it did not, as was to be expected, enlarge to such good effect as drawings made in line. But no one questioned the value of the demonstration; on the contrary, it was received with applause.

In its relation to book-illustration, the exhibition, narrow in its limits and arbitrary in its lectures, was chiefly significant because it for the first time definitely showed the attitude of Mr. Walter Crane and his friends and followers on the subject, and openly expressed their hostility to the methods of American draughtsmen, art-editors, printers, and publishers. Since the close of the exhibition, this attitude has been still more arbitrarily maintained, this hostility more fully avowed, in two series of lectures given before the Society of Arts, the first by Mr. W. J. Linton, the second by Mr. Walter Crane.

It is almost unnecessary for me to state that Mr. Linton's subject was wood-engraving, or that, however much one might disagree with many of his opinions and conclusions, one listened to him with that respect always commanded by the words of any workman upon the work to which he has devoted his life. Moreover, his lectures gave a full, clear, and concise history of the growth and development of wood-engraving, well illustrated by means of the lantern, which has become indispensable to the modern lecturer. That Mr. Linton's standard of wood-engraving is wholly conservative is a fact already well known in America. He, too, believes the Americans responsible for everything that is bad in modern illustration, though he casts the blame upon the new methods of the engraver rather than of the draughtsman. But, curiously enough, all the arguments he used in support of the old methods, if carried fairly and without prejudice to their logical conclusions, really prove the merits and rightness of the new school of reproduction.

His history of course began with the inevitable Egyptian stamp, continued with the Venetian playing-cards, the famous St. Christopher, the block-books, to the work of Dürer's time, which came to the very height of its perfection in the great arch of Maximilian. After the woodcuts of the sixteenth century, the historian of wood-engraving finds little to record until he comes to the work of Bewick and his followers and the perfected use of the white line, with which Mr. Linton's own name will for ever be associated. Up to this point Mr. Linton praised, as the chief virtue in the wood-cutter, his subjection to the artist—a subjection so complete that the names of many of the great engravers of the sixteenth century are now unknown. His business it was to reproduce, to the very best of his ability, the draughtsmen's lines, with intelligence, of course, but with absolute fidelity. If he thought the lines bad or unworthy of his graver, if he felt that he himself could make a better design, then, very possibly, he gave up reproducing other men's work and made his own drawings on the block. But so long as he reproduced the drawings of other men, then he realized that the design was of primary importance, and that he, the interpreter, was in every way subordinate to the artist.

Another reason, too, for the great work of wood-engravers in the past was their readiness, as well as that of the artists and craftsmen with whom they worked, to take advantage of every mechanical and artistic invention and development. The actual methods of the man who cut the St. Christopher and the engravers of Dürer's drawings may have been the same, but the great contrast between the early and later work shows that in the meantime the engraver must have been striving to increase his power in cutting his lines in proportion as the draughtsman was developing his skill. Nor was he slow to avail himself of the invention of movable type to lighten his labors. Instead of abusing the invention of printing as a mechanical substitution for the sympathetic and intelligent work of a craftsman—though, for all we know, there may have been conservatives in those days, too—he at once adapted it to his requirements, and ceased to cut the lettering as in the old block-books, but left the text which accompanied the drawings to be set up in type by the printer. The white line was a distinct innovation in wood-engraving, an entire change from the methods of the old engravers, and yet Mr. Linton, by his use and praise of it, shows that in certain cases and at certain times he recognizes innovation in and development of artistic methods to be necessary and commendable. But when it comes to our own times, then all change means to him degeneracy.

Of modern wood-engraving he seems to know only the American, for to the degenerate methods of to-day he gives the name of the "American New Departure." This is scarcely fair, even if his estimate is to be accepted. The devil should be given his due. Long before the production of the wood-engravings which have made the *Century* and *Harper's* famous the world over, Menzel, in his determination to obtain good reproductions of his illustrations for the Life and Works and History of Frederick the Great, had developed facsimile wood-cutting in Germany and France to a wonderful perfection. Besides, if among American wood-engravers are to be found such masters as Cole and Juengling, they are by no means greater than Frenchmen like Beaude, than the German successors of Unzelmann and Vogel, or even than Englishmen like Patterson, Swain, Cooper, and the Brothers Dalziel in their particular line.

But suppose all the credit of the new methods of engraving is to be given to the Americans, what is Linton's objection to them? This is really impossible to understand, for at the beginning of his second lecture, which was principally taken up with strong abuse of the "New Departure," he stated that with the reproduction of tone he was not concerned, as that was a distinct art. Now, the American engravers of to-day are as a rule—there are of course occasional exceptions—concerned only with the reproduction of tone. The invention of photographic methods of reproduction has revolutionized book-illustration in the nineteenth century as completely as the invention of printing revolutionized bookmaking in the fifteenth. Just as the printer then replaced the scribe, so, for line drawings, the photo-engraver has now supplanted the wood-engraver. And just as the scribe then saw the folly of competing with a machine which could do his work much better and more quickly and cheaper, so to-day the wood-engraver sees the uselessness of rivalling a mechanical process which will reproduce the draughtsman's lines more easily and accurately, and in a tenth or twentieth of the time it would take him to do the same work. Mr. Linton himself admits this: for his forthcoming work on the 'Great Masters of Wood-Engraving,' he is having all the woodcuts reproduced by process instead of making new ones. As yet, photo-engraving cannot equal wood-engraving in the reproduction of tone, and therefore to this reproduction the wood-engraver has devoted all his attention and skill, with the result that he has made wood-engraving not only a distinct but an entirely new art. Compare a woodcut after Dürer with one of Cole's engravings of an old Italian fresco or mosaic, and the truth of this assertion must be at once seen. And what is the chief merit of the engraver in this new branch of his art? The very same subjection to the artist which is applauded as such a virtue in his predecessors of the fifteenth and sixteenth centuries. In the drawings he seeks to reproduce there are no lines; consequently he avoids all aggressive effect of line in his engraving. It is as unfair to take a small bit of one of his engravings and enlarge it on the screen, and then compare it to an entire engraving in line, as Mr. Linton delights in doing, as it would be to compare an enlarged corner of an oil painting to an en-

larged etching, and then find fault with the painting because in it was shown no true feeling for line.

No sooner had Mr. Linton finished pointing out the rightness of old engraving and of his own, and the wrongness of American engraving, than Mr. Crane undertook to prove that truth about book-illustration and decoration which he had already declared in the Arts and Crafts Exhibition. His subject was, of course, far wider than Mr. Linton's; but, interesting as is the history of illustration, beginning as it does with picture-writing and hieroglyphs, I have only space here to dwell upon a few of the more prominent features of its development which bear specially upon Mr. Crane's conclusions in regard to modern illustration. For all practical purposes it is sufficient to study this development in Christian Europe, where it is necessarily divided into two great periods, the MSS. period and the period of printed books. There are examples of a stage of transition between the two. In the very early days of printing, the printed text was sometimes decorated by hand with a beautifully illuminated initial letter or margin. But soon the decoration, as well as the text, was printed, and old methods were entirely done away with. But in the artistic treatment of the page there was little difference. The MSS. had been rich with ornament, sometimes confined to a very elaborate initial letter, sometimes extending down the margins, and they had also contained many little pictures meant to illustrate the text, but often so interwoven with the ornament as to be almost inseparable from it. And so it was with the printed books. At times the text was enclosed in a border of graceful spirals or purely decorative forms; at times it enclosed a picture; often picture and ornament, as in the MSS., were not to be separated. In a word, there seemed two distinct ways in which the illuminator or the draughtsman could treat his page. He could ornament it without his ornament throwing the least light upon the meaning of the text, or he could decorate it with pictures which were primarily illustrative and intended to enforce its meaning; perhaps it may be said he found a third way of treating it in a compromise by which he joined together his purely decorative and his illustrative ornaments. In view of this fact, which no one with the least knowledge of MSS. and early printed books can deny, Mr. Crane insists upon a distinction between the decoration and the illustration of books, though both, he teaches, are legitimate. While this is in a measure true, it is not wholly so; for if often book-decoration is not illustration, book-illustration is always decoration—that is, of course, provided it is good of its kind. The distinction really is between the drawing which is conventional or geometrical in form and treatment, and the drawing which seeks to give a realistic rendering of its subject. However, for the sake of argument, let the former be called decoration and the latter illustration.

Like Mr. Linton, Mr. Crane sees only good in the work that was done until the end of the sixteenth century. He also finds much to commend in English decoration and illustration towards the end of the last and the beginning of this century as represented in the drawings of Blake and Stothard and Bewick, while he approves of the pre-Raphaelites as illustrators. But when he comes down to our own day, again, like Mr. Linton, he can see only evil, and for the present perversion of decorative and illustrative art he too casts the blame upon an American new departure. One might have thought he had never heard the name of Menzel, had he not given it a passing mention in the course of his lectures. That he does know it, and yet is ignorant of the fact that it is Menzel who is really responsible for almost all modern illustration, seems almost incredible. American illustrators themselves would be the first to admit the debt they owe, not only to the German master, but to Fortuny, Rico, and Vierge, to whose work and influence Mr. Crane did not even refer. The very pre-Raphaelites who meet with his approval were indebted not a little to Menzel, whose drawings were better known among English artists in their day than in ours.

But whoever is responsible for this "new departure," the important question, as in Mr. Linton's case, is, What is the objection to it? and before this can be satisfactorily explained, it is well to consider for a minute the chief differences between the old and perfect—according to Mr. Crane—illustration and decoration, and the modern, which is held to be so vitally at fault. These are, first, the greater command of technique of the modern draughtsman, and secondly, and even more important, the enormous development in mechanical methods of reproduction and printing. In illustration as in painting, it will be found that, as the artist's technical resources were perfected, his rendering of his subjects became more realistic; the difference between Menzel and Dürer is due to the same cause as the difference between Fortuny and Giotto. Often what seems to us decorative in the painting and illustration of the past is nothing more than the result of technical limitations. Again, the illustrator of the sixteenth century had to adapt his drawings to the woodcutter's power of cutting them on the block. That he was much less free in his illustration than in his other work, is seen at once by comparing Dürer's etchings, like the "Big Horse" and the "Melancholia," with his woodcuts, like those of the "Kleine Passion." As Mr. Crane says, the mechanical relation of the work of draughtsman, engraver, and printer really gives the key to all good design. In the sixteenth century the power of engraver and printer was limited; therefore, when the mechanical relations were right and the design was good, the power of the draughtsman was limited as well.

To-day, with the development in mechanical resources, the draughtsman gains in freedom. He can draw in wash an elaborate landscape, or make a no less elaborate figure study, and, reproduced on the pages of a magazine, the mechanical relation of his work to that of engraver and printer is not violated. With this greater freedom he does what would have simply been an impossibility in Dürer's day; but this does not necessarily imply that what he does is wrong. It can easily be understood that, with his own constantly increasing command of technique and the ease with which his drawings can be reproduced, he has given more and more of his attention to illustration, and less and less to decoration, using the words in the sense attached to them by Mr. Crane. But surely this cannot be the great fault in modern work. Mr. Crane, when dealing with the sixteenth century, found as much to praise in illustration as in decoration, holding up as models drawings of Dürer and Holbein which had absolutely no decorative relation to the page on which they were printed. Nor can it be in the greater elaboration of modern drawing; it is not thought a fault in Dürer that his drawings were far more elaborate than the St. Christopher of the earlier artist. Why then is American work, which, with Mr. Crane, seems to mean all modern work but his own and that of his followers, so debased a form of illustrative art?

When it comes to giving his reasons for his wholesale condemnation of American magazines, it seems his quarrel is really with a very small portion of the work published in them. His argument really is this: American illustrative work is bad, because here and there the magazines publish decorative drawings which, as decorations of the page, are bad. That their decoration sometimes is not good is true enough, but is it sufficient reason to condemn all the work of the American illustrator? And how does Mr. Crane prove his case? By keeping a discreet silence about the drawings of Americans, like Mr. Howard Pyle, who work according to the methods he advocates, and by holding up to ridicule one page from the *Century* with a decoration of flowers in which the text, as he put it, torn into an irregularly ragged edge, seems instinctively to shrink from touching the illustration, squeezing itself together, as the passengers in a crowded omnibus might do, reluctantly, to admit a chimney-sweep. The page is not especially beautiful, but when it comes to Mr. Crane's own pages with the text written by him, we find often the same ragged effect in it. American magazines might unquestionably be improved if greater attention was given to the decoration of their pages; but it must be remembered that the most beautiful and richly decorated books in the past were made solely for the rich; the magazines are for the people. This of course would be no reason for the dissemination of bad art, but that the art is bad not even Mr. Crane would assert; for (a proof of the weakness of his case) when it came to showing the best examples of contemporary illustration, he was obliged to borrow from these very magazines and from Americans. He showed the work of one or two other Englishmen as well as many drawings of his own, but even greater prominence was given to the work of Mr. Vedder, Mr. Abbey, Mr. Parsons, and Mr. Pennell, though I noticed he neglected to mention the fact that three of these artists are Americans, and all are contributors to American magazines, so that, to his audience at least, his argument was not weakened. It is strange that in the one newspaper report of his lectures I have seen, while his abuse of the *Century* and *Harper's* was carefully recorded, his exhibition of American work was as carefully ignored.

Thus it will be seen that in this loud outcry against American illustration, the criticism, when analyzed, amounts to this: American engravers are taken to task for qualities found admirable in engravers of the sixteenth century; American illustration is ruthlessly condemned because occasional magazine pages are faulty according to conventional standards. It would be no less folly to praise our illustrators without qualification than it is to blame them without reserve. Many would doubtless profit by a careful study of book-decoration in the past. But at the same time, just now that in England the effort is being made to put all American magazines under the ban, it is only right to show the fallacy of the arguments used against them.

PREHISTORIC SICILY.

CATANIA, February 27, 1889.

IT seems to me that there is more to be learned of the earliest civilization of Europe from Sicily than from any other European land. Its extreme fertility, and its position in the great currents of migration and commerce from the earliest traditions, at once favored agriculture, which is the basis of civilization, and colonization and commerce, which sustain and stimulate it. Diodorus Siculus tells us that

the antique tradition was that wheat had its origin in Sicily, and that even in his day it was to be found wild in the fields of Leontini and in other parts of the island; and the interpretation of the myth of the rape of Proserpine long ago offered by the myth interpreters is, that the corn when planted was supposed to be with Dis, and when in bearing to be restored to the light of day for that part of the year which Proserpine passed with her mother, thus dividing the time of its existence between the infernal and supernal deities. Certainly the plant has never been found growing wild in any other country, and if not now in Sicily, there is no cause for wonder, for no land has seen its domestication so completely carried out. And in the mythology of the Greeks, who never pretended to be the earliest colonizers of the island, the original home of Ceres, the goddess of the wheat field, was always allowed to be Trinacria, the Greek name of the island, and Proserpine was said to have been born there. Ceres was the peculiar Sicilian deity, and Diodorus, in his simple pagan credence, says: "And that the rape of Proserpine did take place here is clearly shown by the observation that there is no record that those goddesses had ever lived anywhere else than in this island, loved by them far above any other place. And that rape took place in the fields near to Enna, a locality not far from the city, laughing with violets and other species of most beautiful flowers, and in every way worthy of being admired. And so strong here, it is said, is the fragrance of the odors [of the flowers] that the dogs on the track of the game cannot find the scent for the overpowering force that the perfume of those fields has on their organs."

Be it coincidence or confirmation, it does so happen that the earliest indication of a settled and determinate order of social existence that we find in Europe is here to be found. The tombs of the great plains to the west of Palermo are at once indications of social organization and that reverence for the dead which must be taken as a sure sign of some religious culture—of the former through the aggregation of the sepulchres in so great a number and in so close propinquity, and of the latter in the care for the security of the remains and the provision for the use of the departed in the other existence, and the curious decoration of the bones after the flesh had been stripped from them. The graves belong to the type of "well-tombs," and show a curious and subtle art in their design for the purposes of concealment, though by their technique they are widely separated from the "well-tombs" which are the earliest we know of in Italy, as well as by their contents, no metal being found in them; and though it is impossible to come to any comparison of dates, we have a right to consider them earlier than the *terramares* of Italy by virtue of that fact.

But as, at the time when a tolerably authentic tradition of Sicilian affairs comes to us, the island was divided between two races, the Sicani and the Siculi, the latter being recognized as invaders from Italy and belligerent to a high degree, according to Diodorus, and the boundary being recognized by mutual accord at the Himera—the Sicani occupying the western and the Siculi the eastern half—we can safely conclude that these cemeteries are those of the former. Of these Diodorus says, referring to the traditions still extant in his day:

"The Sicani once lived in villages, and had made for themselves on the hills little cities to protect themselves from the attacks of thieves. They were never under the rule of a single king, but each village had its own particular prince. And first they held the whole island, and obtained their living by cultivating the earth. Then, as it happened that in many parts Ætna scattered its flames and for great distances covered much land by its eruptions and devastated the earth for many years, the inhabitants, conquered by fear, abandoned the eastern parts of Sicily and retired into the western. After many ages the nation of the Siculi passed with all their families from Italy into Sicily, occupied the sections that had been abandoned by the Sicani"—

and finally, as he describes, came to terms with the previous inhabitants.

This was the nation which the Greeks, who came in the eighth century B. C., found in Syracuse and Agrigentum as well as in many sites in the interior, from which they were never dispossessed, but maintained their individuality and civic existence until the conquest by the Romans had unified the populations, who had, as Diodorus says, "learned the language of the Greeks and adopted the same manner of living, having abandoned both the barbaric dialect which they spoke before, and the name which they bore, being thenceforward called Siculi." Of these eastern Siculi, there are many necropolises in the vicinity of Syracuse which furnish the evidence of a step forward in the progress of civilization, being excavated in a rock that seems to have been impracticable to the Sicani. From such examination as I was able to make of the tombs, I believe that they must have employed bronze hammers. They have the same form of mortuary chamber as the graves in the western necropolises, which is an indication that the Sicani were a kindred people to the Siculi, as this form is peculiar and (so far as I know) does not appear elsewhere than here, and in parts of southern Italy in which tradition has established the Siculi also. It is a low, oven-shaped chamber, generally about four to five feet across and three high, forming a flattened dome; and it was closed by a slab of stone fitted to the opening, which was only large enough to admit the shoulders of a man of ordinary size, so that the cutting must have presented great difficulties. In the western graves this opening is out of a well sunk in the soft tufa or calcareous limestone, sometimes two or three being cut from one well; while in the eastern the cutting is in the face of a ledge of rock—a harder but by no means difficult stone to excavate, and not, indeed, impossible to be worked by stone tools, as the western clearly were, for they have been found in the graves.

With these differences the two systems of burial appear to have been the same. But while it is clear that the flesh had been stripped from the bones in the western graves, we have no evidence as to this practice in the eastern, for the scientific excavators have not yet succeeded in finding an authentic grave of the Sicilian period intact, their position in the face of a ledge of rock exposing them to view as soon as the earth was washed away, which has in most localities taken place long ago, and leading to their pillage by the peasants, who are always on the lookout for the treasures supposed to be buried in ancient tombs; so that, though the authorities of the museum at Syracuse have been able to obtain a considerable collection of the objects from Sicilian graves, they have never been able to induce the finders to show them the graves the objects were found in. These objects consist of vases of well-burned terracotta, generally hand-made, but in some cases made on a wheel; but as the Sicilian period runs into the Greek, and these tombs are in some cases possibly of the latter epoch, we cannot divide the arts of one from the other with rigid distinctions. The pottery has, however, its own character, and the vases in the museum are always of a primitive type, with decoration, where decoration is, of the simplest geometrical character and in no case of natural forms. They have nothing in common with the decoration of the so-called "Mycenean" or "Corinthian" vases, and in some cases the hand-made vessels are of an admirable make, such as I have not seen in any ancient production of the same stage of art. There occurs, however, the difficulty which must always be encountered in comparative archæology, that the contemporary productions of two countries may be of greatly different stages of progress, and, as we know, the age of stone in one country may coexist with the age of steel in another. Moreover, in the judgment to be pronounced on the Sicilian objects we have also the consideration that the Greeks broke into the civilization of the Siculi in the eighth century, and in all probability the Pelasgi still earlier (if, indeed, the second were not a branch of the last); and it is not impossible that the tombs which have rendered some of our objects were made in the early Greek period; so that any judgment in the matter must be taken with the benefit of an inventory not now possible to draw up.

But this interesting result is sure, that we find in the Sicilian system tombs excavated in the solid, if not very obdurate, rock by a people who did not possess the art of making edged tools to do this work, and whose ceramic products are of a totally different type from the earliest Greek or so-called Phœnician. Together with these in the tombs we find a few bronze articles such as have been found in Italic tombs, viz., the "spiral fibulæ," a type of that article different from any found in Hellenic or Roman tombs; and no articles in common with either of those. In those cemeteries in the immediate vicinity of Syracuse, and which we may suppose to have belonged to the inhabitants expelled on the arrival of the Greeks, as we know that they were expelled, the manner of working the stone is most distinctly to be seen as hammering, similar to the Pelasgic work: and the form of the tomb is so closely allied to that of the tombs of the Sicanian period as to indicate the common origin of the two races—*i. e.*, that Sicani and Siculi alike were immigrations from Italy at widely separated epochs. But we have further confirmation of this provenance in the recorded existence in Italy of lingering remnants of the Siculi, and the occasional occurrence of tombs of their type, showing that they had learned the art of working hard stone in the interval between the two emigrations. But another allied fact, learned from the excavations in Italy, is, that a system of well-tombs obtained in Italy prior to the advent of the Etruscans according to one theory, and in their earliest development, according to an alternative (the former being that of Gamurrini and the Italian archæologists generally, and the latter that of Helbig)—in either case to be put at not later than 900 B. C.—in which we have the use of metallic chisels clearly and indisputably indicated, and the presence of bronze work of Oriental provenance, as in the well-tombs in the museums of Corneto and in the new "Papa Giulio" (Falerian) just inaugurated at Rome, as well as in the *trouvaille* of Vetulonia in the museum of Florence and that of Sybaris. It seems safe to draw the conclusion that the race of the Siculi and Sicani was probably that supposed to be indigenous in Italy, and which was driven down and out of the peninsula according to the traditions, of which one is given by Homer in the account of the origin of the Phæacians.

There is a great difficulty in arriving at more definite conclusions on these points from the fact that, so far, the explorers in the Sicu-

lian cemeteries have not been able to find a tomb intact, the diligence of the treasure-hunting peasants and the stupid obduracy of the proprietors of the ancient sites combining to prevent intelligent and scientific examination of the localities which have those cemeteries still possibly hidden, for many of the Siculian cities are now sites as deserted as the most ancient in the Old World. At any rate, we have in Sicily two stages of development, as marked by their inhumations, prior to anything we find in Italy proper. Professor Orsi, the young and enthusiastic coadjutor of Halbherr in the researches in Crete, and who is the inspector of antiquities in Syracuse, has taken up the subject of Siculian antiquities in his region, while Salinas, the head of the archæological department at Palermo, has given his attention to those of the Sicanian remains; and time and the patience which is so imperative a qualification in such researches will one day give us the complete solution of the problems to be solved. There is one tradition which may be taken for what it is worth in comparative chronology bearing on the antiquity of the Siculian settlement of Sicily. This is the story of the invasion of Sicily by Minos in his pursuit of Dædalus as it is recorded by Diodorus, in whose account Minos is received by the King of Akragas, which was then a Siculian city, and one of those which were on the western limit of the territory assigned by the treaty with the Sicani to the later comers. But as Minos was contemporary with the earliest Greek civilization, we can, from the point of view of mythology, form a conjecture as to the state of the island in the prehistoric epoch of Theseus and Minos. Correspondence.

PROHIBITION IN IOWA.

To the Editor of The Nation:

Sir: To a looker-on in Vienna, the whole question of prohibition seems one easily met and readily answered. It becomes, therefore, a matter of interest to discover why prohibitory laws are not enforced in the same manner that laws affecting persons or property are. It cannot be that they are worse than laws generally, and that for this reason executives let them alone, for the most arbitrary laws are sustained upon the principle that the way to repeal a bad law is to enforce it.

Two reasons more strongly than any others present themselves why temperance legislation is ineffectual. One is, that legislation favoring prohibition is in advance of public opinion; the second is, that it is mixed with politics. That it is in advance of public opinion is shown by the fact that men call the liquor traffic a business, and class it with other commercial interests, and, while the temperance movement is a great moral movement, temperance legislation is entirely destitute of any moral principle. So far it is a mere tissue of expediencies, varying enormously according to the pressure brought to bear upon the different State and local governments within the limits of whose territory the question has been agitated.

Perhaps the very best test of a prohibition vote possible was given in Iowa in 1884. Containing a million of people, this State has no city with a population of over 40,000, and but one, its capital Des Moines, that can claim within 10,000 of those figures. It is an independent, agricultural State with more available land to the acre than any State in the Union, and claims, besides, as its especial honor, the highest per cent. of education *per capita* of any State in the Union. This is the State that polled a prohibition majority of 31,000. So far, so good; the moral pulse of the people beat responsive to the temperance cause. What follows is a commentary on the slowness with which laws are formed, and demonstrates the seeming impossibility of uniting political and moral ideas. The effect of the prohibitory amendment was immediate. The wholesale dealers grew restless, many removed to the large cities in other States, and the retailers showed every disposition to close. In the city of Keokuk, in southeastern Iowa, on the morning of July 4, 1885, the saloon-keepers closed their doors, making no resistance to the law. But mark the conduct of the city fathers when called upon to decide the closing as final. They argued that the city needed revenue, and that the saloons should be licensed. One by one these reopened, paid the license levied by the Council, and continued open until May, 1888, when the Mayor, Mr. John N. Irwin, himself not a Prohibitionist, decided to enforce the law. There is not to-day a saloon open in the city, though liquor in the shape of original packages and in club-rooms is before the people.

In Sioux City the *business men* made a proposition that the saloons be permitted to run. Against this proposition the women of Sioux City, six hundred in number, drew up a protest, drawing upon themselves, by so doing, the most scathing criticisms of the press. "They spoke only the spasmodic sentiments of the feminine nature," one of the leading Iowa papers stated, adding "that men have business experience, and see a certain amount of capital and business going, and nothing to take its place," etc. And again, the Iowa Republican party, in a late platform, did not hesitate to disclaim connection with the temperance party, and to censure the action of the Democratic party in declaring for a $250 license, "compulsory on every community, regardless of local opinion."

These temporizing political conditions are the key to the whole situation; and, until the people decide to enforce the law and compel the assent of voters to law rather than to party, a better state of things cannot be hoped for.

E. B.

Keokuk, March 31, 1889.

On Monday, April 1, an election will be held in this city for Mayor and Marshal. The issue is the enforcement of the law. The Democratic candidate refuses to say that he will enforce the law, while the candidate on the same ticket for Marshal is a saloon man.

[The Democrats carried the day, defeating Mr. Irwin, who sought a reëlection.—Ed. Nation.]

THE IOWA COW.

To the Editor of The Nation:

Sir: An article in the March number of the *North American Review* from the pen of Dr. George B. Loring, on "Does American Farming Pay?" has not, as yet, received the attention it merits, both from the facts it presents and from the authoritative character of the writer, an ex-Commissioner of Agriculture, and now Minister to Portugal.

The paper was prepared, as Dr. Loring himself gave notice to the New England Agricultural Society, in response to ex-Secretary McCulloch's article in the October *Scribner* on the unprofitableness of American farming, and therefore may be regarded as the matured results of the ex-Commissioner's careful deliberation. It appeared at a time when the author was a prominent candidate for the Secretaryship of Agriculture. Whether it came under the eye of President Harrison or not, one cannot definitely say; but as the President says his entire time has been taken up in the "classification and arrangement of applications for office," it is possible that Dr. Loring's paper may have been arranged and classified with the rest. At any rate, as Dr. Loring was sent to Portugal instead of into the Cabinet as the representative of agriculture, it is perhaps safe to infer that the President not only saw the article, but read and inwardly digested it.

On page 366 of the March number of the *North American Review*, Dr. Loring writes as follows:

"When the wheat crop of Iowa failed, the farmers turned their attention to the dairy. They improved their cows largely, by careful breeding and judicious feeding. On the 1st of January, 1887, they had 1,243,000 cows, valued at $32,541,792, and they produced butter and cheese to the amount of $277,477,429, milk, sold and condensed, amounting to $200,000,000, and skimmed milk to $50,417,054. The pasturage of the State is most luxuriant, and the valuation of the live stock is $180,110,016."

By the simple process of division, we find from Dr. Loring's statement, disregarding fractions, that the average Iowa cow, valued at $26, produces annually butter and cheese to the amount of $223, and "milk sold and condensed" to the amount of $160. Besides this, the grateful Iowa cow of average grade returns to her lucky owner skimmed milk to the value of $40, a sum which the average New York cow fails to return as the resultant of her entire yield in dairy produce. Hence we see that the average Iowa cow, $26 in value, yields in butter, cheese, milk, and skimmed milk to the amount of $423 annually, a little over 1,600 per cent. of her value. It is hardly necessary to repeat Dr. Loring's conclusion that farming in America, particularly in Iowa, *does* pay.

In presence of such an achievement as this of the Iowa cow, one can only mention apologetically, even by way of comparison, the results from the New York milch cow of average grade, which, with the comparatively high value of $30.50 (Report of Department of Agriculture, 1887, p. 567), only gives, according to the Report of the State Dairy Commissioner, an annual return in dairy products of $25.79—a sum, as has been previously remarked, far below the yield of the Iowa cow in skimmed milk alone. After giving the figures quoted in the paragraph above, it is surely a work of supererogation for Dr. Loring to go on to sketch some of the visible results of farming in Iowa—dairy farming particularly. It does not, for example, seem necessary to state (p. 366), "The farms of the State are in good condition. The taxes are readily paid." It is obvious that the proceeds from skimmed milk of one genuine Iowa cow would keep in good condition all the fences of a moderate-sized farm and pay all the taxes. What need is there of saying, "An air of substantial thrift pervades the State," when the most casual consideration shows that, disregarding the return from skimmed milk, a decent Iowa cow would yield in one year enough butter, cheese, and milk to pay for and keep a carriage and span of horses? Still more unnecessary is it for Dr. Loring to assert, "It is easy to see that a widespread prosperity pervades the community whose characteristics are the repose and self-possession which attend success." Any farmer who receives an annual income of $8,460 from a herd of 20 cows, worth $522, has achieved a success of which repose and self-possession are but feeble

indications. But as Dr. Loring says, perhaps by way of explanation, "The pasturage of the State is most luxuriant."

One can almost picture our new Minister to Portugal wandering through vineyards and plantations, and discussing, with the Portuguese Minister of Agriculture, matters of bucolic lore. How deeply impressed will the latter be with the results of American dairying when he comes to calculate from the data furnished by Dr. Loring, less in the rôle of Minister Plenipotentiary than of ex-Commissioner of Agriculture Extraordinary, that the American cow of the Iowan variety gives, on an average, each day at least seventy quarts of milk.

FRANK ANGELL.

GENEVA, N. Y., April 4, 1889.

CUSTOM VS. CONSTITUTIONS.

TO THE EDITOR OF THE NATION:

SIR: A correspondent, in a recent number of the *Nation*, takes issue with Mr. Bryce in regard to the alleged omnipotence of a State Legislature except as specifically restrained by the written Constitutions of the State and the nation. What your correspondent has to say upon that subject is not only peculiarly apt, but also highly important, in view of the prevalent notion that the fabric of our State governments rests solely upon written Constitutions. It is rare, indeed, to see public officers charged with the making, adjudicating, or enforcing of the laws, appeal, in matters involving constitutional questions, from the letter of the fundamental law to the spirit of immemorial usage which animates it. Such a slavish regard for the written word in which the founders of the States have endeavored to embody the spirit of Anglo-Saxon government, and especially of American government, and such a careless disregard for the numberless usages and customs which no Constitution can ever hope to formulate, bear their fruit in the not unnatural conclusion to which even so close an observer and so careful a scholar as Mr. Bryce has been led. It is time that public attention be directed less to written Constitutions, and more to the customs and principles on which they rest and from which they derive their strength.

One of the most valuable contributions that have been made to this end is to be found in an opinion delivered by Judge Cooley in the case of the People vs. Hurlbut (24 Mich., 44). In this case the Legislature of Michigan undertook to appoint the members of a Board of Public Works for the city of Detroit. The appointment was resisted on the ground of its unconstitutionality. Judge Cooley in his opinion makes use of the following language:

"We must assume [from a written Constitution] either an intention that the legislative control should be constant and absolute, or, on the other hand, that there are certain fundamental principles in our general framework of government which are within the contemplation of the people when they agree upon the written charter subject to which the delegations of authority to the several departments of government have been made. That the last is the case appears to me too plain for serious controversy. The implied restrictions upon the power of the Legislature, as regards local government, though their limits may not be so plainly defined as express provisions might make them, are nevertheless equally imperative in character; and whenever we find ourselves clearly within them, we have no alternative but to bow to their authority. The Constitution has been framed with these restrictions in view, and we should fall into the grossest absurdities if we undertook to construe that instrument on a critical examination of the terms employed, while shutting our eyes to all other considerations."

And, after a careful survey of the historical development of local self-government and its relations, historically and politically, to the State, he continues:

"Some things are too plain to be written. If this charter of State government which we call a Constitution were all there was of constitutional command; if the usages, the customs, the maxims that have sprung from the habits of life, modes of thought, methods of trying facts by the neighborhood, the precepts which have come from the revolutions which overturned tyrannies— . . . if a recognition of all these were to be stricken from the body of our constitutional law, a lifeless skeleton might remain, but the living spirit, that which gives it force and attraction, which makes it valuable and draws to it the affections of the people, that which distinguishes it from the numberless Constitutions, so called, which, in Europe, have been set up and thrown down within the last hundred years— . . . this living and breathing spirit, which supplies the interpretation of the words of the written charter, would be utterly lost and gone."

These words of perhaps the greatest living American jurist ought to be carefully weighed by all those who, like Mr. Bryce, are likely to fall into the error of supposing a State Legislature to be, save as restrained by written Constitutions, as omnipotent as the English Parliament. Our courts are the real guardians of our liberties, and, so long as they maintain their purity, will enforce not only the guarantees of written charters, but also the unwritten principles of constitutional government.

E. W. H.

MINNEAPOLIS, MINN., April 3, 1889.

REGULATION OF THE FRANCHISE.

TO THE EDITOR OF THE NATION:

SIR: A correspondent in your issue of March 28 thinks it strange that the Democratic party of North Carolina have passed no act properly regulating the exercise of the elective franchise. In those communities which have a large negro population, it is very difficult to prevent improper votes from being cast, because the majority of negroes applying to vote are wholly unknown to the judges of election. Any one who has observed an election in one of the "black" districts must have been struck with this fact.

Perhaps an explanation of the failure of the Legislature of North Carolina to pass any legislation upon this subject may be deduced from the fact that there is a large portion of the State which does not suffer from the evils mentioned. In western North Carolina only a small portion of the population is composed of negroes. The western part of the State would naturally not sympathize with the efforts of the eastern counties to regulate the franchise, and would be unwilling to put themselves to any inconvenience to benefit others.

A bill was introduced in the Legislature of this State recently, which adopted the main features of the Australian system as far as the secret ballot is concerned. It further provided that where a voter was not known to the judges of election to be qualified to vote, he should prove that fact by the testimony of two citizens of the voting precinct known to the judges. Otherwise, he could not vote unless he produced a poll-tax receipt for the fiscal year preceding the election.

The bill was defeated by the votes of the Republicans in the House of Representatives, largely aided by the votes of northwest Arkansas, the strongest Democratic stronghold of the State. The reason of their opposition is perhaps best stated in the language of their leader in a speech closing the debate:

"You may be able to make your 'nigger' toe a mark thirty feet away from the ballot-box, but I want to tell you now that the white people of the north part of this State will be slow to comply. They are a law-abiding people, and if this bill should become a law I hope they will obey until we can repeal it; but I must confess I have some doubt as to whether you can, even by law, force a proud American citizen who has lived in the mountains of Arkansas for years, and breathed its pure air and drank from its pure, sparkling streams, to toe a mark and put his hat under his arm and take out his poll-tax receipt in one hand and his ballot in the other, and walk up and ask if his name is registered."

It would be interesting to know whether a similar reason is not at the bottom of the failure of the Legislature of North Carolina to enact some law upon the subject.

Very respectfully, T. D. CRAWFORD.

LITTLE ROCK, April 1, 1889.

COLLEGE INSTRUCTION BY LECTURE.

TO THE EDITOR OF THE NATION:

SIR: While "A. G. G." (in No. 1239) is treating of the abuse of the college examination and the remedy therefor, I wish to enter a protest, if space be allowed me, against a custom quite as widespread and almost equally pernicious. In the letter referred to are these sentences:

"In ethics the subject is first treated in a series of thirty-four lectures, of one hour each. Each student is required to take notes on these lectures, and he is encouraged to make them as full and accurate as he can. After the lecture, he rewrites and improves his notes."

It is to direct attention to this custom of attempting to impart information by lectures that I write.

A seemingly sufficient objection is, that it is prodigally wasteful of time. The hour that the professor occupies in reading his lecture, the student spends in the mechanical labor of writing down the spoken words. Then he is supposed to spend (and he must if he "improves" any) another hour in reducing the hastily scrawled and all but illegible notes to a plainer and more enduring form. The first hour the student has performed the work of a stenographer, the second that of a bookkeeper, with the skill of neither. Whatever its object may be, its practical result is the getting the ideas of the professor before him in an accurate and available form. Having accomplished so much, he can proceed to study and reflect upon the more abstruse points of the address, and perhaps read a few references. Judging from my own experience, this time is worse than wasted: it has imposed needless and irksome work entirely foreign to the purpose of lecture-giving. One half-hour of study with the professor's lecture before him in printed form would accomplish more for the student than the two hours of scribbling.

A second objection is the inaccuracy that results. "A. G. G." says the student "is encouraged to make them *as full and accurate as he can!*" My dear sirs, professors all, who read the *Nation*, and, mayhap, are accustomed to lecture yourselves, is it not your business to see to it that every student who comes under your care shall have the matter you wish him to understand placed before him with absolute and entire accuracy? Instead of that, you puzzle, annoy, and set down as a stupid many a young fellow, because, indeed, he has not facility in transcribing and reproducing the ideas you have so admirably presented.

I have a trunk full of note-books—and I confess that many of my lectures, for lack of time, were never rewritten—containing what I could catch of ethics, æsthetics, philosophy, political economy. Instead of being well-nigh invaluable as containing the elements of the subjects treated, they are well-nigh worthless. Fully one-third was never set down, one-third is illegible, and the remaining portion is too incom-

plete to be of service. These lectures represent several years of "education." Printed, they would be an enduring and helpful presence; as it is, they are a brilliant memory.

The custom is old; it is not merely a mediæval one — it belongs with hieroglyphics, cuneiform inscriptions, and peripatetics. It is out of place in the age of the printing-press and the manifolding typewriter. It ought to go.—Very respectfully, THEODORE JESSUP.

BALDWIN, WIS., April 2, 1889.

COLLEGE EXAMINATIONS.

TO THE EDITOR OF THE NATION:

SIR: The best method of conducting college examinations will doubtless be an unsettled question for some time to come, but the speediest way of arriving at a comparative solution is by an interchange of ideas and by a comparison of the results of experiments.

Your correspondent in the *Nation* of March 28 very naturally found an oral examination "little better than a farce" when only a few minutes were devoted to each pupil. But, without question, an oral examination has some advantages peculiarly its own, and the advantages of an oral examination properly conducted should not be underestimated. I quote from a letter of Dr. Arnold, dated March 17, 1838, to the Chancellor of the University of London, on the subject of vivâ-voce examinations:

"First. The exercise of extempore translation . . . is an exercise of exceeding value; . . . and if men are tried by written papers only, one great and most valuable talent, that of readiness, and the very useful habit of retaining presence of mind, so as to be able to avail one's self without nervousness of all one's knowledge, and to express it by word of mouth, are never tried at all. Second. Nothing can equal a vivâ-voce examination for trying a candidate's knowledge in the contents of a long history or philosophical treatise; . . . for a man's answers suggest continually further questions; you can at once probe his weak points; and, where you find him strong, you can give him an opportunity of doing himself justice, by bringing him out especially on those very points."

The first objection urged against a written examination at the end of the term is, that "preparation for it led (almost necessarily) to cramming," but this objection can be urged with almost equal force against any kind of examination, and the only remedy for this widespread evil, so far as I can see, is to free the pupil from a tendency to it by insisting upon thorough daily labor. If written examinations foster "the vice of cheating," and if students "make and carry in notes concealed from the professor by every conceivable artifice," and "tear up text-books and conceal the fragments about the person in many ways," then there is evidently something wrong in the moral tone of the institution, and the remedy is to be sought deeper than in the form of the examination. If the honor of a student cannot be relied upon, we had better adopt at once the Chinese plan.

In all the colleges of which I have any knowledge (they are Southern ones), the only restraint placed upon the student is the reliance on his honor, and dishonesty is rare in the extreme; but, if there should be an offence of this kind, the sentiment of the body of students compels the offender to leave immediately. These written examinations are very valuable to the student, for they enable him to summarize his work for the term and to gain a comprehensive view of the scope of his work.

The system proposed, which is described as a "method of detailed written reviews," is, to my mind, a very imperfect one, although it has many excellent features. Used alone, I note the following objection to it: it facilitates "cramming," for it is easier to reproduce thirty pages by a temporary stress of memory than three hundred; even a good student, having a fair knowledge of a subject in its parts, may fail to comprehend it as a whole.

Some experience has shown me that to give students a chance of doing full justice to themselves, and, at the same time, to benefit them most, a combination of these methods is necessary, and the following is a brief outline of the method I am accustomed to pursue. At the close of every five weeks, reviews of the text studied in that time are held; these reviews are sometimes written, but generally oral, and occupy only the usual recitation hour. Then a written examination of half a day is given at the end of each term. After these have been graded and averaged, from twenty to thirty per cent. of the whole examination is allowed as a maximum for the *daily average* in recitations. The combination of the class standing and the review examinations with the semi-annual ones does a great deal towards getting rid of chance, and at the same time does justice to the whole of the student's knowledge, and is of special benefit to timid students whose presence of mind fails them in the examination room. It is apparent that, by combining these different factors, the merits of one system supplement those of another, and defects are reduced to a minimum.

One of the best ways, both of preparing a student for examination and of shaping and fixing his knowledge in his mind, is to insist upon continual original work in all branches of study, by means of weekly exercises, which are corrected and handed back to him.

As your correspondent said in regard to his system, all this means work, and an enormous amount of work, but the results are so satisfactory that the conscientious teacher is compensated, realizing that there can be no excellence in the pupil without labor on his part.—Very respectfully, GEORGE SHIPLEY.

MIDDLEBURG, VA., April 4, 1889.

THE INTER-STATE COMMERCE AMENDMENT.

TO THE EDITOR OF THE NATION:

SIR: The report of the Inter-State Commission appears to me to present some subjects worthy of notice apart from the results of their action, which I am probably not competent to criticise.

The inherent objection to all commissions of the kind is most obvious, namely, the desire to extend their jurisdiction or power, and the evident desire to interfere with what has been withheld. The notion that they can regulate men's business better than the owners can is quite patent. On page 4 there is asserted a right to inquire into the concerns of every corporation engaged in inter-State commerce, because that information will enable the Commission to deal the more efficiently with the subject committed to them. Why confine this to corporations? If the reason or ground for the claim warrants the arrogation of the power, evidently not a dealer or trader exists whose business arrangements are not liable to be made public at the demand of this Commission. They ask that carriers by water shall be subjected to their control; and look at the consequence: Tramp ships can skin the regular carriers alive, for the essence of the demand is that no carrier shall lower or raise his rates without adequate notice—a fair provision where all are subject to it, but where rivals are not, how absurd! And is it intended to prohibit charters without ten days' notice to the public of the rate? On page 22 the Commission undertake summarily to declare that they, and not the carriers, are the proper persons to name rates on different kinds of goods. Under this system the packets would have been prohibited bringing out Scotch pig as ballast.

In respect to the main assertion, however, the cardinal object of the statute, they have, in my judgment, exhibited a most remarkable want of the judicial faculty. If there be a maxim more valuable than another, it is that phrases which have an ascertained meaning in the courts are presumably used in that sense in subsequent legislation. Now, discrimination between shippers never has been objected to. Nobody ever supposed that an obligation to treat all customers alike prevented discrimination. No one ever supposed that universal laws of trade were to be disregarded. Yet these gentlemen evidently (p. 10) treat as absurd the notion that one who stipulates to furnish a train-load can be dealt with at a lower rate than one who sends a tenth of a car-load. But they seem to ignore the fact that—(1.) The statute does not prohibit discrimination. As I remarked, that would be to disregard the laws of trade and make it illegal to sell by the cargo lower than when selling by the ounce. (2.) That it is *unjust* discrimination at which the act is levelled, and which is made criminal by the amended statute. (3.) That what they denounce on page 10 was decided to be legitimate, under a provision requiring all customers to be put upon an equality, as long ago as 1858. To deny this to the carrier may be right, but one must take care of his words when he does it.

It reminds me of that phrase which always precedes the surrender of the litigant to the caprice of the judge, *sound discretion*. I once knew a court, in the exercise of a sound discretion, sanction the sale by a trustee to himself at a less price than was offered by a stranger; and, strange enough, they would not, though requested, change the term by which they defined the reason for this judgment. But, as I read the act, Congress has not yet determined to set up a commission who shall supplant the managements of all the railroads. They are doubtless bad at times, but a commission would be worse.

If I understand the statute, the power to interfere, being conferred by statute, is limited to the cases defined. A general paternal supervision is not conferred, and never will be while we are a free nation. Better by far assume the business and let the nation be the universal carrier. The statute is aimed at an *unlawful* discrimination of rates (sec. 2 of the amendment) and *undue and unreasonable preference* (sec. 3 of the original); and when the same distinction that prevails in all business between wholesale and retail transactions is declared to be proper when construing an act prohibiting discrimination, can it be possible that the Commission have the right to disregard it in construing the new statute?

For what purpose is the word discrimination qualified by the adjective unjust or unlawful? or advantages qualified by undue and unreasonable? In the same way, the qualification in the long-and-short-haul clause seems to be disregarded.

Doubtless there are cases that seem very hard—possibly they are so; but if it is proposed to treat the fact that the long haul takes an entire train and the short hauls are of fractions of trains between the same termini, as an immaterial difference, it is a mistake. No

one who knows anything of the practical operation of a railroad but must know that it is impossible to carry the short hauls for the same gross sum as the long hauls, for the simple reason that the delays in casting off the cars at each local station cause an expenditure in wages and car hire for the short haul double what they are on the long haul.

If, for instance, it takes fifteen minutes to get the train under way after stopping to deliver the cars for the way station, if the through-train takes ten hours, and there are forty stations for the local train, the latter will require double the time for delivering the same quantity that the through-train requires. Upon the hypothesis, the same quantity of rolling-stock is used and the same wages paid per hour. The receipts being the same, the expenditures are double. Then ask what proportion of the expenses of railway management is attributable to wages and rolling-stock.

It is also stated as a debatable point (p. 10) whether the lowering of rates so that any trade with a particular point is practicable is permissible. If not, there should be a new set of rules framed that will explain how one is to expect to get a dollar for an article in the open market which is offered at fifty cents. This reminds one of fiat money, only it is much more absurd, because it is absolutely impossible even for tyranny to maintain. R. W. M.

PHILADELPHIA, April 8.

THE NORTHWEST RAILWAY SITUATION.

TO THE EDITOR OF THE NATION:

SIR: The *Nation* of March 28 contains an article entitled "The Northwest Railway Situation," beginning as follows: "Under reductions begun by the Chicago, Burlington and Northern Railroad, the old flour and grain rate of 7½ cents per 100 pounds between Minneapolis and Chicago, which was raised to 12½ cents by great efforts last fall, seems likely to be reëstablished." The grain and flour situation is discussed, and some of the questions incidental to it—including milling in transit, the origin of the grain, and the destination of the flour.

In my opinion, the article is wrong in the statement that "the road which brings in the wheat and can carry out the flour feels, rightly and naturally enough, that the flour belongs to it." The railways which bring wheat from the West to Minneapolis, in place of taking it to points on their own lines east of Minneapolis, do so because they cannot help themselves. The milling facilities at Minneapolis attract the grain, and the railroads take it there. When the wheat reaches Minneapolis, it changes ownership, usually once at least, and may change several times. It changes its character as well, and goes out as manufactured product—the flour in one direction and the bran and other low-grade products usually in another.

The questions involved in milling in transit have been gone over so often in the past that perhaps it is not worth while to discuss them now. It is a matter of opinion as to who is right about it, and the "transit" roads and the "non-transit" roads differ in accordance with their several interests. I believe it to be a fact, however, that among railroad-traffic men who have no interest in the question, but who have examined it, the preponderance of opinion agrees with the position taken by our company. This is an opinion about which we have nothing to say; but the article in question contains direct misstatements, of which, perhaps, you would like to be advised. The reductions in question were not made primarily by the Chicago, Burlington and Northern Company. The facts in the case are as follows:

One road took flour from Minneapolis to Lake Superior without fixing any price at all, billing it without freight charges, leaving the same to be determined on the opening of navigation in the spring. Another line, discovering this, reduced the rate from Minneapolis to Lake Superior from 7½ to 5 cents per one hundred pounds. Thereupon a line doing business through Canada reduced the rate from Minneapolis to a point occupying the same relation to that route that Chicago occupies to ours, to 7½ cents per 100 pounds. The latter rate was then met by our company.

The writer of the article in question may not have had opportunity to get at the facts, and therefore unintentionally misstated them.

Canadian lines have been for some time past able to secure freight which they have never been able to take before. The Inter-State Law is the direct cause of the trouble, forcing the business of Minneapolis out of the country by the shortest possible route. A large part of the flour ground at Minneapolis goes to Europe. The transportation lines from Minneapolis to all United States seaports are, of course, subject to the provisions of the Inter-State Law. The direct result is, that business naturally takes the route where it is least obstructed, and therefore goes via Canadian railways to Canadian seaports, instead of via our railways to our seaports.—Yours truly,

GEO. B. HARRIS, Vice-President.

CHICAGO, BURLINGTON AND NORTHERN RAILROAD CO., ST. PAUL, MINN., April 6, 1889.

JOSEPH COOK.

TO THE EDITOR OF THE NATION:

SIR: In my judgment you are decidedly in error in intimating that the power and popularity of Joseph Cook are declining. If the test of power and popularity is the space given to a man in the Boston daily press, then Sullivan is a greater man than Phillips Brooks, A. J. Gordon, or Joseph Cook. As to popularity, it is a wonder that the fearless champion of popular reforms was greeted at his two hundred and tenth lecture, on Monday, March 25, when I was present, by the same matchless audience as to quantity and quality that he used to have when his lectureship was a novelty. I know Boston, and I know that its aggressive leaders were largely represented and profoundly appreciative of the speaker's words that were half-battles. That the lectures are less published than formerly is due to the fact that Mr. Cook prefers to publish them in his own magazine, *Our Day*. His engagements to lecture, at prices like those of Gough and Phillips, five or six times per week from four to six months per year, do not betoken fading popularity.

WILBUR F. CRAFTS.

BOSTON, March 26, 1889.

FAUST AND LESSING.

TO THE EDITOR OF THE NATION:

SIR: Your first impression about Prof. Moritz Carriere's article on the authorship of Goethe's "Faust," attributing it to Lessing, that it was only a "clever (?) bit of persiflage," was, after all, the correct one. Prof. Carriere declared it so under his own signature in a letter which, unfortunately, I have not at hand and can therefore not quote, addressed to the *Revue Politique et Littéraire* (*Revue Bleue*) of Paris, which had fallen into the same mistake as the *Nation*, and for the same reason. Prof. Carriere's case is a little like the boy's who had to write under his drawing, "This is an ox." The learned Professor omitted to write as an epigraph to his paper: "This is a joke."

Yours truly, A. C.

CAMBRIDGE, MASS., April 6, 1889.

Notes.

HARPER & BROTHERS publish this week 'Further Reminiscences,' by W. P. Frith; the third edition, revised to date, of 'A Manual of Historical Literature,' by President Adams of Cornell University; 'The Tramp at Home,' by Lee Meriwether—studies in the condition of the working classes; and 'The Mouse-Trap, and Other Farces,' by W. D. Howells, illustrated by C. S. Reinhart.

Macmillan & Co. announce as the second issue in their dainty "Temple Library" 'The Poems and Plays of Oliver Goldsmith,' edited by Austin Dobson, and illustrated by six etchings; in their new "English Men of Action" series, a 'Life of Livingstone,' by Thomas Hughes; in their new "Library of Philosophy," 'Epistemology, or the Science of Knowledge,' by Dr. James Ward of Trinity College, Cambridge, and a translation of Erdmann's smaller 'History of Philosophy,' in three volumes; and 'The Swiss Confederation,' by Sir Francis Ottiwell Adams and C. D. Cunningham.

'John Charaxes,' a novel imputed to Mr. George Ticknor Curtis, is in the press of J. B. Lippincott Co. It bears upon the question leading up to the civil war.

Cassell & Co. have published a new edition of the 'Life and Times of John Bright,' by William Robertson, which originally stopped at the year 1883. It is now brought down to the present moment, when the great orator and reformer is no more. This work is, in a literary point of view, much inferior to Mr. G. Barnett Smith's memoir (1881), but as it, too, quotes freely from Mr. Bright's speeches, it cannot be thought superfluous for reference on the same shelf with Mr. Smith's. We could say this with greater emphasis if the index were adequate, which it is far from being. The thirty-eighth chapter, for example, is on "The Civil War in America," but no reference to the war, to the cause of it, or even to the United States, is to be found in the index. Mr. Robertson's capacity for historical summaries outside of his own province is shown by his account of the origin of the rebellion: "The quarrel arose through there being a disposition in the North to abolish slavery throughout the Union; and the election of Abraham Lincoln, who was the first anti-slavery President, brought matters to a climax," etc. Not a few admirers of Mr. Bright will wish the last chapter, on his attitude towards Home Rule, had never had to be written.

Houghton, Mifflin & Co. publish a complete edition, in four volumes, of the works of the late Rowland G. Hazard, edited by his granddaughter, Caroline Hazard. It consists of two volumes of miscellaneous essays arranged under a general head, and two distinct philosophic treatises on the Will; and all bound so that each volume can be bought separately. That on Language contains a brief and interesting memoir of the author, but it ought to receive a title which would suggest the nature of its contents more accurately, for it is really a collection of interesting literary, moral, and biographical essays. The philosophic volumes on "Freedom in Willing" have

a double interest in having originated, one of them from a suggestion of Dr. Channing that he refute the arguments of Jonathan Edwards, and the other in a correspondence and controversy with John Stuart Mill, and also in having been the work of a man who was engaged all his life in manufacturing and business. Several essays are published for the first time. The collection on "Politics and Economics" contains several on questions of current public interest, one written in 1864 on the wool tariff, and one in 1885 on the existing tariff in general. One in 1840, after the election of Gen. Harrison, on political morality, outlines the present position of the Independents as to civil-service reform. All show how much a busy man with a sound moral and philosophic judgment may do for literature, benevolence, and good government, the three objects for which Mr. Hazard seemed to live. The paper and print are excellent, and the editing is of the best.

Dr. Georg Steindorf of the Berlin Museum has translated Maspero's 'Egyptian Archæology' into German (Leipzig: Wilhelm Engelmann). The German edition is more convenient than the French original or the English translation by Miss Amelia B. Edwards, as it is provided with an index. Dr. Steindorf has also added some valuable notes.

Cassell & Co. send us their annual 'National Academy Notes,' Mr. Charles M. Kurtz's illustrated catalogue of the exhibition of which we speak in another column.

The February *Portfolio* (Macmillan) has for frontispiece an exceptionally fine photogravure after one of the three Van Eycks in the National Gallery, the turbaned head of an unknown man; W. J. Loftie's papers on Westminster Abbey are continued, with the aid of a variety of illustrations; and others, on the Certosa of Pavia, by Selwyn Brinton, are begun, with two process views of the façade. Dartmoor is the subject of papers in both the February and March numbers, with etchings of scenery and cuts of antiquities.

L'Art for February 1 (Macmillan) offers new documentary evidence concerning the Bellini family of painters, and numerous examples of the art of the late Eugène Lavieille, the landscapist, who died in January last. In the issue for February 15 Troyon is the leading theme, again with much accessory illustration. It is told of this painter that he acquired the masterpieces of contemporary artists, like Delacroix, Rousseau, Millet, Dupré, leaving at his death a very pretty fortune in this collection. He was an indefatigable worker, and of equal modesty and independence.

The *Photographic Times* of this city, for April 5, tells of a prize worth $200 offered by the Executive Committee of the Photographers' Association of America for three plain photographs illustrating Longfellow's "Evangeline."

The veteran philanthropist George Jacob Holyoake has just begun "an occasional magazine advocating the amity of nations," called the *Universal Republic*, and published at 6 Salisbury Court, Fleet Street, London, E. C. He disclaims any thought of profits from the enterprise, and apparently does not contemplate an organized propaganda; nor do we find in the first number any definite statement of means to the desired end, though there is reference here and there to things which make for international peace and good-will. Mr. Holyoake's address is Eastern Lodge, Brighton, England.

The fourth number of the seventh series of the Johns Hopkins University Studies in Historical and Political Science relates to the "Municipal History of New Orleans," the writer being Mr. William W. Howe. The fifth section deals with charitable endowments, and gives, among others, a brief account of the McDonogh fund, with which the city builds its school-houses.

We have received the March Proceedings of the American Society for Psychical Research (Boston: Damrell & Upham), in which the general reader will find most entertainment from studying the report of the Committee on Phantasms and Presentiments, by Prof. Josiah Royce, the appendix of narratives, and Prof. Royce's comment on these. We pick out a practical item from a communication on the general subject by Prof. Coleman Sellers, under date of December 20, 1888, to the effect that "a flash of thought" unconnected with a conscious train of reflection gave him an invention for "racking back" on the Remington type-writer, in a manner corresponding to the advance by means of the spacing-key.

The Proceedings of the American Oriental Society at Philadelphia last autumn have been issued in connection with vol. xiv of the Journal. Vol. xiii, with the Proceedings to May, 1888, is promised shortly.

"The Dimensions of the Babylonian Ark" are discussed in No. 36 of the *American Journal of Philology*, by Paul Haupt, after the cuneiform tablet. He even determines the draught of the vessel, viz., 80 half-cubits; the Babylonian cubit being .5328 metres.

H. Gaidoz, in *Mélusine* for March 5, takes up once more the judgment of Solomon, using as his point of departure an ancient intaglio, apparently of Eastern origin, which represents the disputed infant held like a frog by the King, while the executioner is ready to divide it with his sword, and one of the women is suppliant at Solomon's knees. Solomon, M. de Longpérier has remarked, is slighted by the evangelists, and has rarely been the theme of Oriental Christian art. With the Arabs his vogue was quite different.

We learn that the Greek Government has taken the privilege of excavating Delphi from both French and Americans, and given the concession to the Greek Archæological Society exclusively.

"C. W. G." writes us from Philadelphia: "Apropos of your recent correspondence regarding the word *topsyturvy*, it may not be uninteresting to call your readers' attention to the τρέπουσα τύρβ' ἄνω κάτω of Æschylus. Of course it is only a coincidence of sound and idea alike between the Greek and the English. Not often does our language take up words from another and make a common or vulgar use of them, as the French has done with the *tohubohu* of the Hebrew. Even so plausible a derivation as that of the French *charivari* from the late Greek χαλυβάρια (kettles) is to be received with much caution unless the history of the word can be traced."

The attention of the editor of the *Revue Historique* may be called to the fact that Prof. J. (not "G.," as he has it) B. McMaster did not die upon the completion of the second volume of his 'History,' as is stated by Mr. A. Moireau in the March-April number, page 420.

Prof. O. H. Mitchell, who held the chair of Mathematics at Marietta College, Ohio, died of pneumonia on the 29th of March, at the age of thirty-seven. He was one of the authors of the 'Studies in Logic by Members of the Johns Hopkins University.' His paper on a new method of Symbolic Logic in that volume was a work of great originality, and we venture to predict that it will hereafter be found to be the most valuable contribution that has yet been made to that subject. He also contributed several articles to the *American Journal of Mathematics*.

—The newly-issued Calendar of the University of Michigan indicates an unprecedented attendance of students at that institution. The total registration for the current academic year is 1,882. In view of Governor Luce's recent recommendation of an increased fee for non-residents of the State, it is of some interest to see where these students come from. Of the total number Michigan furnishes 876, or about 46 per cent.; 695 come from other Western States and the Territories; 146 from the Middle States; 45 from the Southern States; 32 from New England, and 88 from various foreign countries. It is in general somewhat difficult to formulate the motives which govern American youth in their choice of a college. Often the son goes where his father went. Again, social or confessional grounds, or the recommendation of a teacher or pastor, becomes the decisive consideration. Much more rarely than trustees and professors like to think, probably, does the choice turn upon a deliberate preference of the youth themselves for particular teachers or particular "facilities." But, in spite of the difficulties besetting the subject, if the question be raised, what it is that draws a thousand students from outside of Michigan to Michigan's University, we should venture to guess that, along with the institution's atmosphere of liberty and the admitted excellence of its "plant," its low fees have a great deal to do with the matter. At present a resident of the State pays in fees for his whole four years' course from $90 to $110; a non-resident from $145 to $165. The administration of the University is historically committed, for reasons that are not far to seek, to this policy of low fees, but the founders of the policy, of course, had in mind primarily the needs of Michigan students. There exists no good reason in logic or in political economy why the people of a State should go out of their way to furnish cheap education to those who are not of the State. On the other hand, it is tolerably certain that any considerable increase in the fees of non-residents—that is, any increase worth talking about from a fiscal point of view—would greatly cut down the attendance of foreign students, and thus not only deprive the establishment of whatever prestige there is in numbers, but perhaps actually reduce the total revenue received. Friends of the present arrangement argue that the foreign students are worth, in a purely pecuniary sense, more than they cost. We do not know whether this somewhat singular problem of State politics, if so it may be called, has come to the front elsewhere than in Michigan or not.

—No period of history is so difficult to study as the most recent, partly from the lack of perspective with which we look at events near to us, partly for the reason that the materials for this study are only by slow degrees gathered, sifted, and assayed. A great deal of the most valuable material, indeed, will not be accessible until another generation. The lack of perspective cannot, of course, be remedied; the defect of materials has been largely supplied by the admirable syllabus of Professors Levermore and Dewey, entitled 'Political History since 1815' (Boston: Schofield). This consists of an introduction and twenty-four lectures, which begin with England and end with Africa, the United States being excluded. Being a "political" history, it takes no account, except incidentally, of other departments of the subject; wars are of course referred to, but even economical and industrial history receives rather scant attention. Perhaps, to have given

these events the space which they required would have unduly swollen the bulk of the book; as it stands, it only professes to take up a limited field, and this it does almost exhaustively. A more serious defect is the absence of a general sketch. It is a series of national histories, but we find no general history of the period, nothing to show the relation of the nations to one another, and the succession of great European controversies. We hope that a future edition will add two or three lectures, to coördinate the information contained in the present work, and present a combined view of the history of mankind during this period. This would be assisted by chronological and genealogical tables, and by an index, which the present volume lacks.

—In the *Nation* of April 28, 1887, we noted the beginning of a series of "Einzelbeiträge zur allgemeinen und vergleichenden Sprachwissenschaft," to be published by W. Friedrich of Leipzig. The third number of the collection, which now lies before us, is a volume of 354 pages by Dr. Kurt Bruchmann of Berlin, and is entitled 'Psychologische Studien zur Sprachgeschichte.' The book bears the motto "Feeling is everything." It is essentially an attempt to throw light upon the parallel development of feeling, thought, and language as mutually affected and determined by one another. Our attention is drawn to the fact that in all languages many phrases and sentences are employed which seem, on the face of them, to have an intellectual basis—that is, to imply thought, conviction, intention—when in reality they do nothing of the kind, but are mere senseless expressions of emotion. To introduce us to his line of thought, Dr. Bruchmann comments upon the sentence, "Go to the devil." He observes that the one who delivers this command does not expect any one to "go" anywhere. Very likely he does not believe that there is any devil. Also, he is fully aware that the person addressed would be quite at a loss, if he wished, to execute the order given. In short, the words of this command are hardly "language" at all, but a mere expression of strong disapproval, a sort of roundabout "ugh." Taking this case as a starting point, the author proceeds to quote from many different literatures a large number of locutions which illustrate this tendency of speech. The second part of the volume is devoted to psychological observations upon the data collected. Its style is somewhat too abstract and metaphysical to be fascinating, and the reader occasionally comes across a very simple and familiar idea couched in verbose and circuitous phraseology. Nevertheless, the work presents an interesting contribution to an important line of linguistic study. It deserves to be generally read by philologists.

—It has been announced that the third and last part of the Norwegian Professor Sophus Bugge's 'Studien über den Ursprung nordischer Götter- und Helden-Sagen' is about to appear. This announcement will be received with the greatest interest by mythologists as well as by the students of Teutonic philology. The first two parts appeared, as will be remembered, in 1881, and caused no little stir in the scientific world, especially in Germany, whose scholars used to consider the Norse mythology as representative of the original Teutonic, and in the Scandinavian myths loved to find manifestations of the pure and unadulterated German spirit. For in this work Mr. Bugge boldly asserted the influence, not only of the Christian religion, but also of the ancient Greek-Roman mythology—through Christian missionaries, be it understood—upon the old Norse myths. At the same time the Scandinavian poets, even if their subjects were partly foreign, treated this borrowed matter in an entirely national manner, so that the Old Norse poems are none the less characteristic manifestations of the Scandinavian genius. In the two parts of this work which have already appeared, Prof. Bugge treats of the Balder myth—the "white god" who has so many traits of character in common with Christ. The late Prof. Müllenhoff of Berlin assaulted Prof. Bugge vehemently in the fifth volume of his 'Deutsche Alterthumskunde.' Nevertheless Bugge, in the last part of his book, which treats of the Scandinavian Freyja, a goddess bearing in many respects a striking resemblance to the Roman Venus, still upholds his theory, and even considers it definitively proved.

THE NEW ENGLISH DICTIONARY.—II.

A New English Dictionary on Historical Principles. Founded mainly on the materials collected by the Philological Society. Edited by James A. H. Murray, with the assistance of many scholars and men of science. Part iv, sec. 1. Bra—Byz, completing vol. i (A and B). Part iv, sec. 2. C—Cass, commencing vol. ii. Oxford: Clarendon Press; New York; Macmillan & Co. 1888.

Let us now turn to another branch of the subject which is of more peculiar interest to us in this country, but which at present seems to be exercising the minds of Englishmen also. The question of Americanisms has recently come to attract attention in a marked degree. This is partly due to the fact that there is supposed to be a great divergence going on between the language of Great Britain and that of the United States. English writers make it of late the subject of constant comment, and American ones, so far now from resenting it, are disposed to plume themselves upon the fact. That differences must arise is inevitable. They will spring up wherever new conditions demand new words or demand the use of old words in new senses. In that respect they will develop themselves as rapidly in Australia as in America. There are, besides, peculiarities of usage belonging to one section of the Anglo-Saxon race which will find no admission, or very late admission, into the other. Actual differences of pronunciation do exist and will continue to exist, and that, too, in cases where it is almost impossible to furnish a reason for the divergence. No satisfactory explanation has yet been given of the almost absolute failure of the misuse of the letter H to reproduce or perpetuate itself upon American soil. It is common in England now; in its origin it goes back to the remotest times; yet for some inexplicable cause the air of this country seems fatal to its survival, though it must often have been imported at different periods. Take an even more striking illustration, because it extends to the educated classes in both countries: if the assertion of Prof. Skeat is to be trusted, it is the exception rather than the rule that the aspirate in words like *which*, *whig*, *why*, is pronounced in Great Britain. In the United States the failure to pronounce the aspirate would be the exception rather than the rule.

Differences therefore exist, and they have of late been made especially prominent by two causes. One of them is the custom of selecting slang or popular phrases from all parts of America, and then composing a piece of some length in which they are all carefully included. This within the past few years has been frequently practised by English writers, sometimes for the sake of ridiculing the resultant speech, sometimes for the sake of admiring it as a vigorous Doric dialect racy of the soil. Now, if this sort of work were done accurately, which it very rarely is, the impression produced by it would be utterly misleading. In nearly all cases it is both misleading and incomprehensible. The native of this country who reads this specimen of attributed peculiarities of speech finds a perfectly familiar expression followed by others which are as strange to him as they would be to Englishmen. For the difficulty with a large proportion of Americanisms is that they are local. Common in one section, they are utterly unknown in another. Yet, while local, it is no easy matter to assign them precise or at any rate restricted limits. Such is the constant movement of population on this continent that expressions the most remote from the ordinary speech of any particular community may be found in the mouths of individuals residing in that community. In this way an entirely erroneous impression is given of the extent to which particular words and meanings and phrases are used. But manufactured articles of the kind we have spoken of are no more representative of the American speech as used anywhere than similar articles made up from the dialects of the various English counties would represent the speech of any Englishman anywhere.

Another and probably far more potent reason for the attention now paid to this subject, is that whenever the average English reviewer comes across a word in an American author with which he is unfamiliar, he immediately sets it down as peculiar to this country. Especially is this the case when some phraseology occurs to which he has for any reason taken a dislike. Unhappily it is the fact that good and often brilliant as are the critical essays in English periodical literature, they rarely exhibit much knowledge of the history of the English language, or betray any too great familiarity with the extent of its resources. Hence it is by no means an unexampled thing for the writers of them to attribute to America the origin of words and phrases which have belonged to our speech from the earliest period, and have been ever since more or less in use. Too often, also, these imaginary peculiarities of speech are made the vehicle for expressing an ill-concealed dislike; for England, which has added and still continues to add so many illustrious names to the royal race of authors, is specially fertile in the production of fifth-rate men of letters, who feel it constantly incumbent upon them to express profound disappointment in first-rate nations or profounder dissatisfaction with their manners and ways.

The present dictionary, as it proceeds, will make clearer and clearer the falsity of the belief which fancies that there is an increasing difference between the language of England and that of America. Instead of diverging they are approaching. It is inevitable that in a period like the present this should be the case. The means of communication between the two countries are too abundant, the communication itself is too frequent, and the steadily widening influences of a common literature are too potent, to permit the development of any differences upon a large scale. The forces that make for unity will always be increasingly powerful over those that make for diversity. One of the functions of this dictionary, therefore, will be to teach the English-speaking race what are strictly Americanisms. It is for that reason that we have taken exception to the habit of appending U. S.—which in this Part, however, we have not happened to observe—to some

peculiar usage which has been found in some one author who happens to be a native of this country, or, what is worse still, is the chance creation of some newspaper of no value or authority whatever. Americanisms can never be successfully treated so long as there is a failure to recognize the distinction between what is peculiar to the individual and what is characteristic of the nation, or at least some section of it. *Cabbalism*, for instance, is given in this dictionary with a query for one of its meanings, for which two passages are cited from Emerson. Now, the word, with this particular signification, is properly not credited to the United States, though used perhaps exclusively by a native writer; for it is very certain that nowhere in this country are men in the habit of going about and talking of "cabbalism," whatever may be the sense in which it is employed.

The information already collected in this work has been sufficient to dispose of a number of so-called Americanisms. In this respect its value will steadily increase as it advances further down the alphabet. To consult it on this one point will become increasingly necessary to writers on both sides of the Atlantic. At least it will be necessary to those who feel hesitation about pronouncing dogmatic judgments on matters of usage. A practical illustration will make clear the service it will render. At this very moment of writing we find in a late number of one of the best English literary periodicals an article upon Prof. Bryce's recent work upon this country, in which he is taken to task for employing certain words designated as Americanisms, though it is probable that this is the first time that most of them were ever included under that category. One of them is the word *anyhow*, and this usage the present dictionary enables us to test. We find it put down with two senses, and with several citations, none of which are of American origin. The earliest recorded instance of its appearance in print belongs to the year 1750, and among the authors employing it are Carlyle, Brougham, Freeman, and Newman. This seems to dispose pretty effectually of the charge of its being an Americanism, and the authority of the writers using it will probably be reckoned by most as at least equal to that of the critic who condemned it.

To descend to particulars about Americanisms, we remark a few slight deficiencies. *Campus*, used in many colleges in this country to designate the grounds about the buildings, does not perhaps deserve an entry; at any rate it does not get one. The decoy game *bunko* is very imperfectly defined—a thing perhaps not to be wondered at in proceedings about which neither the victim nor the sharper is usually anxious to diffuse information. *Brakeman* is put down as an American equivalent of the English "guard." If the English "guard" corresponds to the American "conductor"—and this is the explanation usually given in dictionaries—the statement is an error. Still, the greatest divergence which exists between the speech of the two countries is in the matter of railway terminology; and where the variation is so marked and so wide, it is hardly safe for one not fully acquainted with the usage of both to express a positive opinion. *Bull-pout*, which is queried as the name of an unknown American fish, is the same as "bull-head." We notice with some surprise that the phrase *one's cake is dough* is marked as obsolete. It is certainly far from being so in the United States. And though not strictly allied to the subject, we will remark that the novel 'Brother Jonathan,' which has been quoted several times in the course of this work, is the production of the eccentric American writer John Neal, who was in England from 1823 to 1827.

With the discussion of one word we close what we have to say of Americanisms. This is the ancient *casus belli*, the term *Britisher*. Here we are told that it is "apparently of U. S. origin, and chiefly used by or attributed to Americans." This rather cautious statement is followed by the assertion that Mr. Richard Grant White disclaimed its use in the United States, while Mr. Fitzedward Hall has known of its currency here all his life. No one can say what has not been common somewhere in a country so vast as this. Nor in any ordinary case would any scholar hesitate between authorities like Mr. White and Mr. Hall. Yet in the present instance we are bound to say that the former strikes us as being in the right; that while *Britisher* may have been employed in some sections of the Union, it has never been employed extensively. That it is of wide currency cannot be said of it even now. But whatever may be the actual facts, the treatment of the word in this dictionary hardly bears out the belief to which the editors evidently incline. While it is spoken of as being used chiefly by Americans, the singular state of things remains that not one illustration of its use is furnished from an American writer. Marryat, Leslie, Freeman, Stevenson, and the London *Spectator* are quoted; the American author is distinctly conspicuous by his absence. Later evidence may show that the term originated in the United States. We submit that all the evidence the dictionary so far has procured is that it originated in England.

In conclusion, we call attention to some of the most interesting facts which are contained in the preface to this completed volume. They will perhaps furnish to most a fuller idea than any description possibly can of the scale upon which this work is carried on, and of the results that have already been accomplished. The first volume, containing the letters A and B, embraces words to the number of 31,254. This includes what are called the main words, the variant forms, and the compounds that have a distinct meaning. If, however, the self-explaining compounds, which find a place in it, be included, the number will exceed 40,000. This would imply under the first estimate of over 31,000 that in the completed work there will be about 270,000 words recorded. But as during the period of its progress new accessions will be constantly received, it is safe to assume that the latter part of the alphabet will be proportionately fuller than the earlier, and that in the completed work the number will probably exceed 300,000.

It gives, moreover, a vivid conception of the riches of the English tongue and of the preservative power of its literature to learn that, of the more than 22,000 main words recorded here, those reckoned as obsolete are less than 6,000. Many of these latter have in truth never had any real life. They are found in the books of scholars, but they never passed into the speech of any class of educated men. There are probably scores of words contained in this volume that have never been used save by the man who originally created them. They will always be interesting as tentative efforts to express certain ideas, and no one need grudge them the space that is given here, for it is of the first importance that the dictionary should register all the terms to which English literature in its earlier stages has given birth. This from its very nature necessitates slow progress, and the work has certainly gone on slowly. But it would be a fatal error to hasten it at any sacrifice of completeness or accuracy. Such a course would be the last to meet with favor from the special body of men who are the most deeply interested in its success. If accuracy and completeness continue to be secured in the future as within reasonable limits they have been secured in the past, no serious complaints about delay will be made by scholars who have at heart the long-neglected interests of English lexicography, and who do not care so much for a work being done as for its being well done.

RECENT WORKS IN PHILOSOPHY.

A Critique of Kant. By Kuno Fischer. Translated from the German by W. S. Hough, Assistant Professor of Philosophy in Michigan University. Pp. 188. London: Swan Sonnenschein, Lowrey & Co. 1888.

Physical Realism. Being an Analytical Philosophy from the Physical Objects of Science to the Physical Data of Sense. By Thomas Case, M.A. 1 vol., 8vo, pp. 387. Longmans, Green & Co. 1888.

On Truth. A Systematic Inquiry. By St. George Mivart, Ph.D., M.D., F.R.S. 1 vol., 8vo, pp. 580. London: Kegan Paul, Trench & Co.; New York: Scribner & Welford. 1889.

Prof. Hough, in his preface, expresses the hope that his translation may prove helpful to students of Kant, but we cannot avoid believing that he labors under an illusion. Mere translations of Kantian philosophy effect very little for this end. They are well enough appreciated and understood by those who have been fortunate enough, after long study and much patience, to have found their way into the penetralia of that system, but they are to be regarded by others much as savages would regard the Rosetta stone. The reason for this is, that translations are only transliterations, and custom allows them to be nothing more. The diversities of conception and phraseology between English and German are so great that no hope can ever be entertained of making Kant intelligible to the very persons for whom a translation is presumably meant, except by a thorough exposition in vernacular English. The extent of the misunderstanding which is occasioned by translations is well shown in the cases of John Stuart Mill and Herbert Spencer, both of whom knew German philosophy only by this indirect medium. Mill, although holding Kantianism in contempt, by a little insight on his part, or by a little rational exposition on the part of others, might have seen that his "permanent possibility of sensations" was a foundation for a more radical transcendentalism than Kant's, and that the only logical issue of it is identical with Fichte's solipsism. Of Herbert Spencer a recent writer has truthfully remarked, that "he is Hegel upside down"; and certainly a man who affirms that it is indifferent whether we express the ultimate reality in terms of consciousness, or in terms of matter and motion, has little reason to oppose absolute idealism. But the fact is a measure of the evil attributable to translations.

Of the technical work of the translator there is less to criticise; Kuno Fischer is an easy author to reproduce in English. But it would have supplied a greater want had Prof. Hough translated the larger work of the same author on Kant. There is a most decided weakness in the uniform interpretation of *Vorstellung* as the German equivalent of "idea." Had the translator been acquainted with Sir William Hamilton's note on the history of that term, and the interminable confusion produced by it

in philosophy after Locke, he would have been more discriminating.

'Physical Realism' comes from Oxford, and is chiefly of interest because it marks a reaction against the influence of T. H. Green in that university. The whole work betrays the method of psychological analysis and the historical subject-matter peculiar to Green, but the position assumed and the mode of argument are designed directly to counteract the whole scheme of idealism. It is true that the author, in the chapter on Kant's 'Critique,' has scarcely entered the threshold of transcendentalism; but in assuming the position of the physical sciences he is sure of sympathy from that triumphant spirit with which, somehow or other, philosophy has never been able to reckon successfully. This opposition to idealism is all the more significant coming, as it were, from the very ranks of Green's students, so soon after the most earnest of English philosophers had cast off his mantle, because the returning swing of the pendulum may be accompanied by a theory from which the author will have more to fear than from idealism. But the most timely observation is one which needs to be better known, or more honestly admitted, than it is. People have got the impression, which philosophers have been interested in encouraging, that idealism is a vantage ground for religion, and so opposed alike to materialism and atheism. But the author very justly observes:

"A philosopher may hold that God causes physical nature and man apprehends it. He may be theologically an idealist, psychologically a realist. On the other hand, he may suppose that all sensible data are psychical facts, and yet doubt the existence of God. He may be psychologically an idealist, theologically an atheist. The founders of natural theology had no thought of making psychical facts the beginnings of human knowledge. The followers of Hume hardly consider themselves supporters of the doctrine that God created the world. These distinctions are of importance, because there is a crude notion in our times that idealism in mental philosophy is necessary to theology."

Mr. Case, however, is not a sceptic. On the contrary, he is an orthodox dualist, as well as a "physical realist"; and as the only argument for dualism he gravely quotes the language of Jesus to his doubting disciples after his resurrection. If this is to be the consummation of the matter, we should be tempted to accept idealism out of sheer despair. Otherwise, the work has critical merit of a high order.

St. George Mivart, in five chapters, also opposes idealism upon the grounds of physical science; but he has the misfortune of not understanding the theory, since he identifies it with the denial of an external world. This is the common fault of the scientific mind. Mivart has been one of the ablest of Darwin's critics, and so is a specialist in the problems of evolution, although a work some years ago on 'Nature,' as well as the present one, shows considerable ability in metaphysics. But this on 'Truth' is a kind of summary of the author's views on psychology, physiology, geology, and theology, and may be interesting to those who care to see what a specialist knows about everything. The work is not without merits of its kind, but it is mainly an attempt to defend theism against the supposed atheistic tendency of Darwinian evolution. We would venture to ask the author, what is to be gained by setting up deity behind the process of evolution, when that process is presented to us only as an exhibition of power? The conception of God is a complex one, including the notion of a creative first cause and the idea of moral perfection. The phenomena of nature in demanding a first cause to explain them may present no traces of such moral action and order as would make it necessary or valuable to use the name of God in connection with them. There is no necessary connection between power and virtue, or between physical causes and moral ideals. Hence, in attempting to vindicate theological beliefs about the relation of God to nature, we may forget the surreptitious reasoning involved in supposing that the use of this conception to satisfy the demands of causal explanation will carry along with it any implication of moral qualities. We can at best be but cultivating an agreeable illusion, much as the saint who counts his beads with a belief in their spiritual efficiency. The author does not seem to be conscious that his first problem is to prove that "the survival of the fittest" is compatible with the moral ideal which the conception of God contains. Until he does this, he is only defending phrases for the sake of their associations.

A White Umbrella in Mexico. By F. Hopkinson Smith. With illustrations by the Author. Boston: Houghton, Mifflin & Co. 1889. Pp. 227.

THIS dainty book tempts the critic to superlatives of praise; it is such a breath of spring after the wintry wastes through which other writers of books on Mexico have compelled him to toil, it is so thoroughly successful in the single line the author proposes to himself to follow, and so faithfully reproduces the most unique savor of Mexican life. The writer knows nothing of Mexican trade or politics or statistics—let the reader thank heaven for that, and take courage. Mexican archæology and history he puts firmly to one side; would that many of his predecessors had done the same! He is content, as he himself says, to

"revel in an Italian sun lighting up a semi-tropical land; to look up to white-capped peaks towering into the blue; to look down upon wind-swept plains encircled by ragged chains of mountains; to catch the sparkle of miniature cities jewelled here and there in oases of olive and orange; and to realize that to-day, in its varied scenery, costumes, architecture, street life, canals crowded with flower-laden boats, market plazas thronged with gayly dressed natives, faded church interiors, and abandoned convents, Mexico is the most marvellously picturesque country under the sun. A tropical Venice! a semi-barbarous Spain! a new Holy Land!"

In a word, Mr. Smith gives us in this book what has never before been worked out so fully and so delightfully—the immense charm which Mexico has for a Bohemian saunterer, with a keen eye for the artistic, and a decided preference for the society of beggars and idlers and sacristans. Others have hinted at all this often enough; he is the first to give himself and his book wholly up to it. We must let him state the matter again, writing this time of Zacatécas:

"No such scene exists in any quarter of the globe where I have wandered: a brilliant sky, blue as a china plate; blinding sunlight; throngs of people in red, orange, or blue; women in rebozos and scarlet sashes; men wearing vermilion zarapes about their shoulders, with wide hats trimmed with silver, and breeches of pink buckskin held together down the sides by silver buttons; donkeys piled high with great sacks of silver ore; cavaliers on horseback, with murderous rowels in the heels of their riding boots, their Mexican saddles festooned with lassos and lariats; soldiers, carrying carbines and mounted on spirited horses, guarding gangs of convicts, each one of whom staggers under a basket of sand held to his back by a strap across his forehead; great flocks of sheep blocking up the narrow streets, driven by shepherds on horseback, changing their pasture from one hillside to another—the whole completes a picture as strange as it is unique."

Mr. Smith appreciates as highly as many of his predecessors the architectural and artistic treasures to be found in so many Mexican churches. We do not remember that any one, however, has so roundly denounced the madness of those restorers and renovators who have already gone fearful lengths of hideousness, and whose career seems yet to be far from a close. He gives expression to a fear, in one case, which many others must have felt in many cases:

"Some day they will take up a collection, or an old Don will die and leave a pot of money, 'to restore and beautify the most holy and sacred, the church of Santa Clara,' and the fiends will enter in and close the church, and pull down the old pictures and throw away the lamps, chairs, and candlesticks, and whitewash the walls, regild the huge frame of the sacristy door, and make dust-rags of the pomegranate silk. Then they will hang a green and purple raw silk terror, bordered with silver braid, in its place, panel the whitewashed walls in red stripes, bracket pressed-glass kerosene lamps on the columns, open the edifice to the public, and sing Te Deums for a month in honor of the donor."

The publishers have done their best to give Mr. Smith a proper setting-out, and the book's heavy paper and wide margins and cover of white and gold and gray make up a very pleasing total. For the illustrations one ought to be profoundly thankful if only because they are new; the deplorable old plates which have so long gone the rounds can easily be spared. But Mr. Smith's sketches have more than this negative merit; they seem to us to be on too small a scale, as a rule, to yield the best effects, but they are most thoroughly worked out, are usually characteristic bits, and somehow fit in better with the good-natured and ostentatiously lazy air of the book than would more ambitious work. A few slips in Spanish, and an occasional failure to hit off usage, help to reëstablish the critic in his belief in the fallibility of mortals.

Sigurd Slembe: A Dramatic Trilogy. By Björnstjerne Björnson. Translated from the Norwegian by William Morton Payne. Boston: Houghton, Mifflin & Co. 1888.

THIS poem is presented by the translator as the finest work of Björnson, and it is clear that great care has been devoted to the English of the version, but it has not been rendered so successfully as to make it an English poem. The story is a long one. It is divided into three parts, corresponding to three periods in the life of the hero. Sigurd was an illegitimate son of Magnus Barfod of Norway, and, on learning the secret of his birth, makes it the aim of his life to obtain his rightful place as a sharer in the crown to which he is heir. He determines to go on crusade first, and by accident comes to Scotland, where he remains in the service of the King, and is attracted to a feud going on in the Orkneys, which he feels called upon to settle. He obtains power there, but fails to use it, and at last deserts the place, notwithstanding he has won the love of a maiden with whom it is "death" to part. He then goes on crusade for several years, returns to Norway, claims his place peacefully, and is refused his right: his mind is embittered by seeing the state of affairs, and after a while he gathers an army and fights for his crown, but is beaten and dies.

The poem, not being a drama, is not dependent on these events for its interest. It is, in fact, what it is now the fashion to call the history of a soul; and it does not avoid the danger of such a poem—it falls between two stools. It is neither dramatic nor psychological, neither action nor thought; but one phase is continually interfering with the other, to the blur

and confusion of both. One fails to see why Sigurd, who is eminently a man of action, is unable to take wise and definite resolutions at the proper moment; and as to the other characters, they strike a foreigner as very primitive types. A scene may be laid in the childhood of nations, but the hero of a psychological drama must be more than a Fortinbras; and the most real part of this poem is its blood and savagery, not its introspection. The incapacity of the characters even for practical thought is amazing; none of them—except *Koll*, who is a kind of oracular owl—behaves with sense in the circumstances; indeed, when *Harald*, an exceedingly childish imitation of *Hamlet*, and the King, who is no more nor less than an imbecile, are included, the whole poem offers a mélange of mental incompetency which it would be hard to rival. There seems to be a Christian lesson at the bottom of it all, but it is difficult to make out anything more than that a heavenly inheritance is better than the Norwegian crown; and Sigurd had spiritual experiences, but they are not defined or motived so as to be made necessary parts of his life.

Altogether, the poem seems to us a "sport," such as native literatures show examples of not infrequently in their early development, owing to unreconciled elements in the culture and the material of the poet—neither pagan nor Christian, neither action nor reflection, neither idyl nor real life, but a mixture of all these. Yet it is to be remembered that in the Scandinavian and Teutonic imagination there is often a *simplesse* which is a stumbling-block to the taste and interest of the foreigner. It is needless to say that in passages independent of the action there is often poetical feeling, especially where landscape is used as a background; and there are also interesting expressions of political ideas bearing on the general lot of man and the character of aristocracies. But this is a modern note wholly out of keeping. In Norway the poem is highly regarded, and consequently it must fall in with national feeling and ideas, by a harmony the secret of which is unknown to us.

John Lee of Agawam (Ipswich), Massachusetts, 1634-1671, and his Descendants of the name of Lee. With genealogical notes and biographical sketches of all his descendants, so far as can be obtained, including notes on collateral branches. Compiled by William Lee. Albany: Joel Munsell's Sons. 1888. 8vo, pp.

THE name Lee (or Leigh) is quite common in England, especially in Cheshire, and several distinct and unconnected stocks have been planted in the New World. The book under notice traces the Ipswich family, descended from a John whom a dubious tradition states to have been born at London. This branch has prospered and increased, and has found a very careful and diligent historian. We cannot commend the rather diffuse style of printing adopted, but that is our only criticism, and we doubt not the book will be warmly received by the family, while it secures an honorable place on the shelves of the collector.

BOOKS OF THE WEEK.

Adams—Cunningham. The Swiss Confederation. Macmillan & Co. $4.
Bastin, Prof. E. S. College Botany, including Organography, Vegetable Histology, Vegetable Physiology, and Vegetable Taxonomy. Illustrated. Chicago: G. P. Engiehard & Co. $3.
Boardman, Rev. G. D. The Ten Commandments: A Course of Lectures delivered before the University of Pennsylvania. Philadelphia: American Baptist Publication Society. $1.50.
Browning, R. Poetical Works. Vols. XI. and XII. Macmillan & Co. $1.50 each.
Callendar, H. L. A Manual of Cursive Shorthand. Macmillan & Co. 50 cents.
Church, Rev. A. J. Henry the Fifth. Macmillan & Co. 60 cents.
Deighton, K. The Winter's Tale; with an Introduction and Notes. Macmillan & Co. 60 cents.
Eliot, Annie. An Hour's Promise. Cassell & Co.
Fitzgerald, Caroline. Venetia Victrix. Macmillan & & Co. $1.25.
Fox, W. F. Regimental Losses in the American Civil War. 1861—1865. Albany Publishing Co.
Franklin, Rev. B. Marriage and Divorce in Physical, Psychical, Moral and Social Relations; according to the Law Natural and Revealed. E. & J. B. Young & Co. $1.50.
Hall, Rev. J. G. Shakespeare versus Ingersoll. Cleveland, O.: The Burrows Brothers Co.
Hardy, A. H. The Maid of Bethany: A Study of the Christ. Springfield, Mass.: Author's Edition.
Harper—Burgess. An Inductive Latin Method. Ivison, Blakeman & Co.
Hamilton, Prof. D. J. A Text-Book of Pathology, Systematic and Practical. Macmillan & Co. $6.25.
Hauff, W. The Caravan, and the Sheik of Alexandria. Translated by S. Mendel. Scribner & Welford. 60 cents.
Hubbard, J. M. Catalogue of the Works of William Shakespeare, Original and Translated, together with the Shakespeariana embraced in the Barton Collection of the Boston Public Library. Boston.
Hughes, T. English Men of Action: David Livingstone. Macmillan & Co. 60 cents.
Jackson, A. W. The Immanent God, and Other Sermons. Boston: Houghton, Mifflin Co. $1.
Jerram, C. S. Græce Reddenda: or, Miscellaneous Exercises for Practice in Greek Prose Composition. Macmillan & Co. 60 cents.
Judas Iscariot: An Old Type in a New Form. Minerva Publishing Co. 50 cents.
Littell's Living Age. Vol. 180. January—March, 1889. Boston: Littell & Co.
Living Voices of Living Men: Practical Sermons by Bishops and Clergy of the Church. Thomas Whittaker. $1.25.
Lossing, B. J. Hours with the Living Men and Women of the Revolution: A Pilgrimage. Illustrated. Funk & Wagnalls.
Macknight, J. A. Hagar. Belford, Clarke & Co.
Macmillan, Prof. M. Scott's Rokeby. With Introduction and Notes. Macmillan & Co. 90 cents.
Moody, Martha L. Alan Thorne. Boston: D. Lothrop & Co. $1.25.
Powers, J. E. The Modern Store, and How to Be a Salesman in It. Kilbourne Tompkins. 25 cents.
Robertson, W. Life and Times of the Right Hon. John Bright. New ed. Cassell & Co. $1.50.
Saunders, F. The Washington Centennial Souvenir. Thomas Whittaker. 25 cents.
Seneca's Minor Dialogues, together with the Dialogue on Clemency. Translated by Aubrey Stewart. Scribner & Welford. $2.
Steel, C. F. Is there Any Resemblance between Shakespeare and Bacon? London: Field & Tuer.
Symons, A. Days and Nights. Macmillan & Co. $1.75.

Fine Arts.

THE ACADEMY EXHIBITION.

THE present exhibition of the National Academy of Design is not the best it has held, yet it contains many more good works than one would at first imagine. The hanging has not been judicious, and the general effect of the galleries is disturbing and disagreeable, and the good work must be patiently looked for before it is found. Much of it is almost out of sight on the top row, and the rest of it is apt to lose from ill-chosen surroundings. Nearly all of the portraits have, by a singular whim, been placed together in the small east room, and the rows of life-sized figures thus seen together in a restrained space have an unpleasant effect. At the same time, their absence from the other galleries, where they would have been available, from size alone if from no other quality, as centring masses around which to gather the smaller canvases, gives these rooms a meagre and scattered appearance. Another result of the gathering together of some sixty portraits in one small room is that many of them must be sacrificed in the hanging, and it is, therefore, not astonishing to find that some of the best of them are "skied."

There is no better portrait in the exhibition than that, by Mr. Vinton, of William Simes, No. 245, which is so placed. It is good, clean, vigorous work, with a strong feeling of vitality and character about it—not a lovely canvas, but it represents a *man*. Mr. Vinton's other portrait, No. 303, which is on the line, is also a workmanlike piece of painting, but is not equal to the first in interest. Another of the good things is Mr. W. M. J. Rice's portrait of a lady seated at the piano, No. 257, which, though a trifle dry and hard, is a grave and serious effort, good in drawing and character, and deserves a better place than it has found. Other portraits which, while not as good as these two, yet seem to us to be too good for the lofty positions they occupy, are Mr. Denman's portrait, No. 307, and a pleasantly conceived and executed three-quarter length, No. 262, "Sister Lillie," by Edmond E. Tarbell. Mr. Wyatt Eaton is also among those who hold the top of the wall, but his picture this year is singularly infelicitous, and does not recall the painter of so many fine and sober works.

When we come down from these heights, and look at the portraits which are nearer the eye, we find, very naturally, that Mr. Chase first demands our attention. His "Lady in Pink," No. 251, is a delightful bit of color and of skilful handling, but the sitter is perhaps a little sacrificed to the gown, and the head is less satisfactorily solid and human than in some other of the artist's works. If, however, it is too much a picture of a gown, the gown itself is superbly painted. Mr. Eastman Johnson is represented by a sound and satisfactory "Portrait of a Gentleman," No. 260, and a less satisfactory portrait of a boy; Mr. Blashfield, by a handsome and vigorous, but somewhat too academic portrait of a lady; Mr. Millet, by a delicately painted "Portrait of Miss W.," No. 279; Mr. Frank Fowler, by a clever head entitled "Jeanne" and a portrait; and Mr. R. G. Hardie, by a workmanlike portrait of Mr. Horace White. Mr. Dewing has a small bust-portrait of a lady here, No. 304, and a small full length of a "Girl in Black," No. 386, in the South Gallery, which possess the unmistakable distinction that marks his work, but which seem to us less fully successful than the "Lady in Yellow" of last year, or the even more beautiful portrait exhibited at the Society of American Artists two years ago. They are delicately and beautifully drawn, but the "Girl in Black" is certainly too tall, and both pictures seem a trifle artificial in color. Nevertheless they are among the best things in the exhibition. Mr. Beckwith's little head called "Monsieur est servi," No. 247, is in his best vein of direct and free painting, and is cooler and better in color than some of his efforts have been.

The place of honor in the South Gallery has been most properly given to Mr. Hovenden's large canvas, "In the Hands of the Enemy (after Gettysburg)," No. 360, which is by odds the most important piece of genre in the exhibition. The story told is a serious one, which is as well if we are to have stories in paint, and it is well and dramatically told, without suspicion of melodrama or exaggeration, but with right moderation and reserve. The abstinence from blood is especially noteworthy. While without any special charm or brilliancy of technique, it is thoroughly and soberly painted; and in one part, the group to the left lit by the window with its drawn curtain, the painting is nearly beautiful. The only serious fault of the picture is the slip in the drawing of the head of the girl who stands behind the wounded Confederate's chair, and the smallness of her hand, which give a slightly petty air to the composition. Take it for all in all, it is a most meritorious performance, and is certainly the best thing that Mr. Hovenden has yet done.

Two other genre pictures that will probably come in for consideration when the prizes are given (Mr. Hovenden being an Academician, and therefore ineligible) are Mr. Blum's "Two Idlers," No. 132, and Mr. Wiles's "Sonata," No. 234. Mr. Blum's picture is astonishingly clever and able, and contains delightful bits of painting which for technical quality could not be surpassed by Boldini himself, but he has either not cared for or not succeeded in preserving truth of value, and some of the tones

in the foreground are much lighter than they should be in relation to the sunlight beyond. Mr. Wiles's canvas is of evener merit, and while it has nothing quite so charming in it as some bits of the other, it is free from the faults of the other also. Both pictures are so good that the Clarke prize would be well bestowed upon either.

Two good bits of work by young Americans residing abroad, which deserve better places than have been given them, are Mr. Simmons's "Old Man and Child," No. 429, and Mr. Theodore Earl Butler's "A Widow," No. 421. Mr. Butler is a very young man, who has been studying in Paris for a few years, and this is, we believe, the first picture he has sent back. It is a grave and serious piece of work, and gives decided promise for the future. Mr. Simmons's work is already well known, and this piece of it is well up to his standard. Another piece of solid and quiet painting, possibly a little dry and lacking in atmosphere, but careful and realistic, is Mr. Ward's "Block Maker," No. 354. A large picture, which we hardly know whether to class as genre or historical painting, is Mr. C. S. Pearce's "Saint Genevieve," No. 494. It contains much good drawing and clean, respectable painting, but is painfully hard and airless.

Mr. H. Siddons Mowbray falls something below his best standard in the present exhibition. His "Arcadia" and "The Calendars," Nos. 513 and 317, contain, as a matter of course, much skilful and charming painting, but the latter is confused in perspective, and neither seems as careful and thorough in drawing as his work is wont to be. Mr. F. C. Jones is also less well represented than we could wish. Mr. R. V. V. Sewell and Mrs. Amanda Brewster Sewell send pictures showing careful observation and conscientious painting of figures in the open air, but their work is most interesting from its remarkable similarity. Another lady, Miss Frances Hunt Throop, sends a half-length figure of a little girl in a black dress, entitled "Spring Carnations," No. 182, which shows painter-like qualities, as does Mr. C. R. Grant's "The Morning News," No. 380.

Mr. Theodore Robinson, who has just returned from France, where he has been strongly influenced by Claude Monet and the Impressionists, sends a curious little canvas entitled "A King's Daughter," No. 471, in which a naïve classicism in subject is combined with extreme impressionism in handling. It is full of light and air, and the upper part of it is beautiful in form as well as in color, but the artist seems to have tired of his work before he had completed it, and the lower portion is less happy. As the picture stands, however, it is refreshingly airy and sunny, and makes the pictures about it seem heavy and painty by comparison. From the treatment of the nude Mr. Brush's naked Indian "Potter," No. 527, stands halfway between genre and the classic in art. Mr. Brush's severe, minute, and somewhat hard manner is well known and is well exemplified in the present work. The man's body is strongly drawn and modelled, and the painting of the leopard-skin and other accessories is wonderful in its way; but he has apparently found no model having the desired type of features, and has painted the head from memory or imagination, with some loss of solidity and construction.

Of the strictly classic there is very little in the Academy, the chief exceptions being Mr. Low's "Purple and Gold," No. 445, with its powerful and somewhat acid color scheme; Mr. Henry O. Walker's pleasing "St. John," No. 514; Mr. G. R. Barse's "Polyxena," No. 152, which shows knowledge and draughtsmanship, but is somewhat heavy and unpleasant in color; Mr. Frank W. Benson's cleverly but slightly painted "Orpheus," No. 483; and Mr. Maynard's "The Scroll," No. 394. Mrs. Rosina Emmett Sherwood ought to have a very good chance for the Dodge prize with her little pastel called "A Nymph of Hymen," which is a very graceful production.

We now come to the landscapes of the exhibition, and from its size, as well as from the leading position among our landscape painters occupied by its author, Mr. Inness's "Coming Storm," No. 325, falls first to be considered. The picture is somewhat crude in color, and less harmonious and complete in treatment than most of Mr. Inness's later work, but has a grand dramatic power which makes one willing to forgive its shortcomings. It is not seen to so good advantage here as it was in his own studio, and needs a few moments of attention before its merit is appreciated, but after these few moments its force makes itself felt, and it inevitably produces a profound impression. Very different is Mr. Wyant's "Landscape," No. 347, with its delicate, pearly tonality and quiet charm. Mr. Thomas Moran has two pictures, of which the smaller, a "Venice," No. 183, though exceedingly clever, shows somewhat too strongly the influence of J. M. W. Turner. The larger, "A Pastoral," No. 383, possesses an undeniable scenic grandeur which would make one wish to see it as a back-drop in a production of "As You Like It." Its only fault as a composition is that it is a little too perfect, so that one feels that its trees and ponds have displayed considerable ingenuity in placing themselves so admirably. Mr. Homer D. Martin has two pictures, of which the smaller, called "Incoming Tide," No. 11, which is relegated to the corridor, is the better, and is a handsome piece of gray color.

Among the younger landscape painters, Mr. H. Bolton Jones, with an "Autumn," No. 328, in his familiar vein, Mr. Tryon, with a delicate piece of blue, called "Evening," No. 457, and Mr. Edward Gay, with his "Happy Summer Fields," No. 388, hold the first rank. Mr. J. Alden Weir is not as happy as he usually is in his "Rugged New England," No. 57, which is over-cold in color and over-pasty in handling to be altogether pleasant. Three very good landscapes which have been very badly placed are Mr. Eichelberger's "Harlem River," No. 430, Mr. Birge Harrison's "October in France," No. 537, and Mr. Charles H. Davis's "April," No. 547, while the worst treated picture in the whole exhibition, its merit considered, is Mr. W. A. Coffin's study of "The Rain," No. 34, a remarkably vigorous and truthful transcript of a difficult effect.

Mr. Horatio Walker, who may be classed as a landscape painter for the nonce, has a picture of some calves in a green field, No. 459, which he calls "Spring," and which has much of his usual refinement and charm. Mr. F. De Haven has an "Evening," No. 188, and Mr. W. Forsyth a "March," No. 215—handsome if sombre canvases both—and Messrs. Murphy, Palmer, Shurtleff, Bruce Crane, and Van Boskerck are fairly represented.

There is, as usual, but little sculpture, and what little there is is less fine than last year. Neither of Mr. Warner's contributions is as good as his fine bust of J. Alden Weir, nor is Mr. St. Gaudens's medallion of Robert Louis Stevenson, interesting as it is, equal to the best that he has done in this line. Mr. F. Edwin Elwell has a couple of clever sketchy busts in the picturesque manner that seems to be growing upon the sculptors of to-day, and Mr. French has a well-modelled bust of a boy.

As we have had some fault to find with the hanging of this collection, let us, in conclusion, do the Hanging Committee the justice to say that they have been very moderate in the amount of line-space appropriated for their own works.

It is to be regretted that the catalogue was not more thoroughly revised, as misprints, which must be annoying to the artists, are far from uncommon.

SCRIBNER & WELFORD'S

NEW BOOKS.

Poems and Translations.

By W. J. LINTON, author of 'Claribel and Other Poems,' 'Love Lore,' 'Poetry of America'; joint editor with R. H. Stoddard of 'English Verse.' Limited edition, printed on handmade paper, with photogravure portrait. Small 4to, half German calf, parchment sides, net $5.00.

Mr. Linton's fame as a wood-engraver has somewhat obscured his merits as a poet. His two volumes, 'Claribel and Other Poems' and 'Love Lore,' were both published in very limited editions, and are both now extremely scarce. In the present volume nearly all the poems in these works are included. The collection will also contain many renderings, in the original meters, of French poems, ranging from the thirteenth century to our own day. These translations are, with few exceptions, published for the first time. A portrait of Mr. Linton is prefixed to the book.

The Alps.

By Professor F. UMLAUFT, Ph.D. Translated by Louisa Brough. With 110 illustrations (many full-page) and 2 maps. Illustrated cover in colors. Demy 8vo, cloth, $5.25.

This volume, which is illustrated by a large number of wood engravings, gives a comprehensive view of the topography of the entire Alpine range. It will be of permanent value to those who have visited, or propose to visit, Switzerland or the Tyrol, as it deals not only with the scenery, but also with the roads and railways, lakes, rivers, and valleys, geology, flora, and fauna, of the whole district.

The Multum in Parvo Atlas of the World.

By W. and A. K. JOHNSTON. Comprising 96 double-page maps, political, physical, etc.; useful statistics with each map, complete index, etc., etc. Crown 16mo, cloth, $1.00.

The most complete, accurate, and thorough Pocket Atlas ever issued.

Darwinism and Politics.

By DAVID G. RITCHIE, M.A., Fellow and Tutor of Jesus College, Oxford. 12mo, cloth, $1.00.

Napoleon at St. Helena.

By BARRY O'MEARA, Body Surgeon to the Emperor. A New Edition, with copious Notes, Biographical Sketches of Sir Hudson Lowe and the Author, and other additions, including Appendices of great value, containing a complete Napoleonic Kalendar, the Napoleonic Roll of Honor, etc. The whole embellished by Colored Plates, several Portraits of Napoleon, Woodcuts, and other Illustrations. Two vols., demy 8vo, decorated cloth, $10.00.

Amongst the other new matter in this edition there is an account of the principal personages on the island, which should afford a better knowledge of their past services and qualifications. There is also a chapter briefly continuing the work from 1818 to 1821, for purpose of casual reference. The bulk of the notes throughout the book are new. There is a fresh portrait of Napoleon at St. Helena, taken only three months before his death, and a copy of a picture by Horace Vernet. The new Indices, the Napoleonic Kalendar—interesting from the association of so many redoubtable persons and events with the glorious career of one man—and the reference List of Titles, it is hoped, may prove serviceable to Napoleonic readers generally.

NEARLY READY.

The Heimskringla; or The Sagas of the Norse Kings.

From the Icelandic of SNORRE STURLASON. By SAMUEL LAING, Esq. Second Edition, revised, with Notes, by RASMUS B. ANDERSON, LL.D., United States Minister to Denmark, author of 'Norse Mythology,' 'Viking Tales of the North,' and other works. With 2 Maps. In 4 vols., 8vo, cloth, net, $20.00.

"Snorre Sturlason's History has in it a great deal of poetic fire, and deserves, were it once well edited, furnished with accurate maps, chronological summaries, etc., to be reckoned among the great history-books of the world."—*Thomas Carlyle.*

"An acquaintance with the ancient runes, with the Eddas, with the Heimskringla, and with the old Saga-lore, should be the pride of every Englishman and American."

*** The above books sent upon receipt of advertised price. Catalogues of our regular stock, also complete lists of all Bohn's Libraries, will be mailed, if desired, to those interested. New catalogue of choice and rare books ready.*

JUST PUBLISHED.

"A brilliant picture of Napoleon."—*New York Times.*

AN AMERICAN EDITION OF BOURRIENNE'S FAMOUS

Memoirs of Napoleon Bonaparte

By LOUIS ANTOINE FAUVELET DE BOURRIENNE, his Private Secretary. Edited by Col. R. W. PHIPPS. New and Revised Edition, with 34 full-page Portraits and other Illustrations. The set, 4 vols., 12mo, in a box, $5.00.

"*The only authentic Memoirs of Napoleon which have yet appeared.*"—Prince Metternich.

For sixty years Bourrienne's 'Memoirs of Napoleon' has been a standard authority to which every one has turned for a graphic, entertaining picture of the man as he appeared to his intimate friend and secretary.

This American edition contains the thirty-four portraits and other illustrations of the original, together with all the other features that give distinction to the work—the chronology of Napoleon's life, the prefaces to the several editions, the author's introduction, and the additional matter which supplements Bourrienne's work, an account of the important events of the Hundred Days, of Napoleon's surrender to the English, and of his residence and death at St. Helena, with anecdotes and illustrative extracts from contemporary memoirs.

Ready on Saturday. A Novel by Mr. Froude.

The Two Chiefs of Dunboy.

An Irish Romance of the Last Century. By James Anthony Froude. 12mo, paper, 50 cents; cloth, $1.50.

Mr. Froude is as fascinating in romance as in history. His novel has all the absorbing adventurous interest of a story by Scott. It is crowded with dramatic incident and its portrayal of the fierce passions and picturesque characters of the Ireland of the eighteenth century is as powerful as it is vivid. The style has all Mr. Froude's accustomed brilliance and charm, and the historical significance of the book, added to its rare qualities as fiction, makes it a masterpiece of the first rank.

The Erckmann-Chatrian National Novels.

A new edition in six volumes, with illustrations, an introduction, prefaces, etc., etc. 12mo, each, $1.25; the set in a box, $7.50.

"*These are among the few French novels that do not leave (as Charlotte Brontë said) a bad taste in one's mouth.*"—Col. Thomas Wentworth Higginson.

The publication of a new edition of the 'Erckmann-Chatrian National Novels' comes at a time when French fiction as represented by Balzac, Hugo, Daudet, and others is attracting unusual attention in this country. The stories of M. Erckmann and M. Chatrian scarcely need a word of explanation, as their literary merits and their historical value have been fully appreciated both by the critics and the public.

The Nation.

NEW YORK, THURSDAY, APRIL 18, 1889.

The Week.

THE Secretary of the Treasury on the 13th inst. broke the monotony of the recent calls of bond purchases by accepting a round amount of 4 per cents, for which he paid 129. For a long time past, the Department seems to have tabooed the 4 per cents, confining its purchases to the 4½s, and paying 108 for that issue. At the beginning of April, there are but $155,000,000 of the 4½s outstanding, against $681,000,000 of the fours; so that the area of purchase is very largely increased by the addition of the latter class. The purchase may be taken as an indication that Secretary Windom has now got down to business, and the time is therefore suitable for some remarks as to the policy of the Treasury towards the banks and the money-market. And first, it deserves to be recorded that Mr. Fairchild was the first Secretary of the Treasury to develop the system of Government deposits with the national banks as a mode of regular and permanent relief to the money market, in mitigation of the constant injury inflicted upon all trade and industry by the preposterous hoards of the Treasury. No Secretary is likely hereafter to undo this work, but Mr. Windom has an opportunity to improve it, and in two ways. He can rule, in accordance with the uniform practice before the decision of the late Comptroller of the Currency, that Government deposits require no reserve in lawful money; the pledge of United States bonds being ample, and so considered in the statute. And he can make his deposits at once more business-like and more favorable to the Treasury by requiring a small rate of interest upon them, say 2 per cent., if, upon consideration, such a course shall be found to be lawful. With $45,000,000 of bonds held as security for such deposits, and some $50,000,000 of available surplus, the requirement of interest would tend to facilitate bond purchases, and ample notice should be given of the intended change.

With regard to the bond purchases, it must be remembered that the 4½ per cents fall within the control of the Treasury in the autumn of 1891, and Mr. Windom will doubtless be inclined to repeat with this issue the success which he had in his former incumbency of his present office. Whatever amount of the 4½ per cents remains alive at the date of their maturity in 1891 can be extended on call at the pleasure of the Government, and probably at as low a rate as 2½ per cent. It seems desirable, therefore, that the 4 per cent. bonds should be the bulk of the Treasury purchases until that time; provided, of course, that they are not held too high. The question of interest on the Treasury deposits has a direct relation to this.

Three other New York editors are now added to the list of those who are in search of office. Prof. Charles E. Fitch of the Rochester *Democrat and Chronicle* aspires to be made a Collector of Internal Revenue; Col. W. J. Morgan of the Buffalo *Commercial Advertiser* hopes to be made Collector of the Port of Buffalo; and the Hon. John M. Francis of the Troy *Times* is so eager to get almost any kind of office that he has been to Washington in person in search of it. The number of Republican editors who have been subsidized by office, and the number who are said to be hoping for subsidy, now make a formidable list, as will be seen by the following enumeration:

SUBSIDIZED.

Whitelaw Reid, editor New York *Tribune*, Mission to France.

Allen Thorndike Rice, editor *North American Review*, Mission to Russia.

Murat Halstead, editor Cincinnati *Commercial Gazette*, Mission to Germany.

John A. Enander, editor Chicago *Hemlandet*, Mission to Denmark.

J. S. Clarkson, editor *Iowa State Register*, First-Assistant Postmaster-General.

John Hicks, editor Oshkosh *Northwestern*, Mission to Peru.

John C. New, editor Indianapolis *Journal*, Consul-General at London.

Ellis H. Roberts, editor Utica *Herald*, Assistant United States Treasurer at New York.

REPORTED AS SEEKING SUBSIDY.

Elliott F. Shepard, editor *Mail and Express.*

John M. Francis, editor Troy *Times.*

Charles E. Fitch, editor Rochester *Democrat and Chronicle.*

W. J. Morgan, editor Buffalo *Commercial Advertiser.*

The effect of the subsidy is perceptible in many ways, but especially in the treatment by the subsidized journals of the appointment of Van Cott as Postmaster of New York. Every one of them defends and approves it. It is a fact, also, that the newspapers which were boldest in inventing in advance lying excuses for Mr. Pearson's removal, were the Rochester *Democrat and Chronicle* and the *Troy Times.*

Gen. Joseph C. Jackson of the Union League Club has, according to the *Commercial Advertiser*,

"been put forward as a candidate for United States District Attorney of this District, and his appointment has been asked for by a justice of the United States Supreme Court and by prominent journalists, lawyers, and business men, including Democrats as well as Republicans."

He ought not to get the place, however, unless he subscribed more handsomely to the campaign fund than we think he did—that is, at least as handsomely as Mr. Allen Thorndike Rice, whose contribution, which we thought was only $10,000, was, it appears, $15,000. The United States District Attorneyship at this point is worth more to a lawyer than the Russian mission to an editor, and ought to be down in the tariff at least at $15,000. We would not, were we in President Harrison's place, let Gen. Jackson have it for a cent less. If he has not paid the money already, he can send it to Quay *nunc pro tunc.*

The statements attributed to Secretary Noble in a recent interview as to his intention to make a clean sweep of the Democrats in the Interior Department as rapidly as possible, and fill the places thus made vacant with Republicans, were so extraordinary that we refused at first to accept them. But the Secretary has declined to avail himself of an opportunity to set himself right if he was misreported, and the correspondent of the Hartford *Times* quotes him as standing by what he was originally reported as saying. Corporal Tanner, the new Commissioner of Pensions, had tried to remove Gen. James B. Coit, a brave Connecticut soldier, who was a Democrat, and Mr. Noble had overruled him. The correspondent of the *Times* asked him what this action signified, and the Secretary replied: "My order to the Pension Commissioner was only intended to prevent the removal of such a man as Gen. Coit. I am not willing to see a man that fought all through the war, as did Coit, and who carries a lot of lead in his body as a memento, asked to step down and out, even though he may be a Democrat. But I am willing and anxious to see the Democrats turned out and their places filled by good Republicans. Tanner is no more of a partisan than I am. There are about 150 Democratic special examiners who can be put out and who will make room for Republicans. That's plain enough, isn't it? I am no Mugwump nor civil-service devotee. I believe in giving the places to Republicans, whenever opportunity offers without injury to the service."

It is very likely now that the seventh State to enact a ballot-reform law will be Minnesota. The lower house of the Legislature has passed, by a practically unanimous vote, the measure known as the Keyes bill, which is a complete application of the Australian system, and very similar to the laws of Massachusetts, Indiana, and other States. There is a chance that Connecticut may be the eighth State to fall into line, but the hostility of the politicians of both parties in the Legislature is causing delay, in spite of the strong pressure of public sentiment in favor of the reform. In New York State it is amusing to observe the efforts of the Hill organs to create sentiment in support of his expected veto of the Saxton bill by printing in full Mr. Sheehan's absurd speech, in which he denounced the Australian system, and favored an American system as more worthy the confidence of the American people. The great argument in favor of the Australian system is that it is not an experimental one. It has been in successful operation for thirty years, and one of its most salutary effects has been the suppression of "dealing" at the polls, an American institution which Mr. Sheehan and his friend the Governor are most anxious not to see disturbed.

The American Federation of Labor has issued, or is about to issue, an address in favor of the eight-hour movement. The address states that there are 1,000,000 men, who would be glad to work, unemployed in the United States. These people, it says, must be supported, and "it would be much cheaper to keep them employed than to keep them in idleness." This is the doctrine we have always held in respect to the inmates of our State prisons. Whether the American Federation of Labor holds that it is cheaper to keep criminals in idleness than to keep them employed, although the contrary rule is sound as to everybody else, we do not know; but we observe that every member of the Legislature who so holds, pretends to speak in the interest and with the authority of Labor. Would it not be a happy solution of the labor problem to enlarge the penitentiaries and make them comfortable and call them asylums or retreats, and then send all the unemployed with their families there, provided they were willing to go? Of course the idea of disgrace would not attach to a person who goes to prison voluntarily and as a means of relieving the labor market. But if it is advisable on purely economical grounds to support 50,000 men in idleness in State prisons and county jails, would it not be wise to support a million in the same way? Does the mere fact that a man has committed a crime make his support at the public expense desirable in the interest of Labor, while if he had remained honest it would not be desirable?

Our correspondent from South Carolina, on another page, makes out a strong case for his State in answer to our article on "Negro Convicts"; but, in spite of his explanations, we are not yet convinced. An examination of the Governors' reports on Pardons for 1885, 1886, and 1887 shows such an apparent recklessness in dealing with human liberty on the part of all connected with the courts, that much explanation will be necessary to remove the imputation these reports cast upon the State. It is true, we do not have before us all the papers in the cases, but we are certainly justified in assuming that the Governor is satisfied of the substantial accuracy of the statements upon which he bases his pardons, and that while they may not be wholly right, they are, in the main, correct. In any case, it ought not to be possible in any community for a man to be sent to prison for life without any evidence being heard against him, especially where it is alleged that he was induced to plead guilty while in liquor; nor should a person be sent to prison for even five years for stealing ten pounds of flour or a suit of clothes. Can our correspondent point to the case of any white man receiving such a punishment? It is probably true that the reasons on which the pardon is based are not known in all cases to the juries at the trial, but it can hardly be said that justice is dispensed in a court where, as in one case in 1886, the prosecuting attorney states that he was satisfied at the trial that material evidence had been withheld. In a Northern State, a prosecuting attorney would *nol. pros.* at once such a case as that of Prince Williams; but his case is matched by that of Frank Peters, convicted of the same offence in 1887. He had lived with a woman nearly twenty years "after the custom of slavery," and, becoming alarmed at the number of prosecutions for adultery, was formally married on the advice of white friends. Nevertheless, as a woman with whom he lived as a slave was alive, he was convicted, although this woman gave testimony in his favor. Of course, this case may be susceptible of explanation, but it ought never to have been tried unless a salutary effect on the colored race was expected of it.

Our correspondent says that the statute of 1883 was passed for the special benefit of negroes, but it seems at least curious that the discretion was given to the jury and not to the judge, as in Northern States; and it is to be noted that there is no case in the report where, so far as can be seen, a jury has recommended a negro to mercy under this act, and there are cases where the failure of the jury to make such a recommendation is urged as a reason for a pardon. It may be that crime has gradually diminished among the negroes since 1876, but it is strange to find 843 negro convicts in 1888 as against 575 in 1878, and that 76 persons under twenty years of age were received at the Penitentiary in 1878 and 196 in 1887. We would do no injustice to South Carolina, but our correspondent will agree that the matter deserves further investigation. We will add that we owe to the abolition of slavery the wholesome amenability of the South to outside criticism of a disinterested and friendly kind, which is one of the most potent forces for the regeneration of that section. Since our article was written, Gov. Richardson of South Carolina, in more or less conscious deference to this opinion, has given full and free pardon to two negroes, the first persons who had ever been convicted of murder by lynching. Their victim was a white man who had fatally outraged a colored girl. We gladly record this instance of a wise clemency, which the Governor takes care shall not be misunderstood.

The British finances show a surplus of £2,586,000 during the last fiscal year. This is due principally to an improvement in the foreign trade, which shows an increase of about 5 per cent., while that of England's Continental rivals shows a decrease. The two systems of free trade and protection are thus brought into sharp contrast. England's most persevering rival is Germany, and it was thought a few years ago that the latter was making gains at the expense of the former. But the reverse has proved to be true, and there is every reason to anticipate that England's gain will be in proportion to Germany's efforts to "protect home industry." The drunkard's remedy of more drink for a failing constitution is always and everywhere demanded by the protected classes. Movements are already on foot in Germany to increase the duties on cereals, to check the increased importation of food. In France the duty on rye, the chief article of food of the peasantry, has lately been doubled, and a differential duty has been added on top of this increase in order to favor French shipping. That is, the duty on rye, formerly 15 francs per ton, is now raised to 30 francs, with 30 francs additional if the rye is grown in any country out of Europe and imported from any country in Europe. This is considered a great triumph of Protection. Everywhere except in England the forces of Government are applied with increasing rigor to the task of piling taxes on consumption, which are always taxes on the poor and mostly for the benefit of the rich. The policy of republican France is in this respect curiously like that of the old monarchy anterior to the Revolution. Restrictions upon trade and industry were the prime cause of the misery which led to that great upheaval. The Government was a corporation of rich and titled men who made laws for their own benefit. The Government of to-day is a corporation of rich and untitled men who are making laws to the same purpose. We would not affirm, however, that we are any better than France in this respect, or that our laws are preferable to hers as to restrictions on trade or means taken by Congress to tax the many for the benefit of the few.

England's Treasury surplus is to be spent in increased naval strength, and the like use and disposition will be made of any other surpluses she may have during the next five years. There will probably be borrowing in one form or another before the intended expenditure of £20,000,000 for new war ships shall have been carried out. Mr. Goschen, the Chancellor of the Exchequer, has proposed an additional tax of 1 per cent. on inheritances, and a small increase of the beer tax, but these will hardly cover the outlay within the time set for the completion of the work, unless British trade shall show a very large gain in the coming five years. The *Economist* thinks that not more than £400,000 to £500,000 increase can be looked for from this source, while it is possible that there may be none at all. Nevertheless, the intention to put the British navy on a footing of equality with the combined force of any two of the Continental Powers will be carried into effect. It is only a question of money, and England has the money, or can easily get it. And thus the surplus of this world's goods and comforts which free trade brings goes, after all, into ships, guns, and bombs. But in the present stage of civilization there seems to be no option. We have not advanced so far beyond the savage state as outward appearances would indicate. The meaning of this great expenditure for the paraphernalia of death and destruction is, that if England does not have it, some other nation may rob her, just as the ancient Vandals, Goths, and Huns robbed each other.

The English Ministry are in nearly as bad a logical plight over the convention they have concluded with the sugar-bounty gov-

ernments of the Continent as our high-tariff men in the last canvass. France, Germany, Austria, Belgium, and Holland have been paying bounties to their own sugar-producers amounting to about $45,000,000 a year. The result of this has been that the English market was constantly supplied with extraordinarily cheap sugar from abroad, to the great delight of the sugar-consumers, but to the great chagrin of the sugar-refiners. The cheap sugar, part of the cost of which was thus paid by foreigners, not only carried comfort into the households of the poor, but has developed a confectionery business which now employs nearly double the number of hands engaged in refining. But the refiners have been able to get the Government to enter into an agreement with some of the above-mentioned Powers under which England, in consideration of their stopping the bounties, undertakes to exclude sugar coming from countries which persist in paying them—that is, from France, the United States, and Brazil. Sir Thomas Farrer, the Permanent Secretary of the Board of Trade, whose attacks on this convention have been admirable specimens of economical dialectics, points out that it will deprive the British public of the benefit of the bounties —that is, raise the price of sugar to the consumer. But Baron de Worms maintains that it will not raise the price to the consumer, because the bounty, he says, went into the pockets of the producers. Sir Michael Hicks-Beach made a declaration to the same effect in the House of Commons the other day, having previously stated that one effect of the convention would be to bring into England largely increased quantities of colonial sugar. On this Mr. Gladstone took him up, and asked him how could this be if the convention would not raise the price in the English market. Sir Michael Hicks-Beach made answer that "this appeared to him to be a matter of argument in debate," which was received with "great laughter and derisive cheers." Senator Hoar and some other high-tariff orators were between the horns of just the same dilemma during our last canvass. They had to maintain, in the same breath, to the workingmen, that prices had to be kept up by the tariff in order to enable manufacturers to pay high wages, and that prices were not raised by the tariff, and therefore did not increase the cost of living; but we do not think they ever saw the joke of their argument.

There was a curious debate in the British House of Commons a week ago on the condition of the poor in the great towns. It was brought on by Mr. Broadhurst, the workingman member of the House, and all he had to say was that there was a great and regrettable drift of population into the cities, and that the poor in these places were badly lodged and fed, and that the Government should do something about it. This something was, however, simply the provision of better lodgings and the furnishing of a free lunch to the children at the public schools. There is no doubt that there is in all the English large cities a large and increasing mass of poverty, although the number of paupers in proportion to population is not nearly as great as it was forty years ago. The same complaint is made in nearly every civilized country. In the United States as well as in Europe poor people flock into the cities in regrettable numbers. But the remedy proposed by philanthropists like Mr. Broadhurst and a great many others must strike thoughtful people as little short of irrational. It is neither more nor less than to make cities more attractive to the poor—to supply better lodgings for less money to the fathers and mothers, and give the children free meals as well as free schooling, to say nothing of parks, gardens, cheap fares, and Saturday music. To offer these things to the poor and then cry out because the poor crowd into the towns is surely very absurd. The truth is, that if even half the Radical programme for the government of cities were carried out, we should very soon reach the "panem et circenses" of the Roman Empire, without having conquered provinces to draw on for the cost. To make any scheme for permanently improving the condition of the urban poor a success, it should be accompanied by some plan of keeping down the urban population. Of course this is impossible. All Socialistic schemes ignore studiously the question of population, although it lies at the root of the labor problem. They act on the street-car conductor's assumption that there is always room for a few more. The answer to the question they are constantly asking, why machinery has not done more to improve the condition of the working class, is simply that the working class pursues the machines with so many children that they cannot get very far ahead with their production.

The rules of procedure under which the French Senate is acting as a court of impeachment of Boulanger and some of his supporters, have intrusted the preparation of the indictment, or "instruction préparatoire," to a commission of nine, and they conduct the case as "managers," to use our term, at the trial. The trial is public, and is a great opportunity for the display of a kind of oratory in which Frenchmen of all classes delight. As to the mode of finding a verdict, there was considerable discussion, many being desirous of following the practice of the old Chamber of Peers under the Restoration, in which in all trials of this sort each Peer first cast a provisional or tentative vote, accompanied with a few remarks, and the final and irrevocable vote was taken subsequently. This plan was, however, rejected. There will be but one ballot, and it will be final and open—that is, in secret session, but by public utterance. What the penalty may be we do not learn, but probably anything the Senate pleases, from the guillotine to simple exile.

German politics are somewhat convulsed over a new press law which is now under consideration by a special committee of the Federal Council, and will shortly be, if it has not been already, submitted to the Reichstag. The proposed bill, by way of shutting up the Socialists, forbids all hostile discussion in the press of the "fundamental bases" of society — that is, religion, the family, and property — and all articles calculated to excite "hatred or contempt of the Government," this last provision being copied almost textually from some of Louis Napoleon's legislation after 1851. The German editors of nearly every shade of opinion are violently excited over it. They ask whether it might not be held that the mere recital of certain facts, without any comment on them, was calculated to "excite hatred and contempt of the Government"; and whether a discussion of the principle of religion, property, and family from the scientific point of view, such as Kant and Fichte indulged in, might not be construed as attacks on them. The penalties attached to the bill are very serious, the second offence rendering the journal liable to suppression, or, in other words, to the confiscation, it might be, of a valuable property. The main reliance of the press is on the National Liberals in the Reichstag, who will probably insist on some modification in the interest of scientific discussion, if of nothing else. Fancy Murat Halstead in such an atmosphere, full of double-leaded articles about not only the fundamental bases of society, but the whole structure, from garret to cellar.

The message of President Diaz to the Mexican Congress at the opening of its present session, April 1, devotes a good deal of space to the financial situation of the country. He dwells with satisfaction on the improving credit of Mexico in Europe, announces that the German syndicate are about to take the remaining $17,000,000 of the loan negotiated last year, and predicts the complete refunding of the debts of 1851 and 1886 within a short time. He does not conceal the fact that Mexico's income still keeps up its chronic habit of falling behind the expenses, and says that the national finances cannot yet be exactly called prosperous. A most encouraging proposal is that which he declares is to be carried out, viz., to cut down the army and reduce the military budget for the coming financial year by at least a million. With the cost of the army eating up more than a third of the national revenue, as it has done for years, the only wonder is that it has not known the shears long before this; though it is also a testimony to the solidification of Diaz's power, and the settled condition of the country, that he now dares to do what has not been attempted for half a generation. The President gives the customary review of domestic and foreign affairs, the story being one in general of domestic tranquillity and progress and foreign peace and friendship. The Argentine Republic is about to send a Minister to Mexico, for the first time. Japan has agreed to a treaty of commerce and friendship. A postal arrangement is to be made with Great Britain whereby small packages of merchandise can be sent through the mails; this will put English exporters on a par with our own again,

OUR NATIONAL LOTTERY.

Sixty or seventy years ago, State lotteries were thought a perfectly legitimate mode of raising money for the Government, and gambling was looked on as a harmless amusement. Within that period, however, a great change has come over the public mind. Lotteries have been prohibited in England, France, and Belgium, and in most of the States of the Union, and gambling-houses are put in nearly every civilized State in the same category with brothels, and are exposed to the full rigors of police suppression. In all the churches and in all moral and religious circles in this country and in England, the gambler shares the fate of the drunkard and debauchee as an object of social reprobation. He is treated as an unfit companion for men, and as an unfit husband for a woman, and as a man of doubtful credit and an unsafe business partner.

Now, why is this? Why do the leading Christian governments refuse any longer to raise money by lotteries, or to permit anybody else to raise it within their jurisdiction? Why have all the great public gambling establishments in Europe, except Monte Carlo, been suppressed? Why does the English statute prohibit lotteries, as "a common nuisance by which children, servants, and other unwary persons are ruined"? Why is the keeper of a gambling-house treated as a criminal of a very bad type? Why is Anthony Comstock permitted in this State to pursue the vendors of lottery tickets just as he pursues the vendors of obscene books and engravings? The reason is, that experience has shown that in the vast majority of cases the man who gambles is on the road to ruin; that, to use the illustration of J. B. Say, the French economist, the legislator who sanctions a lottery "votes a certain number of thefts and suicides"; that, as another French economist, M. Lavollée, says, "a lottery is a business based on chance, in which wealth, when acquired, is not the fruit of any labor, but is acquired only by another's ruin, and is incapable of producing anything"; that any one who wins money in gambling is apt to become incapable afterwards of close attention to any regular industry, and discards prudence, in the belief that he will be able to extricate himself from any scrape by a stroke of luck.

In saying all this, we are going over ground that is very familiar to every lawyer and moralist in the United States. No arguments on any question of public policy are more trite than the arguments against gambling. We recall them to-day simply for the purpose of asking the pastors and teachers of the country, and especially President Harrison's pastor in Indianapolis, who took leave of him the other day in church with many prayers and good wishes, to consider for a moment what difference there is, in the effect on public and private morals, between a Government lottery and that quadrennial scramble for office which the President has been superintending — has, indeed, encouraged and even invited—during the past month at Washington, and from which he is now seeking refuge in a short and undeserved vacation. A lottery fills the minds of large numbers of people with confident expectations of sudden wealth to be acquired without work. The quadrennial scramble fills probably half a million of people with the expectation of salaries to be obtained suddenly also, not by fitness for the places, but by favor, or intrigue, or luck, and makes their regular calling at their own homes, to which they were bred, and in which they are capable, seem mean and dull and distasteful. A lottery induces large numbers of people to steal, or borrow, or use their savings in a venture of uncertain issue, and pending the issue fills their lives with suspense and anxiety, and fills those dependent upon them with foreboding. The quadrennial scramble causes many thousands of persons to steal, borrow, or use their savings in going to Washington and living at hotels, in an agony of mingled hope and fear, for whole weeks, until their resources are exhausted or until the President, who has encouraged them to come there, shuts the door in their faces, and goes off to recover from the effects of their importunity. Behind them at home are tens of thousands more, who cannot afford the journey, but go through all the gambler's tortures in their own dwellings, while bombarding their Congressmen with letters and petitions. During this interval the idea becomes more and more firmly rooted in their minds that their own Government, for which so many hundred thousand men have died, is a huge gambling establishment such as Homburg used to be, in which any man by trying his luck may draw "a plum." About the effect of their operations on the efficiency of the Administration, or on the general welfare of the country, they no more concern themselves than a Monte Carlo gambler about the effects of his winnings on the resources of the bank.

It is objected to lotteries, as well as to all forms of gambling, that they harden the heart and dry up the fountains of human pity by making some people rich at the cost of others' ruin. The quadrennial scramble does just the same thing. It makes every man engaged in it as selfish and remorseless as a brigand. There is hardly one of them who is not seeking to have some other man's bread taken from him, without the smallest regard to his necessities or his feelings. In fact, the winners generally openly make merry over the misfortunes of the defeated—an indecency in which ordinary gamblers usually do not indulge. We know of a case at this moment where a man enjoying a large income from a prosperous business has been spending a month in Washington, "working" to secure the dismissal of an able, efficient officer who has been long in the service, and who is dependent on his salary, in order that he himself may get the place. His motive is and must be exactly that of a gambler—the satisfaction of winning in a game of chance something which he does not need—and he has no more pity for the faithful veteran whom he seeks to displace than "the bank" has for the youth who goes out to shoot himself after losing his all at rouge-et-noir. The gambler's passion extinguishes human sympathy as nothing else does, not even the anger of armed combat.

In fact, it is hardly extravagant to say of our national lottery what John Wesley said of slavery, that "it is the sum of all villanies." At all events it may certainly be said of it, that there is hardly any villany which it does not illustrate or exemplify. It treats us to some of the worst horrors of war in the midst of profound peace—its treachery, its deceit, its brutal selfishness, its indifference to everything but victory. We hear every week that the clergy of the United States are looking about for topics of the day which they can safely discuss in the pulpit. They ransack the newspapers and the reviews for some great social or political evil to analyze or attack. Well, here is one which seems to be peculiarly suited to their weapons, because all the church-goers in the country are more or less responsible for its existence; because hundreds of thousands of professing Christians, beginning with the President, connive at or practise it, and because it is perhaps the most debauching custom for the youth of the country which any peaceful commercial community has ever either adopted or permitted. It exists solely through the deadness of the national conscience.

MANNING AND FAIRCHILD.

The Washington correspondent of the *Times* said on Monday week:

"No decision has yet been reached by Secretary of the Treasury Windom as to how he will act upon the request of the woollen-goods manufacturers, that worsted goods may be so classified that they shall pay as high customs duties as woollen fabrics. It is quite possible that no formal decision will be made at all. None ever has been made by the Treasury Department on that point, *the present classification having been originally made by one of the collectors of customs.* It is within the power of a collector to make just such a classification of worsteds as the woollen-manufacturers are seeking; and after the new Administration has got into working order, at the New York Custom-house for example, Collector Erhardt might change the present classification when the opportunity offered."

The decision that worsteds are, in trade and commerce, unlike woollens, was of course first made by a collector of customs recognizing the nomenclature of dealers which a tariff law is supposed to use. The correctness of that decision, made more than fifty years ago by a collector, was protested against, but upheld by the Treasury in 1834, put in suit, carried to the Supreme Court, elaborately argued for the Treasury by Attorney-General Butler, decided against the Treasury in 1836, and reported in 1837 in Elliott vs. Swartwout (10 Peters Reports, 137). The question came up, under the tariff law of 1832, on *worsted* shawls. The Collector levied 50 per cent., classifying them as "manufactures of *wool*," but the importer insisted that the shawls were only liable to 10 per cent. under the phrase, "*worsted*-stuff goods, shawls," etc. The Court put its decision against the Treasury on the ground that the shawls were not a manufacture of *wool*, but of a distinct article, which was *worsted*.

If anything can be established by a judi-

cial decision, it is that worsted is not woollen. Congress can say that the two shall each pay the same tax, but it has not done so. The fundamental difference between woollen and worsted rests on the crossing and interlacing of the fibres in preparing the former, while in the latter the fibres are treated by processes bringing them into smooth parallel relationship to each other. Naturally, the Court will stand by its former decision, and will assume that Congress legislated in knowledge of it. An executive increase of rates on worsted cloths will create an enormous Custom-house refund, bearing six per cent. interest. Now let us consider what this "refund" means.

In the report of the First Auditor of the Treasury for 1888, there are six items of expenditure by the Treasury which deserve examination by taxation-reformers, tariff-reformers, surplus-reducers, reform clubs, voters of every sort, and especially Democratic voters. They are these:

Expenses of collecting customs revenue	$7,291,463 02
Detection and prevention of revenue frauds	24,021 72
Excess of deposits	4,623,674 68
Debentures and drawbacks	5,268,635 15
Duties refunded	37,917 93
Judgments satisfied	932,620 41
	$18,183,332 91

The last two items, of nearly a million of dollars, are covered by *a permanent* standing appropriation, in section 3687 of the Revised Statutes, for "duties or other money paid under protest." The appropriation is unlimited in quantity, and stands year after year. If a collector has exacted money as duties on imports, and the importer has protested and appealed against the exaction, the Secretary of the Treasury can order the money repaid out of that appropriation. That is a great and a dangerous power. There is no restraint on its exercise. The Treasury can confirm the collector's exaction, and thereby similar exactions will continue at the custom-houses till the sum is large in amount. Then it can by the Treasury be ordered to be paid back, all the money going to the importer, and none to the consumers who really paid it. If the legality of the exaction is tried in court and judgments are entered against the collectors, then the Treasury pays the principal of those judgments out of the same appropriation, and the interest out of another appropriation. The Federal laws authorize interest to be computed at the rate allowed by the State law, and to be included in the judgment, but for that an annual appropriation is needed which is hidden in the first of the above items.

The third item comes of a custom-house rule requiring an importer to deposit a sum, calculated on the face of his entry, which is held to await the final liquidation, when the excess is returned to him by a check to his order.

The fourth item explains itself.

When Secretary Manning came to the Treasury, he found some 2,300 suits pending in the Federal Court in this city for money illegally exacted, on protectionist theories, as customs taxes. He accomplished the creation of a new Federal Judge who (he intended) should do nothing else than try those suits. The sum involved therein is many millions. He continued the rates of duty which had been fixed by his predecessors, and suits went on against such exaction; but, as new questions were presented, he ordered the *lowest* rate to be levied, as became a tariff-reformer, and thereon no new suits were begun. When he died, the Treasury relapsed into its old habit, begun in protection days, of grabbing all it could clutch. During the last year nearly a million was refunded, chiefly on judgments, which shows that the illegal exactions by Maynard are in suit and undecided. Refunds thereon will come later, and are likely to come in abundance. The protectionists got what they wished when he ordered the increased taxes levied.

It is plain to see that the question presented by a custom-house protest and appeal is chiefly a *law* question, to be decided by the Department of Justice, and not by Maynard, for its true decision depends on what the Supreme Court will probably say. Maynard's opinion could be of little worth in regard to that. If the Supreme Court is likely to condemn the exaction, it should not be made. Every decision by the courts against the Treasury is evidence of bad administration and an injustice to consumers of imported articles. The Treasury loses nothing by a refund, because it only releases what it should not have exacted; but the consumer loses all, while the importer, with his claim-agent, pockets all.

Mr. Fairchild and Mr. Maynard, failing to see that as smugglers are the regulators of customs taxes, so claim-agents are the best regulators of Treasury decisions inflicting rates in doubtful cases, have, during their brief term, denounced to Congress custom-house lawyers in much the same terms as smugglers. But every one sees that had it not been for the power to bring suits, there would have been no check whatever to be exercised by the judicial power on the decisions of Fairchild and Maynard. Naval-Officer Burt, we are surprised to see by his recent letter to the *Evening Post*, advocates legislation by Congress which will in effect make the interpretation of taxing laws solely an executive question, from the decision of which the courts will be practically excluded if the protectionists have their way. What chance of justice will taxpayers have if Harrison shall appoint (as he probably would) such executive officers in the interest of protection? It is bad enough to have protectionist legislation, but even worse to have protectionist interpretation such as there has been by Maynard.

The existing system is defective, we concede, but chiefly so because customs and Treasury officers will not heed the mandate of the courts, which permits only the lowest rate of taxation in cases of ambiguity. That was Manning's rule. A disregard of the judicial mandate creates the suits, supports the Custom-house lawyers, and makes the scandal and trouble. It gives rise to the increase of taxes which has recently flourished under executive orders, to be condemned in the end by the courts, and followed, soon or late, by vast refunds, benefiting manufacturers and importers alike, but injuring consumers and taxpayers alike. Reform is needed in that branch of the customs service, and in the direction begun by Manning, Cleveland's wise and great finance minister. He clearly saw that the place in which to begin tariff reform and revenue reform was in the Treasury, and by putting a stop to the interpretation of ambiguous customs laws in the interest of protectionists. Four years of that reform would have given great relief to the country! It seems, on first sight, a contradiction to say that the interests coincide of Wanamaker the importer (if he can get a refund) and the domestic manufacturers of silk trimmings; but, nevertheless, they do coincide. What the protectionists seek is a levy of the highest rate in order to keep out foreign goods! What the Wanamakers seek is a refund!

THE USES OF A NAVY.

THE *Century Magazine* for April contains a note of warning in its editorial department against the upbuilding of "Jingoism" in this country as a consequence of increased armament. "There are," it says, "in every country, our own being no exception, newspapers and public men who are always ready to float on the crest of a wave of popular passion, no matter whither it may be driving, or on what inhospitable shore it is to break in tumultuous surf at last. The case will bring its peculiar temptations for the United States, for the navy is just that branch of the service for which our people have a traditional weakness, and on which they will spend the public money with least complaint." The *Century* does not take the absurd position, that we ought to expose ourselves to attack merely because the possession of an adequate naval force might lead us into wars which would otherwise be avoided. It points out both the dangers of too little and of too much armament, and expresses the hope that proper provision for defence may not be made "the means for transferring the once great neutral republic to the list of quasi-belligerents, who now give an added stigma to the term civilization by their system of permanent armament."

The question is a serious one indeed. It would seem to be capable of solution in part by directing our efforts first and chiefly to means for making ourselves secure at home, rather than to steps for making ourselves formidable abroad. It is doubtful if we could within twenty years put ourselves in a position to cope with the foremost naval Powers of Europe. But we could put our chief harbors in a state of defence, with the aid of a small but thoroughly modern navy, in much less time. We could not attack other nations with our fortifications, but we could ward off their attacks. The chance of our being attacked is very small in any case, and the chance of our being attacked by second or third-rate Powers, which are most commonly employed as bugbears to urge us on to large naval expendi-

ture, is almost nothing. Nevertheless, we must be prepared for emergencies, but in such manner (if such a thing be possible) as not to stimulate an aggressive spirit which may finally put us in the company of the great war Powers of the globe, whose populations are ground between the upper and the nether millstones of war taxes and personal military service.

The Chicago *Tribune* finds a reason for a large navy in the fact that we have no foreign commerce to speak of. It has been commonly held and believed that merchant ships and foreign trade precede and, in some sense, necessitate the building of war ships. The view of our Chicago contemporary is the opposite of this:

"It is the control of the seas," it says, "which gives the control of the commerce of the world. The fact that it was Carthaginian or Roman or English war ships that ruled the ocean, settled the question who stood at the head of commercial nations. It is the power to protect the merchantman which determines in the long run who shall have the most merchantmen. The United States has at present no ships with which to protect and no vessels to be protected. Therefore, the foreign policy of the present Administration is, first, war ships."

It may be true in a semi-barbarous age, when might makes right, and when commerce is in large part spoliation and piracy, that a naval force is a prerequisite of successful foreign trade. But it is not true in the present age of the world. If we had under our flag to-day the combined navies of England and France, we should not have one ton more of foreign commerce than we now have. No American ship is prevented from getting a cargo because of a lack of ironclads to guard her. No builder is prevented from constructing ships, no merchant is prevented from executing orders for goods for the uttermost parts of the earth by reason of a shortage of naval force. No convoys of merchant fleets are ever heard of nowadays. Nobody thinks of battering open foreign markets with cannon. Little Norway and little Holland find no drawbacks to their commerce in the want of a naval force. Nor does Italy or Russia find new or better markets in the augmentation of its navy. If the Chicago *Tribune's* theory were correct, France ought to have gained largely upon England in the race for commercial supremacy in recent years, because she has gained largely in naval strength. But the very reverse has been true. In spite of naval expenditure and of heavy subsidies, French commerce has declined, while English commerce shows the same relative gain that it had in former years. The reason is not far to seek. Naval expenditure and subsidies have to be paid for by taxation which bears upon all the national industries, commerce included. Moreover, hostile tariffs which impose unnecessary burdens on imports are in effect burdens on exports, diminishing the amount of pay that a nation gets for the goods she sells to foreigners. France burdens herself heavily in this way, as we do also. To suppose that we can offset this loss by spending a lot of money for a navy is a very odd conceit, and one which we should not expect to win popularity in districts a thousand miles from the seaboard.

GOVERNMENTAL LAWLESSNESS.

One passage in Mr. Bryce's book has attracted a good deal of attention from political philosophers abroad, though comparatively little from Americans, and yet it touches one of the most important problems in our political situation. He is inquiring how the machinery of State government is made to work when the legislators are indifferent to their public obligations, and have not enough private reputation to make them sensible to shame—that is to say, how is a State Constitution to be carried out if the Governor and Legislature do not choose to obey it? This is, of course, a question which has not greatly troubled publicists hitherto, because in all political discussions the willingness of political communities to obey their organic law has been taken for granted. The successful working of the Federal Constitution, for instance, depends on the willingness of the States to elect Senators and Representatives, and on the willingness of the Senators and Representatives to meet, and debate, and pass laws, and vote appropriations, and confirm nominations. What would happen if there were a refusal in any of these cases, nobody knows, and nobody has seriously considered. The contingency seems too remote and improbable for discussion. If you mention it to anybody, he dismisses it as an academical question, or says: "Oh, that would be revolution; I will not consider what I would do in case of revolution, until I am compelled. Life is too short for such speculations."

This very thing, however, happens in some of the States, and when Mr. Bryce asks for the remedy, nobody is able to tell him. When he reads the Constitution of this State, for instance, directing the Legislature to enact certain laws, and learns that the Legislature totally disregards these directions, or that, if it passes the required laws, the Governor vetoes them, and inquires what we do in such cases to make the organic law respected, nobody can answer him. On this he remarks:

"What the legislatures of the worst States show is not merely the need for the existence of a sound public opinion—for such a public opinion exists—but the need for methods by which it can be brought into efficient action upon representatives who, if they are left to themselves, and are not individually persons with a sense of honor and a character to lose, will be at least as bad in public life as they are in private."

To come down to concrete illustrations. The term of certain State officers is fixed by law. The Constitution says that, when there is a vacancy in certain offices, it shall be filled by the Governor's nominating and the Senate's confirming a candidate for the place. The Governor has nominated persons to fill such vacancies in this State, but the Senate has steadily refused to confirm any of his nominations, in order that the actual incumbent might hold over indefinitely. Under this revolutionary proceeding, "Tom" Platt held over as Quarantine Commissioner five years, and the present Health Officer, Dr. William M. Smith, was appointed for a term of two years, in 1880, and has held over until now, and is actually in office because the Senate refused to do its constitutional duty by confirming the Governor's nominations.

The Constitution provides that in 1866, and every twenty years thereafter, the question, "Shall there be a convention to revise the Constitution and amend the same?" shall be submitted to the people; and that, if the vote be favorable to a convention, "the Legislature at its next session shall provide by law for the election of delegates." The question was submitted in 1886; was answered in the affirmative. In 1887 the Legislature passed an act providing for a Convention, but the Governor vetoed it, on the ground that the act was not, in his opinion, the kind of act the people wanted. Consequently, the direction of the Constitution remains unexecuted and the demand of the people unsatisfied.

The Constitution provides "that an enumeration of the inhabitants of the State shall be taken in 1855, and at the end of every ten years thereafter." The Legislature passed an act for this purpose in 1885, which was copied literally, except as to dates, from previous census bills which former Democratic Governors had signed. Gov. Hill vetoed it, because it was not the kind of bill he liked, and called an extra session of the Legislature to pass a bill of his own; but the Legislature refused to pass it, because it was not the kind of bill they liked. Consequently, the census which ought to have been made four years ago has not been made yet.

Has any one been punished for this neglect of duty? No one. No member of the Legislature who was successful in getting a party nomination has been defeated or discredited for helping officials to hold over, and Gov. Hill has been reëlected in spite of his vetoes. In fact, nobody has been in any manner called to account for disregarding the Constitution and following his own whims.

What, then, is to be done about it, we do not know. We know that the public is too busy to be much interested in the matter, and has gradually lost the habit of agitation. The old "indignation meeting," which used to play so prominent and useful a part in American politics, is now hardly ever held. The old lecturer who used to keep people stirred up about current questions is dead, or old, or silent. The pamphleteer never gets outside colleges and learned societies. The business of looking after Legislatures and Governors has been wholly absorbed by the daily press, and the daily press not only shrinks more and more from the discussion of serious topics, but stands by its party, right or wrong. We have no solution to offer. We are simply describing the situation. But this we do know, that the tendency to regard the distribution of spoils as the chief business of men high in office, and everything else subordinate, subsidiary, and comparatively insignificant, grows apace, and that whenever a remedy begins to be sought for, it will probably be found in that direction.

MICHEL EUGÈNE CHEVREUL.

The death of Chevreul, at the age of nearly one hundred and three years, is the first instance of a man so well known in the intellectual field attaining so great an age. Notwith-

standing the frequency of reports of deaths at much greater ages than this, it may be questioned whether we have well-authenticated evidence that any man has ever lived much longer than Chevreul. In very few of the reported cases of much greater longevity is the fact well enough established to convince the sceptic; and the stories of Jenkins and Parr are now, by consent of those best able to judge, regarded as entirely wanting in proof. In comparing Chevreul with other well-known centenarians, we recall Fontenelle, who died one month before completing his century, Montefiore, and Holyoke, who did not add one year to the others, and Canon Beadon, who fell six months short of completing his one hundred and second year. The years of Chevreul's working activity are even more phenomenal than those of his life. His first published investigation dates from 1806; his last contribution to the Academy of Sciences was made on May 22, 1888. Eighty-two years of work after reaching maturity is something for which no precedent probably exists. The honor of foreign membership of the Royal Society of London generally comes to a scientific investigator only after the meridian of life, as the reward of long and distinguished labors. Yet Chevreul has enjoyed it since John Quincy Adams was President of the United States. His work on the harmony of colors will be remembered by old men as a book familiar to them in youth, whose author they have long regarded as belonging to a former generation. We do not know that he exhibited any marked precocity; yet the publication of an important work at the age of twenty, and the attainment of foreign membership of the Royal Society at the age of forty, show that neither slow development nor leisurely habits could have been characteristic of his earlier years.

The case of Chevreul strengthens the general conclusion drawn from other instances of the kind, that great longevity is not associated with anything unusual in constitution or habits of life, unless it be good health. The writer of this notice first made the French chemist's acquaintance in 1871, when he was in his eighty-fifth year. Though what we call "well preserved," he showed no marks of an unusually vigorous constitution. His stature was slightly above the average, and his temperament, if it deviated at all from neutrality, was what Cullen and his predecessors would have called the sanguineous, tending to the development of fat rather than of bone or muscle. It needed only a glance to show that he had not recently been a hard walker or a hard rider. At that time Canon Beadon could still hunt, though nine years older than Chevreul. Yet the latter was not physically inactive. He almost never missed a meeting of the Academy of Sciences up to the age of a hundred, unless of late years, when kept at home by bad weather. Considering his nationality, his most noteworthy characteristic was total abstention from wine—not on the score of health or temperance, but simply because he never liked it.

The most interesting question suggested by such a life is not how long a man can live, but how long he can retain his faculties sufficiently to make life worth living. We have already cited evidence that Chevreul followed the discussions in the Academy with keen interest past his hundredth year. So far as we know, his sight and hearing remained unimpaired to the last. A medical examination at the age of ninety-six showed him to be still free from any disorder. Naturally his mind lost its flexibility in his later years, and the reader may draw his own conclusions from an incident occurring when he was eighty-four. About the beginning of 1871, he published a solemn statement of the bombardment of the Jardin des Plantes by the forces of King William and Chancellor Bismarck, and three months later the writer found him still in a state of intense indignation at the act. Being pressed for the reason why a Power which undoubtedly appreciated scientific institutions should be guilty of such vandalism, he naïvely replied that the authorities had used the Jardin as a safe place to store some explosives they did not want exposed to shells, and he supposed the Prussians had found it out. In his declining years his mind did not revert to its earliest work, as one might suppose, but to that of his middle age. The contrast of colors seemed to be the principal subject of his lucubrations, and it was treated in a way that showed a loss of mental grasp. Possibly the same thing might be said of certain philosophic views upon the progress of the sciences and kindred subjects, did we not know that an apparent lack of clear thinking in such a case may arise from a failure on the part of the reader to apprehend exactly the meaning of the writer. But whatever the decay to which his productive and thinking powers may have been subject, it did not detract either from his own enjoyment of life or from the interest which all who knew him felt in the society of so genial a man.

His scientific work is so familiar to all interested in it that little need be said of it. His field might be called industrial and animal chemistry, and it was by his work as a pioneer in this field that he won his great reputation. His researches in animal fats formed the basis of what has since become one of the great industries of our time. Called to the superintendence of the great manufactory of tapestry of the Gobelins, he applied himself to the thorough study of the art of dyeing and of the theory of the harmony and contrast of colors. He devised the "chromatic scale" in which the colors of the spectrum are arranged in a circle, the violet of the upper end of the spectrum merging into the red of the lower end. His prominent characteristics seem to have been the industry and sagacity with which he set about the investigation of whatever fell in his way, and his thoroughness in going to the bottom of it, rather than in the creative genius of a master mind.

CANOVA.

BASSANO, September 18, 1888.

FOR a place only three hours from Venice by railway, and only eleven from Trent by diligence or carriage through the picturesque Canale di Brenta and the Val Sugana, Bassano seems much neglected by the summer traveller. Yet there is an excellent inn of the old quiet kind, clean and well kept, with the rusty coats-of-arms marking the passage of the Grand Duke of Tuscany, the Duke of Parma, the Count of Chambord, and the Prince of Hohenzollern. The squares and streets are full of curious antique houses, covered in parts with remnants of ancient frescoes. The art of etching and engraving once thrived there, and good examples of master works are still to be picked up. In the sacristy of St. John the Baptist there may be seen a very beautiful and equally interesting high-relief in terracotta, ascribed to Luca della Robbia, but as different from any of the works of that school as it is from the colored terracotta groups of Begarelli and others at Modena. It represents the baptism of Christ, with four life-sized figures and five small angels in attendance. The modelling and expression are admirable, and the figures, colored in subdued tones, stand out from a painted background representing such a landscape as may be seen all about Bassano. The Museum has an excellent series of pictures of the Da Ponte family and others; engravings, autographs, casts and models of the works of Canova, and a large collection of his letters, besides the remarkable herbaria of Montini, Brocchi, and Parolini. The splendid garden of Parolini, with its magnificent cedars of Lebanon and groups of pines from Mount Ida, named, after him, *Pinus Parolinii*, is still kept in excellent order by his descendants.

After all, the great charm of Bassano is its situation. George Sand, writing in the spring of 1834, said:

"I recommend to you the Café della Fosse as one of the best fortunes that can fall to the lot of the traveller tired of the classic masterpieces of Italy. . . . The country was not yet in all its splendor, the meadows being of a languishing green tending towards yellow, and the leaves had only begun to bud on the trees. But the almond and peach trees in bloom were mingling here and there their pink and white garlands with the sombre masses of the cypresses. In the midst of this immense garden the Brenta ran rapidly and silently over its sandy bed between those two wide banks that it tears from the bosom of the Alps, and with which it strews the plain in its days of wrath. A semicircle of fertile hills, covered with those long branches of knotty vine which hang from all the trees of Venetia, made a first frame to the picture, and the snowy mountains sparkling in the first rays of the sun formed a second border further on, which stood out like a silver silhouette against the solid blue of the air."

The café, which occupies the site of an old loggia in the walls, built for the sake of the view in 1504, still exists, but the mouldering red-brown walls and turrets, covered with creepers reaching to the moat below, have on one side been torn down to make room for an unfinished, treeless promenade, and the lover of landscape would do better to see the same view—although somewhat more restricted—from the balcony of the Canonica.

From Bassano one may make a pleasant day's excursion by driving along the hills to Possagno, the birthplace of Canova, then down a wooded valley to Asolo, which is still proud of its memories of Catherine Cornaro, Queen of Cyprus, and of Bembo, and perhaps go further on to Maser, the celebrated villa of the Barbaro family, built by Palladio and decorated by Paul Veronese. The landscape is such as one sees in so many old Venetian pictures—blue, rounded, bossy hills, sometimes covered with green meadow, and sometimes wooded, with abundance of pools and sparkling streams, and in the distance the high, bare, ragged, and often snow-covered mountains. When you have gone scarcely three miles from Bassano, you come to the splendid Villa Corner, now Mocenigo, which, in its many vicissitudes, has seen this landscape in much less peaceful times, for here in 1796 were the headquarters of Prince Hohenzollern, and four regiments of Neapolitan cavalry were encamped in the neighboring meadows. These were occupied again in 1866 by the division of General Medici. A little further on is a group of round hills with hamlets scattered among them, described by Dante, though not mentioned by name:

> "Within that region of the land depraved
> Of Italy, that lies between Rialto
> And fountain-heads of Brenta and Piava,
> Rises a hill and mounts not very high,
> Wherefrom descended formerly a torch
> That made upon that region great assault."

This is Romano, the birthplace of the tyrant Ezzolino, to whose cruelty and prowess the monuments of Bassano, Padua, and other towns still bear witness. At Crespano, a little further on, there is to be found one of those good li-

braries which are not uncommon in small Italian towns. The Latinist Pietro Canal, a professor at Padua, was a native of Crespano, and left to his birthplace his fine collection of books and manuscripts. To store these his brother has erected a suitable building open to the public. The amiable abbé who is the librarian, showed me with pride the whole library: a large number of early and later very rare printed books; a rich collection of Greek and Latin classics; a large library of Italian literature which originally belonged to Luigi Carrer, and had been continued by Canal, including an excellent Dante collection; and one of the richest existing collections of what is the specialty of Italian libraries, the *Testa della lingua*, or books cited by the Academia della Crusca as specimens of pure Italian. Here there are only about twenty works lacking; but there are duplicates of some of the rarer books and even earlier editions than those cited by the Academy. The very large musical library is in some respects richer in manuscripts than those of Venice. Naturally there is a large hall devoted to engravings of the works of Canova, copies of some of his statues, and objects which belonged to him, including table services given him by Napoleon, the Countess of Albany, and others; for Crespano was the birthplace of Canova's mother, and she went back there to live after her second marriage.

The small village of Possagno, straggling along the gentle slope of the hills, is dominated by the immense rotunda of the church, or *tempio*, to the construction of which Canova devoted the later years of his life and much of his fortune. It was not finished until eight years after his death, and he had been unable to execute the sculptures with which he intended to decorate it. His half-brother, the Bishop Sartori-Canova, thinking that sufficient had already been spent on the building, put, in place of the projected statues, gigantic frescoes of the Apostles which are horrible and grotesque. Otherwise there are several good pictures, and one which is interesting as being the work of Canova himself — representing the body of Christ after being taken from the cross—of which it may be said that it is not so bad as might have been expected. It was one of Canova's weaknesses to imagine that he was as clever with his brush as with his chisel. On the left of the church, opposite the group of the Pietà, is the simple but elegant monument (designed by Canova himself for another man) that contains the bodies of Canova and his brother, placed there in 1830 when the church was finished. The tombs at Rome and Venice are merely cenotaphs. On his first resting-place in the old church was the simple inscription, "Hic Canova"; but on this the Bishop put: "John B. Episcopus Myndensis Ant. Canovæ Fratri dulcissimo et sibi vivens p. c." Coming out into the Doric portico, one looks southward over the splendid prospect to the hills of Asolo. At times one seems to see the shimmer of the Venetian lagoons, which are perfectly visible from the hills behind and from the top of the church. In front, at the end of the straight hot road, is Canova's birthplace; and next to it stands the museum founded by the family, which contains plaster casts of nearly all his works, and very many of the original models used by the workmen and Canova himself for cutting the marble statues. Some of these still bear the pencil dots and black-headed tacks for the guidance of the workmen—a process which, it is claimed, was invented by Canova himself.

The effect produced—on me at least—by seeing in one building these 194 different pieces of sculpture, added to what I had already seen at Venice and elsewhere, was distinctly to raise and enhance my opinion of Canova's genius and talent. The Thorwaldsen Museum at Copenhagen did not give me a similar feeling. George Sand seemed to think that he had taken all his models from the lovely youth of Possagno; but on the morning when she wrote she had seen some one who particularly pleased her. Hawthorne lays some stress on a rash statement of Hiram Powers that Canova modelled every face after his own; but an artistic judgment of Powers is of course hardly worth mentioning, especially when transmitted by Hawthorne. Neither of these statements is true. In looking, not so much at the statues of Canova as at his drawings and studies—of which over 1,700 are preserved in the museum at Bassano—it is noticeable that his great delight was in the nude figure, and that the head is sometimes omitted and generally drawn in only feebly and conventionally, with slight attempt at indicating expression. So far as is known, Canova never drew or modelled from more than a single nude figure at Possagno—and that with the greatest difficulty, and with much severe criticism from the rustic population.

The most hasty observer cannot but be struck with the constant evidences of Canova's application and perseverance. He devoted his whole lifetime to the study of art, and not merely to perfecting himself in his own art, though all his studies helped to that end. Neither his eyes nor his hands were ever idle. When a boy in Venice, when a youth in Rome, when travelling abroad in later life, he not only made careful studies of bas-reliefs and statues, but in his pocket note-book was constantly sketching the people whom he met, noting any little peculiarity of movement or grace of attitude, as well as bits of architecture which were in any way suggestive to his mind. For some of his larger monuments there are many sketches of different grouping and on different scales. Canova was not a sculptor simply because he had the knack of modelling in clay, like so many nowadays. Quatremère de Quincy urged him one day to take a greater number of workmen and students, and to content himself with modelling, leaving his work to be put into bronze or marble by other hands; telling him that he could thus make much more money. Canova replied that he wished to be a sculptor and not a manufacturer of statues, and that he preferred to leave fewer works provided they were better. When in Rome he rarely went to bed without visiting his studio with a small lamp, which he placed in various positions near the statue he would then be at work at; without carefully observing the outlines and contours by this illumination (so different from that of day) and giving a little touch of the file wherever it seemed necessary. Even the disease which caused his death was originally produced by too hard and prolonged work on the monuments of Clements XIII. and XIV. in St. Peter's. His pressing the borer against his chest for so many hours at a time brought about cancerous affection of the liver.

It was well that Canova should follow the excellent customs of study and work practised by the great artists of the Renaissance, for never since that age has a sculptor had the same opportunity for the world to admire, or at least to purchase, his productions. Living at a time when the world cared for the arts as well as for display, a period traversed by the French Revolution and the Napoleonic Empire, he had unusual facilities for making the personal acquaintance of the rulers of the world. A protégé of the Popes, he was favored and admired by Napoleon, and yet his position was none the worse on the return of Pius VII. to Rome. Besides this, the charm of his character and manner was such, his innate goodness was so plainly visible, that he made friends—and good, prudent, and powerful ones—wherever he went.

When quite young, Canova had been intimate in Rome with the engraver Volpato (almost a countryman, for he had been born at Bassano), and had been persuaded to become engaged to one of his daughters; she, however, jilted him for a young Pole, and subsequently married the engraver Raphael Morghen. After that, Canova had no more time for love or marriage, and his simple life was for many years regulated by his nurse and housekeeper, Luigia Giuli, an interesting bust of whom, by Canova's comrade and lifelong friend, Antonio d'Este, is to be seen in the museum at Ravenna. Canova's affections were henceforth given to his friends, and his leisure to serving the interests of art, whether as Director of the Vatican Museum, President of the Academy of St. Luke, commissioner to restore to Italy the works of art carried away by the French, or simply by his efforts, his purse, and his influence in favor of young artists who were in any way unfortunate. Not a shadow of jealousy or envy ever seems to have crossed his heart; and among particular acts may be mentioned what he did to relieve and to release the young Spanish artists imprisoned by General Miollis in the Castle of St. Angelo, among whom was Madrazo (the father), and to prevent the expulsion from Rome of the German artists, including Rauch, and Thorwaldsen, who was classed with them.

The episode in Canova's life which is probably the most interesting to the general public is his share in restoring to Italy the works of art carried off by Napoleon. For this he was naturally marked out. Yet it was not with pleasure that he received the orders of Cardinal Consalvi, for he had to leave Rome, to quit his simple life, and be subjected—as he anticipated, and as proved to be the case—to a thousand annoyances. After the first Treaty of Paris in 1814, the Allies had respected the Louvre and the French provincial museums, and had asked only for those works of art belonging to their respective countries which were simply kept in the storehouses. After the Hundred Days and the necessity of renewed military exertions, they insisted on punishing France, not only by military contributions, but by depriving her of the spoil of the war. The most bitter were England and Prussia; and some French writers are absurd enough to suppose that the inspiring cause of the English effort to restore the works of art came from dislike to having their own museums rivalled and surpassed, and the hope of buying up the pictures and statues at a cheap rate when France had been deprived of them. One proof of this, in French eyes, was that the Parthenon had been despoiled to procure the Elgin marbles which went to the British Museum. The Emperor Alexander sympathized with the French, for no objects of art had come from Russia, and he found it beautiful and convenient that all the artistic treasures of the world should be collected in one great museum. Unquestionably the Louvre must have been splendid in those days; but unfortunately it was so magnificent that no traveller or diarist of the time has given us an adequate description of it, and we are left to the study of catalogues and monographs to form for ourselves the idea of what it must have been. It is easy to appreciate the feelings of those who regretted the breaking up of such a magnificent collection;

but lovers of art felt then, as now, that it was unfair to the various countries of Europe that they should be deprived of art treasures which had been their pride for centuries. They felt, also, that it was unsafe to collect all the treasures of the world under a single roof; and for these fears the dangers to which the Louvre has been since exposed are a sufficient justification.

The French offered a passive resistance—if they had dared, they would have offered active opposition—to what they called the "spoliation of France." Louis XVIII. was indignant but powerless. Denon, the Director of the Louvre, who had been the chief agent of Napoleon in collecting the museum, resisted sufficiently to compel a show of force. Had it not been for what the French call the "brutality" of the Prussian soldiers, who offered to break down the doors, and for the smoother but equally persistent efforts of Sir William Hamilton, the French would perhaps have kept the gallery. Canova was the agent only of the Papal Government, but he was also commissioned to pursue the claims of the Albani, Braschi, and other families whose collections had been pillaged; and he gave his influence in aid of the agents of the other Italian States. He was met at the outset by the French claim that most of these works of art had been freely ceded by the Pope in the Treaty of Tolentino; but he fortunately found that this treaty had been denounced by the French themselves. Although he felt obliged to yield to King Louis XVIII. most of the pictures and sculptures which were kept in his private apartments, and although many things could not be found, having strayed into private hands, he was able to restore to Italy the greater part of what had been taken from her. Owing to his want of funds, the English Government on two occasions advanced the sum of 100,000 francs each, to pay the expenses of packing and transport. Only one of the great Italian pictures still remains in the Louvre—the "Marriage at Cana," by Paul Veronese—as it was thought it would have to be cut to pieces and irremediably injured in the transport to Venice.

One can appreciate still more the feelings of Denon and his subordinates at the Louvre when it came to the turn of the provincial museums to disgorge. In order to fill the gaps in the galleries at Paris, it was necessary to recall some of the presents made at various times from the overflowing collections. The provincial museums not only objected to this, but protested and complained. Their pictures had sometimes to be taken almost by force, and they demanded compensation.

Canova had at one time a commission to make a colossal statue of Napoleon, which is a really splendid work of art. But the original had never been publicly set up in Paris, as, on account of its nudity, the Emperor feared the jests that would be levelled against him. In the distribution of spoils this was given to the Duke of Wellington, and still exists in the possession of his descendants. The replica of it in bronze stands in the court of the Brera gallery at Milan, and a cast of it in the Palazzo Bonaparte at Rome. The reception at Venice of the objects taken thence is told in the recently published letters of Cicognara. Canova had proposed that the bronze horses, brought originally from Constantinople, should be placed on each side of the ducal palace, looking towards San Giorgio, but it was decided to restore them to their former position above the porch of San Marco. It was a great festa, with music, cannon, and bells, when, in the presence of the Austrian Emperor and his court, the horses were once more hoisted into their place. The mechanical arrangement was so perfect that the operation lasted but a very short time, after the fleet of gondolas had towed to the landing-place the raft containing the group, which had been temporarily deposited at San Giorgio.

The part played by Canova in all this business was for a long time not forgotten in France. When, after Canova's death, Cicognara undertook to get up an international subscription for his monument, the banking-house of Delessert refused to accept subscriptions; and even Louis Philippe—then Duc d'Orléans—wrote that he would have been most happy to subscribe, "but it is notorious that in 1815 Canova quitted his chisel in order to come to Paris to take charge in the devastation of that museum the loss of which France deplores, and the dispersion of which friends of the fine arts in all countries must regret. This sad page of his history prevents any Frenchman from adding his name to the list of those who are erecting this monument."

It may not be generally remembered that, at a time when the different countries of Europe were in rivalry for possession of works by Canova, one of his statues was brought to the United States. It was a seated statue of Washington ordered by the State of North Carolina. Canova interested himself greatly in the work; as a republican born he admired the character of Washington, and he endeavored to increase and enlighten these feelings by reading what lives of Washington were available, and the whole of Botta's history of the American Revolution. The model was executed in 1818. The statue was finished soon afterwards, and was unveiled with some pomp and ceremonial in the State-house at Raleigh. Unfortunately, it perished in the fire which destroyed that building in 1831. The statue represented Washington seated in the armor of a Roman general, with his helmet and sword on the ground by his side, engaged in writing on a tablet what was apparently his Farewell Address, or the resignation of his commission. The likeness was, of course, made up from copies of portraits, and the statue cannot be called one of Canova's most successful works; but it is on the whole more interesting than that of Houdon and than several made since. Various engravings of it are to be found in the different editions of Canova's complete works, and the original model of it—with nail-heads, pencil marks, and all—still exists in the museum at Possagno. The correspondence on the subject is in the library at Bassano, but there has been no time to examine it.

Nothing will be easier, in one sense, than to obtain a replica of this statue of Washington almost as perfect as that finished by Canova's own hands; and it will be well worth reproducing, even if only as an historical souvenir—either by the order of the State of North Carolina, or by some wealthy Northerner in gratitude for the restoration of his health by the charming climate of Asheville. It has been ascertained on inquiry that the statue could be reproduced by any of the best sculptors of Venice, and set up at Raleigh for a sum which would not exceed six or seven thousand dollars. It would be necessary, however, to intrust the work to an Italian—and better, a Venetian—sculptor: partly because there might be difficulties in obtaining permission to use the model, and partly because it might be necessary to do the work at Possagno itself. Besides this, it is to be feared that some of the so-called American sculptors in Italy would charge three or four times as much, to have the work done by Italians without touching it with one finger themselves, and then pocket the difference of price.

E. S.

Correspondence.

NEGRO CONVICTS IN SOUTH CAROLINA.

To the Editor of The Nation:

Sir: In an editorial of the 4th inst., entitled "Negro Convicts in South Carolina," you bring one of the severest indictments against that unfortunate State that I remember ever to have read. Had this article appeared in one of those strongly partisan newspapers utterly blinded by sectional prejudice, it would have received very little attention. But the *Nation* has been so uniformly just towards the South, and preserves so judicial a tone on all subjects, that the charge which you make in the editorial referred to is doubly damaging. If facts are as you describe them, then indeed ours is "a state of things hardly credible in a civilized community." But you are well aware that South Carolina *is* a civilized community, and such knowledge ought to have put you on your guard against the mistakes into which you have fallen. As I feel sure that you meant no injustice, and that you desire to get at the truth, permit me to call your attention to the facts in the case.

"It is sufficiently startling," you remark, "to be told that of the 894 convicts in the South Carolina penitentiary 843 are colored, and it savors a bit of slavery to find that of the 70 negroes who were subjects of executive clemency during the year, 25 were serving life sentences and 13 others terms of imprisonment of ten or more years."

It should not be a startling fact that, in every community, the great majority of criminals come from the ranks of the poor and ignorant and thriftless. This is as true of New York as it is of South Carolina. Let it never be forgotten that for eleven years (1865–1876) the negroes of South Carolina had a thorough education in crime. During that period bad white men—the great majority of them emissaries from the North—encouraged the negroes in every form of incendiarism and theft. They were taught that it was not wrong to steal from their former masters—that it was, in reality, not stealing, but taking what properly belonged to them. For the ignorance and the low moral tone of the negro, doubtless slavery is largely responsible; and we of the South are willing to bear our share of responsibility for this state of things; but it is certain that the complete demoralization of the negro during the carpet-bag reign was due to the pernicious teaching of these adventurers from the North.

You can now understand why it was absolutely necessary for the Democrats, immediately on coming into power, to pass severe laws against burglary and arson. These were the crimes that were ruining the State. They struck at the very foundation of the social fabric. Industry was paralyzed when its fruits might at any time be consumed by the flames or be borne away by the burglar. It was necessary, too, that these laws should be enforced not only against adults, but against youths of both sexes, sent out on the mission of destruction just because it was presumed that the punishment inflicted on them would be slight.

This discipline, severe but indispensable, had its desired effect. After 1876 crime gradually diminished in the State. By 1883 there was such a moral improvement in the negro race that in that year the law was considerably relaxed, and the punishments were made much

lighter. It is to this relaxation that you refer when you say:

"The method by which the administration of the law is kept impartial to all, white and black alike, is ingenious. The statute punishing burglary, for instance, prescribes punishment for life as a penalty, but with an important proviso that if the jury recommend the prisoner to mercy, the punishment shall be reduced to imprisonment for not less than five years. This allows juries to recommend white offenders to mercy, while the negroes suffer the full penalty of the law."

On the contrary, I am assured by the present Governor of the State that the statute was passed for the special benefit of the negroes. The seven years (1876-1883) of discipline under the severer laws had so reduced the crimes of burglary and arson, that it was felt that there might safely be a relaxation of the law and a mitigation of the punishment. The statute which you suggest as made to shield white offenders, must, like most other statutes, be studied historically to be understood; and when so studied, it will be found to bear no such interpretation as you put upon it.

Another general remark needs to be made. You mention cases of persons sentenced to long terms of imprisonment when the articles stolen by the burglar were few and of small worth. But this is not a fair presentation of the case. If a burglar breaks into a house with the view of stealing valuable property, and perhaps of committing murder, if necessary to his purpose—if such a burglar escapes with not a dollar's worth of property, he is just as guilty as if he had taken all he intended to take. In a state of things in which the laws must be severe and rigidly enforced, it will no doubt sometimes happen that the punishment will be too severe; but in all the cases mentioned, I venture to say it will be found that it was the character of the crime, not the amount of property stolen, that determined the nature and amount of the punishment inflicted.

I cannot take up all the cases you have adduced; you would hardly allow me the space for this. It will be better to give such a full statement of two or three of them as will show their real character.

The case of Prince Williams is an interesting one. Your statement of it is as follows:

"Prince Williams, while a slave, had a wife, although no slave marriage was recognized by the law, and this wife seems to have disappeared, *perhaps sold into slavery*. At any rate, Prince married again in 1878, and, after living with his wife for ten years, was prosecuted for bigamy, slave marriages having been validated by the Legislature. Immediately on his conviction the prosecuting attorney had the grace to recommend his pardon, stating that the main object of the prosecution was to vindicate the law on account of the salutary effect upon the people of that race."

The expression, "perhaps sold into slavery," which I have italicised, insignificant as it may appear, really gives a false turn to the whole statement. It implies that a negro whose wife had been sold into slavery before or during the war, and who, after waiting in vain for many years for the reappearance of his wife, marries again, is prosecuted and convicted as a criminal; and this, too, although his former marriage was not a legal marriage. If the laws of South Carolina permitted a prosecution and conviction under such circumstances, they would indeed betray "a state of things hardly credible in a civilized community." Here is the statement of the case made by an attorney acquainted with all the facts, in response to the Governor's request for information:

"Prince Williams, an old colored man, was convicted at the February term of our court of bigamy. It appeared from the evidence that Prince married Louisa during slavery and lived with her up to 1873, when Prince was told that his slave marriage was not legal, whereupon he asked his wife, Louisa, to marry him according to law, and validate what he supposed to be an illegal marriage. Louisa refused, and said that she did not wish to bind herself to Prince. A separation took place, and Prince took another wife in 1878. Wife number one lived within a few hundred yards of Prince and wife number two for the past ten years, and not until recently thought of charging him with bigamy; and I am satisfied that the prosecution was brought to revenge herself of an injury in another matter before the Trial Justice Court. Everybody who heard the case thought Prince should be discharged, the evidence showing that he had acted in ignorance of the law, and had done everything in his power to live with wife number one before he left and took wife number two. The judge, solicitor, and jurors join me in asking a pardon for Prince, and I trust the same may be granted by your Excellency. Judge Aldrich directed the sheriff not to send Prince to the penitentiary until you could be heard from. Your early attention will be very acceptable to Prince and your friend, M. P. Howell."

I may add that the law validating slave marriages was passed in 1872, and that it applied only to cases in which the parties were living together at that date. A certain class of parsons, to get a marriage fee, persuaded the more ignorant negroes that their marriages were illegal, and hence Prince's trouble and Louisa's rebellion.

Here is the Solicitor's account of the case of Dick Ellerbe, endorsed on the petition for executive clemency:

"This party belonged to the 'Spring Hill Gang of Robbers' who infested that country several years ago. One was killed while resisting arrest and after having killed one of the posse. Some escaped. Jake Jennings and Dick Ellerbe were caught. Dick Ellerbe pleaded guilty, and at that time the judge had no discretion, but had to sentence him for life. Jake Jennings was convicted. and, I think, sentenced to five years in the penitentiary. It may be well enough to commute Dick's sentence to an equality with that of Jake, but I know of no mitigating circumstances. Jake's sentence was reduced to five years because of the recommendation to mercy by the jury, etc."

You will observe the operation in this case of the statute referred to above. Jake Jennings, the negro, does not "suffer the full penalty of the law," but is recommended to mercy, and Dick Ellerbe, though confessing his crime, also obtains mercy. It is, no doubt, a touching fact that this negro has eight helpless children, whose mother and grandmother have died while the father was in prison. But what has this to do with the justice of his punishment? Will any one say that a man who belongs to a "gang of robbers that have infested a community for several years," and who kill one of a posse sent to arrest them, should go unpunished because he has a houseful of helpless children?

The next case on the docket is that of Eli Moore. You say:

"He was sentenced to ten years' imprisonment for manslaughter. Eight of the jurors who tried the case ask for his pardon on the ground 'that there is reason to believe that Moore did not do the shooting, and that it was done by a white man who left the State immediately after the shooting and did not return until after the trial.' It apparently did not seem worth while to trouble this white man by ascertaining the truth of the matter, which was adjusted by a commutation of Moore's sentence from ten years to five."

The reader would naturally infer from the above statement that Eli Moore would not be guilty at all should it be proved that the white man did the shooting. But even were this proved, Eli Moore would still be guilty and deserve the punishment he is receiving. He and others, including, probably, this white man, constituted a gang that murdered a colored man named Mitchell Godbold. Which one of the party actually fired the shot that killed Godbold, will probably never be known. Only two of the party were caught—Haines Graham and Eli Moore. The evidence at the time of the trial was that Moore did the shooting, and so his punishment was made greater than that of Graham. Will any one deny that these men should have been punished? Will any one affirm their punishment was too great? And does the petition, signed by white men, that Moore's punishment should be mitigated, since there is a probability that he did not do the actual shooting, look as if "the State is quite willing to dispense with the formality of the actual commission of a crime by a negro in order to secure his services as a convict"? But why was the suspected *white man* never arrested? I have not the information requisite to answer this question; but it is no uncommon thing for a man to be strongly suspected of a crime, and yet for the evidence to be too slight to warrant his arrest. At any rate, you may be sure that a white man that joins a band of negroes to commit murder, will hardly be regarded with any special affection by the whites.

I close with the case of Capers Allen; and I select it, partly because it is the saddest and most damaging of all, and partly because, though bad in itself, it is unintentionally made to appear much worse than it really is, by the mode of stating it. Your statement is:

"In 1887, Capers Allen, also colored, was accused of murder. His employer at once came forward and testified that the prisoner, who was quite young, was four miles away when the murder was committed. Subsequently, the boy was rearrested without his employer's knowledge, tried, and sentenced to be hanged, the sentence being commuted by Gov. Hampton to imprisonment for life. The employer has made repeated efforts to secure his release, but not until eleven years have gone by is he finally successful."

Your statement is a fair presentation of the case as it is recorded in the Governor's Statement; but that statement, from its very brevity, has to omit much matter that is necessary to the understanding of the case. Gen. Bonham, Capers Allen's attorney, assures me that the facts are these: When Clayton Allen was killed, several negroes were arrested on suspicion, among them Capers Allen, then in the employ of P. B. Allen. P. B. Allen at once informed the party that held these negroes in arrest that Capers Allen was with him, four miles away, late in the evening of the night that Clayton Allen was killed; and that he felt quite sure Capers could not have been among the murderers. Whereupon Capers was released. Some time afterwards, the evidence against Capers being very strong, he was rearrested, tried, and convicted. P. B. Allen, his former employer, living, at the time of Capers's arrest, in a different county, knew nothing for a long time of Capers's conviction. As soon as he heard of it he took steps to secure his release, and was successful, Gen. Bonham being the attorney. Why it was that the testimony of P. B. Allen to an *alibi* that was adduced when Capers was first arrested, and which led to his release at that time, was not brought forward when he was tried and convicted, is not known. Capers's attorney (a lawyer, appointed by the judge at the time of the trial) knew nothing of such testimony. Here was the great and fatal mistake that consigned an innocent man to imprisonment for eleven years. But as soon as the mistake was detected it was corrected.

The petition makes a different impression. It declares that P. B. Allen had *all along* testified to Capers's absence from the scene of the murder; and the impression is made that Capers was kept in confinement for eleven

years, during all which time P. B. Allen was urging his release, and testifying to an *alibi* in his favor. Gen. Bonham assures me that this was not the case; that as soon as P. B. Allen's testimony was produced it was acted on, and Capers was pardoned.

It is necessary to say a word about these petitions in general, and about the Governor's Statement. The petitions always present the most favorable side of the case. They assume as known all the unfavorable features, and urge only those matters favorable to the prisoner; and they are so apt to strain facts in the prisoner's favor that the Governor feels obliged to write to men of high character in possession of the facts, in order to be well informed before acting on the petition. But the Governor cannot embody all these facts in his Statement. The purpose of the Statement is to inform the public as to whom he has pardoned, and, in the briefest possible way, of the ground of his action. He naturally mentions only the mitigating circumstances. The impression, therefore, is apt to be made that these persons were unjustly punished in the first instance. But if one will only take the trouble to investigate, he will find that there is quite another side to the picture than that presented in petitions. The papers containing the facts in the cases of all who have applied for pardon or commutation are carefully preserved by the Governor, and he will take pleasure in supplying such papers to all responsible persons who seriously desire to inquire into the facts.

The administration of justice in South Carolina is not perfect. But we claim that our laws are impartial and our judges incorruptible. As long as human nature is weak, and juries are made of men many of whom are ignorant and prejudiced, and some corruptible (and this is true of juries everywhere in this country), the innocent will sometimes be punished, and the guilty will sometimes go unpunished. The good people of South Carolina deplore the evils that exist among them far more deeply than it is possible for any one at a distance to do. But we have not yet reached that condition of things described in your article. With all our faults, we are still a civilized community.

W. J. Alexander.

University of South Carolina, April 12, 1889.

EAST AND WEST.

To the Editor of The Nation:

Sir: It would be bad enough to be advertised as applying the term "effete East" to our busy and exaggeratedly living Eastern centres of thought and commerce, if one had really committed such a solecism; but imagine yourself to have given an address, Mr. Editor, where the very opposite idea was advanced, and where the Eastern States were pictured as the source and inspiration of all Western thought and advancement, and then try and realize your feelings when you saw yourself described to the world as speaking of the "effete East." Surely an author so unfortunate deserves at least the privilege and opportunity of explanation; and though the matter is a very small one to the great East maligned as "effete," the Westerner involved in the case feels very much in the mood for reprisals, at least to the extent of an explanation.

The address in question was upon "The Relations of the East and the West"; and in speaking of the possibilities of future development in our great country, the author alluded to the difference between inland and coast civilizations. The fact was adverted to that coast civilizations—or periods of flower in culture—are usually most brilliant, but short-lived, like the era of Athenian splendor or the Italian Renaissance. Inland civilizations, on the contrary, are of slower growth and longer duration, but are in danger of fossilizing, as did Egypt, for instance. The author then drew attention to the great inland region comprising our so-called Western States, and spoke of the possibility open to them of developing a unique civilization individual in type. The fact was emphasized that the Eastern or coast States had been the original guides and inspirers of the West, and that they would always remain the high seats of a culture peculiarly their own, as their location upon the coast made them sensitive to the thought pulsations of the world. This position would enable them to transmit to the inland region of the West constantly fresh incentives and impulses, which, having done their destined work of rousing, would return to their originators with a new and characteristic flavor.

The idea was, that this constant repulsation would enable the East and the West to maintain each its own type of culture and keep both from stagnating; but the fact was insisted upon that, in order to develop and maintain an individual culture, the West must have her own libraries and universities, and only send her young men and women East after their powers have been ripened and matured in purely Western fashion. It was the elaboration of this last conclusion which probably left upon the mind of the weary listener the idea that the author considered the East "effete," and the mistake is only worth correcting because it voices a feeling in regard to Eastern culture too prevalent in the far West, and which Eastern people are too ready to attribute to the West as a whole.

AMERICAN WOOD-ENGRAVING IN DANGER.

To the Editor of The Nation:

Sir: "An English Estimate of American Wood-Engraving," and the criticism of it in your issue of April 11, cannot help striking an American observer humorously. After the American school of wood-engravers not only has, in the quietest way, won the general admiration of the other part of the civilized world, but is really studied and imitated from Paris to St. Petersburg, and from Stockholm to Rome, while the English conservatives have for the last twenty years never turned their faces forward, for the simple reason that they had once discovered something by looking backward; and now that they try to imitate the Americans—we are to blame for it all. But, as the writer in the above-mentioned article says, "There are shortcomings in regard to book-illustrations." We admit this even if we accept the present method of magazine illustration as good in general. It is certainly the only method possible at present to interest the public.

The making up of a magazine is not practically identical with the art of bookmaking, nor criticism of a magazine with criticism on bookmaking. Nevertheless, the illustrations (wood-engravings) in our magazines have greatly fallen off in interest to our public for some time, if we may judge from the meagre notices of the daily press for the last two years. In particular there were the long war articles and physical and geographical articles in the *Century*, which left little space for artistic efforts either for artists or engravers; and we find there also, in other work which could be more broadly and artistically treated, a tendency to bring out details without regard to the harmony of the whole—a kind of amateur work, with little blacks and lights all over it very discouraging to the friends of the art. On the other hand, we find in *Harper's Magazine* a tendency to over-fineness and overcrowded pages, the result of reducing large original drawings and pictures to a small size. This deplorable mistake of our magazines generally has been noticed and criticised in Europe. It leads the public from a healthy pictorial study into a kind of map-examination. We may constantly observe that if any one opens a magazine, he will read for a while, keeping the book at the proper distance till he turns a page, when up goes the book, three or four inches nearer to his face, to make out one of these fine woodcuts, filled like a storehouse—the little light which was left by the engraver having vanished by filling up in the printing, thus leaving often a very dark, indistinct picture. So the dailies, as well as the public, are not much to blame for the falling off in interest in our fine wood-engravings.

Yet there is another feature even worse than this: the magazines have more or less, for the last two years, tried to get tone "process" reproductions instead of wood-engravings, and these have even appeared as frontispieces. The general public, not knowing about the manufacture of these things, have necessarily taken them for superior wood-engravings, since they are not mentioned as tone process anywhere. They must also frequently have felt the necessity of drawing the book still nearer, with a sensation of black sand flying in front of their eyes, owing to their blurred and foggy appearance. This is the latest improvement in American illustrations. Another kind of tone process is made on a lined plate; it appears more clean and distinct, but also more mechanical, flat, and artistically uninteresting.

As to the reproductive qualities of this process, we cannot understand how artists of renown, who are constantly preaching about distinct tones and values, can bear to see themselves represented in such a style. We need only point to Mr. Chase's pictures in *Harper's* March number—a contradiction of their own teachings. We sometimes hear artists prefer these blurred performances because they come nearer a facsimile of the artist; we know of many instances in which such a facsimile was kept, but the picture was lost. Still, we cannot quarrel with the artists if they choose this line, but to the combination of "process" with type in a book we have a right to object. There is nothing more artistic than harmony; in fact, it is the first law of all art. But the sharp-cut letterpress characters and the blurred impressions of "process" side by side are anything but agreeable to our eyes, and almost revolting.

It is much the same with the ornamental drawings of pen-and-ink process. This scratchy work may be all very artistic in itself, but can never join with the letterpress like a clear woodcut. There is a warmth in the line of the latter and a solidity which harmonize perfectly with good letterpress, and therefore the old method (especially that of the sixteenth century) is more agreeable, more impressive, and therefore more artistic, but not exactly cheaper.

We think we have pointed out the main evils at present visible in the way of good bookmaking with illustrations, and that it is only proper to inform the public, that they may be enabled to understand the difference between "process" and wood-engraving. To this end, the magazines ought to state, either on the page or in the table of contents, which is which. Meantime, with hearty good wishes to the craft of wood-engravers, we bid them see to it that

the interest of the public in this highly cultivating art be kept alive, since every art must decline which does not find a public to appreciate it. AMEN.

AN ITEM IN BALLOT REFORM.

TO THE EDITOR OF THE NATION:

SIR: A bill has been introduced in the Minnesota Legislature, and is now before the Judiciary Committee, to adopt the Rhines vote-recording machine in all general and special elections in the State.

This machine is the invention of Mr. J. W. Rhines of St. Paul. It seems to combine all the virtues of the Australian system with a number of other good points. The ordinary paging machine of the printer suggested the main idea to Mr. Rhines. The principle involved is that of the counting-machine, as in the odometer. It is old, time-tried, and absolutely accurate.

The practical machine is an oblong brass box about 10x14 inches, six inches deep, with a hinged cover. This box is placed on a small stand in the rear of the polling-room, and in plain sight of the judges and clerks of election. The voter is identified by the judges, and passes into the stall where the machine is. On raising the lid of the box, a screen is drawn up before the stall, shutting both voter and machine from view. The lid when raised discloses a number of keys not unlike organ stops. There are as many rows of keys as there are tickets in the field, and as many keys in a row as there are offices to be filled. The printed name of each candidate and the office to which he aspires are placed in the top of these keys.

The elector in voting presses down the key bearing the name of the candidate he wishes to support. The key remains down. In being depressed it has locked all the keys of other candidates to the same office, thus making it impossible for an elector to vote for more than one candidate to the same office; at the same time this key has imprinted indelibly, on a slip of paper beneath, a number—which is the total vote cast for that candidate at that time. The elector votes for each of the other offices in turn, in the same way, shuts down the lid of the box, thus ringing an alarm bell and dropping the screen in front, exposing machine and voter to the view of the judges. The box lid on being closed liberates all the keys, and the machine is ready for the next voter.

When the last elector has voted, the count is already made and recorded for each candidate. The turnstile at the judges' desk has recorded the total number of voters. The slip of paper bearing the record of the vote can be most easily preserved.

This system assures absolute secrecy of ballot and absolute accuracy of count. It requires a sort of an educational qualification, in that the keys must be read; and yet there is an ingenious scheme already proposed, that all Republican keys be colored red, all Democratic keys white, etc., so that an elector could vote any straight ticket he chose, and be relieved from all intellectual exertion further than distinguishing between two colors! It saves the expense of printing ballots, and, better than this, it does away with the tedious and inaccurate counting of paper ballots; as a consequence of this, contested elections will be a thing of the past.

Absolute secrecy being assured, bribery at elections will be dealt a most telling blow, for the briber can no longer be sure of his purchase. J. PAUL GOODE.

UNIVERSITY OF MINNESOTA, April 8, 1889.

BY AND BY.

TO THE EDITOR OF THE NATION:

SIR: The reviewer of Murray's 'New English Dictionary,' in the *Nation* of April 4, cites the expression *by and by* as a case in which the Dictionary falls short of perfection. This phrase, he says, "is used by Chaucer in the sense of nearness in space as well as of nearness in time." And he goes on to refer to a line in the Knight's Tale as one of the examples which "have not been given because they have not been received." Now the very first meaning given under the heading *by and by* is the following: "Of a succession of (persons or things): One by one, one after another, in order: a. in place." This is supported by four illustrations, all as apposite as the one mentioned by your reviewer. Indeed, the line from the Knight's Tale,

"Two yongë knightës lying by and by,"

could hardly be more exactly paralleled, for lexical purposes, than by the expression of much earlier date quoted from Robert of Brunne, in which, referring to the heads of the slain, we are told that "he laid them by and by."

In speaking of this colossal dictionary would it not be well for reviewers to imitate the caution of the scientist, who will not say "There are no ghosts in nature," but rather, "That part of the book of nature which I have read is silent touching the phenomena known as ghosts"? M. B. A.

STATE UNIVERSITY OF IOWA, April 6, 1889.

[There are not many persons, presumably, who suppose that the expression "one after another" conveys necessarily the idea of nearness in space, and is therefore equivalent to "close together, side by side"; at least if they do, they are not usually employed in defining words for dictionaries. It was to exclude the idea of succession, which may or may not involve the idea of nearness, that the line was cited from the Knight's Tale, to which the idea of nearness was essential. In a similar way in the Reeve's Tale the Miller's daughter is said to have had a bed to herself "in the same chamber by and by." The cautious scientist may fancy that she had a bed "in succession," whatever that may mean; the ordinary reader will suppose that she simply had one "close by," on account of the smallness of the room.—ED. NATION.]

Notes.

J. B. LIPPINCOTT CO. have in press Prof. Carl Justi's 'Diego Velasquez and his Times,' translated by Prof. A. H. Keane, and liberally illustrated; Pierre Paris's 'Manual of Ancient Sculpture,' edited and augmented by Jane E. Harrison; 'Half Hours with Humorous Authors,' by Charles Morris; 'Eight Hundred Miles in an Ambulance,' by Laura Winthrop Johnson; and 'Francis Bacon (Part II),' by John Nichol.

A collection of the verse of Mrs. Graham R. Janson, under the title, 'The Bird Bride: a Volume of Ballads and Sonnets,' is announced by Longmans, Green & Co.

G. P. Putnam's Sons will bring out in the fall as a subscription work a 'History of the Nineteenth Army Corps,' by Lieut.-Col. Richard B. Irwin. It will be accompanied by new maps of the campaigns and by portraits of commanders.

White & Allen have collected for publication in a popular volume Mrs. Martha J. Lamb's papers on the 'Inauguration of Washington in 1789.'

"Balaustion's Adventure," "Prince Hohenstiel-Schwangau," and "Fifine at the Fair" compose the eleventh volume of Browning's Poetical Works, published in this country by Macmillan & Co. "Red Cotton Night-Cap Country" and "The Inn Album" fill out the twelfth volume. The generous print of this edition adds to its acceptability as the author's edition with his latest, and perhaps final, revision.

There are a few bright passages, descriptive of life and scenery in the diamond mines, in 'An I.D.B. in South Africa' (John W. Lovell Co.), by Louise Vescelius-Sheldon, which remind one of that pleasant book of travels by the same author, 'Yankee Girls in Zulu Land.' These are set in a crude story with a childish plot, turning upon the detection of an "illicit diamond-buyer," as those dealers are called who buy stones secreted by the Kafir miners. Numerous illustrations, the best being by C. E. Graves, give to the book a very taking appearance which its contents, we regret to say, fail to justify.

'Home Gymnastics' (without apparatus) is a handsome and attractive book translated from the German of Angerstein and Eckler, the original having reached an eighth edition (Boston: Houghton, Mifflin & Co.). It is adapted both for the well and the sick, and exhibits the several exercises by means of cuts based upon photographs. Anything which promotes a steady regard for health by way of counteracting sedentary habits, senseless costume, or discreditable ignorance of physiology and hygiene, is to be commended, and this work, though not the first of its kind, deserves to have its vogue, and is certain to do good. A happy thought has led to the grouping on one folded sheet that can be put upon the wall, of all the cuts scattered through the text.

All great cities are interested in the endeavors of any one of them to cope with the sewage problem. In Massachusetts, the State Board of Health has had the duty laid upon it of determining how to dispose of the sewage in the Mystic and Charles River valleys; these two streams emptying into Boston Harbor, and their united territory being really a part of the metropolitan district. The Board's Report (Senate document, No. 2, 1889) will repay reading. It has a number of excellent maps.

Curious for its maps and colored plates, as well as for its discussion, is the preliminary report on "Peach Yellows," by Erwin F. Smith, special agent of the Department of Agriculture. The peach flourishes or may be cultivated from the northeastern corner of Massachusetts as far west as the 100th meridian, though from the south end of Lake Michigan the line dips southerly till it reaches the 39th parallel. The southern confine extends from the southeastern corner of Virginia, parallel with the coast and well removed from the lowlands, almost to the Rio Grande. The peach reasserts itself throughout the Pacific Coast States.

We have received the first annual report of the Marine Biological Laboratory situated at Wood's Holl, Mass. It relates the history of the institution, an outgrowth of the seaside laboratory maintained for six years at Annisquam by the Boston Woman's Education Association and the Boston Society of Natural History, and records the achievements of the past year, which went little beyond the erection of a building and its equipment in an unsurpassed degree. The end in view is "the establishment of an ideal biological station,

organized on a basis broad enough to represent all important features of the several types of laboratories hitherto known in Europe and America," instruction and investigation going hand-in-hand together—and both sexes, we will add, taking part in the management and in the studies: two "Lucretia Crocker Scholarships" are being raised. The laboratory for investigators will be open from June 3 to August 31; that for students, on July 10 for seven weeks, for regular courses in marine zoölogy and microscopical technique. The secretary is Miss A. D. Phillips, 23 Marlborough Street, Boston.

Part 3, vol. v., of the Proceedings of the American Antiquarian Society at Worcester, Mass., appeals by its contents to a great variety of tastes. The obituaries are noticeable, and of the late Sydney Howard Gay it is related that, his family homestead at Hingham, Mass., having been burned, and the ground incorporated in the cemetery, his remains lie in the very spot occupied by the dwelling-house—a rare occurrence, surely. Mr. Edward Everett Hale has a paper on the naval history of the Revolution, a neglected topic; Prof. A. P. Peabody defines and illustrates "Hopkinsianism," with the aid of some hitherto unpublished correspondence between Roger Sherman and Samuel Hopkins; and Mr. Andrew McFarlane Davis discusses the site of the first college building at Cambridge, Mass., and fixes it near that of the Wadsworth House. The Librarian, Mr. Barton, brings to light from an old file of papers "Rules for the Society of Negroes, 1693," endorsed in the handwriting of Judge Sewall, March 23, 1713–14. These "Miserable Children of *Adam*, and of *Noah*," among many good moral resolutions, pledged themselves one to another (no doubt with a mental reservation) to afford no shelter to runaways; "but we will do what in us lies, that they may be discovered, and punished."

To the April number of the *Library* Mr. Blades contributes an interesting and valuable paper on "Signatures in Old Books." After describing some of the different methods of signing the sheets of manuscripts, in use from the thirteenth to the fifteenth century, he traces briefly the transition from manuscript to printed signatures, and illustrates the various steps in signature development by references to a number of early printed books. Thus he gives several examples of the use of manuscript signatures in addition to the well-known case of the Mazarin Bible, notes the occurrence of manuscript and printed signatures in the same volume, instancing the British Museum copy of Horace (Milan, 1474), in which the signatures as far as D are all inserted by the pen, while after that printed signatures are used. Then came signatures stamped in by hand with separate types, followed by signatures printed at the same time as the text, but placed at the extreme lower margin of the sheet; and finally some early examples are given of what he calls the normal signature, printed in the line just beneath the text, a method which seems to have been first used at Cologne.

An exceedingly suggestive paper on the "Depopulation of the Rural Districts" was recently (March 19) read before the Royal Statistical Society by Dr. Wm. Ogle. In it he showed that, so far as England was concerned, the country was not being depopulated in the proper sense of the term. During the thirty years between the censuses of 1851 and 1881, the aggregate rural population of the fifteen distinctively agricultural counties had not perceptibly decreased, a slight loss in the eastern counties being nearly balanced by a positive gain in the others. The character of the occupations of the people had changed in their relative proportions, there having been a decline in the number of farmers and farm-laborers, persons engaged in various handicrafts, as brickmakers, blacksmiths, etc., and liquor-dealers, while shopkeepers, house-servants, gardeners, and teachers had greatly increased. In one sense, however, it was strictly true that the towns were gaining at the expense of the country. The most energetic and vigorous members of the rural communities are constantly migrating into the manufacturing districts, where the higher mortality is resulting in a "gradual deterioration in the physique of the whole population." There can be no doubt that this is equally the case in this country, though not to so great an extent, and, accordingly, this fact gives the greater importance to every effort, in the older States especially, to make village and country life more attractive to the young. A well-sustained free library, for instance, may exert a powerful influence over the village boy in strengthening his natural affection for his birthplace, and making it harder for him to leave it when manhood comes.

— An event of more than ordinary interest to collectors is announced by the appearance of a catalogue of ninety-one manuscripts on vellum, illuminated by English, Byzantine, French, Flemish, Dutch, Italian, and Spanish artists of the seventh to the seventeenth century, chiefly from the famous Hamilton collection, and till lately in the possession of the Royal Museum in Berlin, accompanied by twelve plates of facsimiles. This remarkable collection is to be sold, under the auspices of Karl J. Trübner, Strassburg, at auction (unless previously disposed of by private contract) in London, on May 23, by Sotheby, Wilkinson & Hodge, and the circumstances of the sale seem to demand a word of explanation. In 1882, the whole Hamilton Palace collection of manuscripts was secured by the Royal Museum in Berlin, and it is understood that the price agreed upon was £74,000; the Prussian Government, however, granted only about £50,000 for the purchase of the collection. The Museum authorities hoped to obtain a supplemental grant which would enable them to keep the collection intact, but in this they have been disappointed, and are therefore forced to dispose of a portion of it. They retain, of course, the Botticelli Dante, and a number of other manuscripts, chiefly Italian, French, and Oriental.

— Of the ninety-one included in the catalogue, sixty are from the original Hamilton collection, and among them are some of its choicest treasures. Chief of these is the beautiful seventh-century manuscript of the Gospels, on purple vellum in letters of gold, which there is every reason to believe is the one written for Wilfrid of York by Anglo-Saxon scribes between 670 and 680, and which, after various wanderings, was presented to Henry the Eighth by Leo the Tenth. This manuscript has recently been carefully examined by Wattenbach, who supports this view of its origin, which is also confirmed by the investigations of De Rossi. For this manuscript alone it is said that £5,000 has been offered by an English dealer. Another manuscript of great artistic and literary value is a *Bestiarius*, the work of an English scribe about 1175, containing one hundred miniatures beautifully drawn, and colored in the style of that period. The Carolingian age is represented by a manuscript of the ninth century, considered upon internal evidence as probably written by an Irish scribe at St. Gall. Of Byzantine art at its best there are two specimens, a Greek Evangelistarium of the eleventh century, containing thirteen miniatures, and one of the twelfth century, also beautifully illuminated. Among the many interesting French manuscripts which deserve notice only one or two can be mentioned. Of the first half of the thirteenth century is a Josephus, with many finely executed miniatures in the earliest Gothic style; while the art of the fourteenth century is richly represented by a manuscript of the 'Roman de la Rose,' containing one hundred miniatures in grisaille, a volume of *Chansons* with twelve miniature portraits, a 'Généalogie de la sainte Vierge,' illustrated by a Norman artist, and several others. Among the many beautiful fifteenth century works 'Les illustres Malheureux' of Boccaccio, with eighty exquisite miniatures, and a French translation of Diodorus Siculus, illuminated by the celebrated Geofroy Tory for Francis the First, must not be omitted. The Italian school is represented by a fourteenth-century Bible with miniatures and illuminations, a splendid *Antiphonale* richly illustrated, and a manuscript of Columella, among others of the fifteenth century. Of German and Flemish art there are some fine examples of various dates, but we can mention only the French translation of St. Augustine's 'City of God' in two volumes, illustrated by Flemish artists of the fourteenth and fifteenth centuries, and considered one of the finest specimens of miniature art in existence. Books of hours, breviaries, and missals are well represented, and many of the manuscripts possess not only great beauty, but interesting historical associations. Even this imperfect sketch of the catalogue must make it evident that an opportunity, not likely to occur again, is here offered to secure for a public institution a collection which would furnish in itself an epitome of miniature art such as few European museums can surpass, or even equal. To the New York Metropolitan Museum it would be an invaluable acquisition, and it is to be hoped that an effort may be made to obtain it.

—We have received the first part of the catalogue of the historical library so generously bestowed on Cornell University by ex-President White. This portion is devoted to "The Protestant Reformation and its Forerunners," and if the task is completed in the same careful and elaborate manner, the catalogue will be worthy of the extensive and valuable collection which it so minutely describes. Mr. Burr, the compiler, has condensed in it a treasure of bibliographical information which will render it valuable as a work of reference to many students besides those who have access to the library itself. In looking over it, indeed, our only regret is that such a mass of rare historical material should not be situated in some centre of population where it would be more accessible to scholars in general. In many respects we presume that the collection is unique in this country. There is a MS. life of Savonarola, which Mr. Burr conjectures may be the original source of those of Pico and Burlamacchi. There is a copy of the commentaries on the Catechism by Archbishop Carranza, which was rigorously suppressed, and which gave to the Spanish Inquisition its most illustrious victim. There is a 1500 edition of the 'Taxes of the Penitentiary,' which ultra-Catholics are fond of assuming to be a post-Reformation forgery. It is in contemporary editions of the early German Reformers, however, that the collection is the richest, and the titles Erasmus, Von Hutten, Luther, Melanchthon, and others bear ample testimony to the enlightened industry of the collector and the bibliographical skill of the compiler.

—There are some items, nevertheless, that surprise us by their absence. Under Flacius Illyricus we do not find the 'Catalogus Testium Veritatis,' nor under Théodore de Bèze his 'Histoire Ecclésiastique.' We cannot imagine the collection to be wanting in them, nor any reasonable limitation that should exclude them from this section of the catalogue. Of the 'Institutes' of Calvin there seems to be no copy of the original, but only a modern English version. Lefèvre d'Étaples is conspicuous by his absence, and so are the Spanish reformers. Of Juan de Valdés there is only Betts's translation of the 'Considerations,' and no copy of the 'Dos Diálogos' of Juan and his brother Alfonso—a book quite as significant in its way as the 'Colloquies' of Erasmus or the 'Epistolæ Obscurorum Virorum.' Juan Perez, Cipriano de Valera, and Francisco de Enzinas are likewise absent—in fact, all the writers reprinted with such pious care by Usóz y Rio in his "Reformistas Antiguos Españoles." We miss even so common a book as Adolfo de Castro's 'Protestantes Españoles,' in both its Spanish and English dress. If these remarks were offered as criticism, they would be manifestly unfair; but where a collection is so large and valuable as this, one cannot resist the temptation of pointing out the deficiencies which its custodians can readily fill. To satisfy our critical conscience, we will indicate a single trifling lapse—under Jerome Barlowe (p. 4) there ought to be a direct reference to Arber's Reprints.

—Who was Washington's schoolmaster? Aside from allusions to Hobby and Williams, this question is not answered in the standard biographies. Nor does it seem to have attracted the attention of antiquarians who, in this centennial year of his inauguration, hold every Washingtonian item, however trivial, worth its weight in gold. There is the more reason to trace out Washington's principal teacher because he was probably a convict. A statement to this effect appeared a dozen years ago in the London *Notes and Queries* (s. 5, vol. v, p. 501). The words are these:

"Mr. Washington was the second of five sons of parents distinguished neither for their rank nor fortune. . . . George—who, like most people thereabouts at that time, had no other education than reading, writing, and accounts, *which he was taught by a convict servant whom his father bought for a schoolmaster*—first set out in the world as surveyor of Orange County," etc.

—This extract is from the autobiography of the Rev. Jonathan Boucher, who, from 1760 till the Revolution, was a teacher and preacher in Washington's neighborhood, and who even became the tutor of Washington's stepson, Parke Custis. This connection, Boucher claims, "laid the foundation of a very particular intimacy and friendship" with the stepfather. The truth regarding Washington's tutor must have been known to Boucher, nor was he likely to write untruth in a private journal which he had no thought of publishing, and which, aside from fragments in *Notes and Queries*, still remains in manuscript. The testimony of Boucher was probably unknown to Sparks and Irving. If known to them and believed, they would doubtless have ignored it as beneath the dignity of history. Nowadays we are less squeamish. How gladly would we welcome such a description of Washington's tutor as was given of a contemporary pedagogue in that quarter by the following advertisement: "Ran away from Rev. D. Magill, Upper-Marlborough, Maryland, a servant, clothed with damask breeches and vest, black broadcloth coat, broadcloth cloak of copper colour, lined and trimmed with black, and wearing black stockings." So complete are the Old Bailey chronicles of transports shipped to the American plantations that the extraction of Washington's tutor would seem to be ascertainable.

—The increasing philological and theological interest in the Greek translations of the Old Testament is illustrated by Dr. Edwin Hatch's 'Essays in Biblical Greek' (Oxford: The Clarendon Press; New York: Macmillan), the substance of lectures delivered by him during his terms of office as Grinfield Lecturer on the Septuagint. His topics are: the value and use of the Septuagint; short studies of the meanings of words in Biblical Greek; psychological terms in Biblical Greek; early quotations from the Septuagint; composite quotations from the Septuagint; Origen's revision of the Lxx text of Job; the text of Ecclesiasticus. The most interesting critical question raised by the author relates to the possibility of going behind the three Septuagint recensions of Jerome's time, and reconstructing the text or texts from which these were formed. The solution of this question must be sought in the examination of quotations from the Septuagint in writings of the first two centuries of our era; and by way of applying this method, Dr. Hatch selects the citations from Psalms and Isaiah in Philo, Clement of Rome, Barnabas, and Justin Martyr, with some interesting results. The importance of the Septuagint for fixing the meaning of New Testament terms is becoming more and more apparent, and such work as Dr. Hatch has done will help to guard New Testament exegesis against a good deal of the looseness that still prevails; we may instance his sections on *arete* (as "glory, praise"), *deisidaimonia* ("superstition"), *diatheke* (always "covenant"), *dikaiosune* and *eleemosune* as interchangeable, and *musterion*. He has collected a large mass of material, which he treats with scholarly discrimination and breadth. The difficulties which he and others encounter in the examination of the Septuagint, force on our attention the necessity for a new edition of its text, a thoroughly critical handling of manuscripts, versions and quotations. If the time is not completely ripe for such an attempt, a beginning at least should be made, and the completion of the Cambridge edition will be hailed with warm satisfaction.

BALL'S HISTORY OF MATHEMATICS.

A Short Account of the History of Mathematics. By William W. Rouse Ball, Fellow and Assistant Tutor of Trinity College, Cambridge, and of the Inner Temple, Barrister at Law. Macmillan & Co. 1888. 8vo, pp. xxiii, 464.

Of all the departments of knowledge in which exact results are attainable either by reflection or experience, mathematics and astronomy seem to be the ones which—to borrow a term from the law—mankind first endeavored to codify. Astronomical speculations can be traced back, and finally fade away, into the mists of antiquity. But astronomy as a science has always depended upon mathematics, and we are justified in asserting that mathematics is the oldest of the sciences. We should not, perhaps, speak too strongly if we asserted that the history of mathematics is the history of the development of the human intellect. To treat in a satisfactory manner a subject so vast evidently requires a man not only of great learning, but of great intellectual power. The smaller the compass within which he is obliged to confine himself, the harder does the task become. To write anything worthy of the name of a history of mathematics in one volume would be more difficult than to write it in ten. He should, among other qualifications, be acquainted not only with the works of those mathematicians who have discovered new theorems and new methods, but also with the works of those who have written on the philosophy of mathematics; who, by coördinating, and giving symmetry and consistency to what is already known, have smoothed the way to further progress.

In broad general views Mr. Ball seems to be greatly lacking, and equally lacking in his knowledge of those writers who have taken such views. We will give a single example. Auguste Comte and his works have passed into history. It is considerably more than half a century since the publication of the first volume of his 'Philosophie Positive.' Its special title is 'Les Préliminaires Généraux et la Philosophie Mathématique.' It has been widely read by the mathematicians of Europe and America. It was translated into English by Professor Gillespie of Union College, himself a pupil of Comte and a graduate of the Polytechnique at Paris when Comte was regarded as the most brilliant professor in that most illustrious of mathematical schools. The influence of Comte's work on the history of mathematics has been very great. It can be traced alike in the ordinary text-books and in the profoundest treatises. Comte added no specific inventions or discoveries to mathematical science, not so much from inability as because he worked with different purposes and for different ends. He grasped almost all the mathematical knowledge of the ages which had preceded him, condensed it, pointed out the interdependence of its parts, gave it symmetry and coherency, and left a work which will always be regarded as one of the greatest intellectual achievements of the nineteenth century. Yet Mr. Ball does not even mention his name. Were his 'History of Mathematics' our only source of information, we should not know that the great teacher of teachers had ever lived. The general impression of Mr. Ball's book is that of a small boy trying to carry too large an armful of wood. He drops a stick here and a stick there, but comforts himself with the belief that he will get home with enough to build a fire.

Passing over the lack of broad and comprehensive views, let us look a little at the author's accuracy. On page 151 he attempts to give the origin and meaning of the word *Algebra*. He is treating of the life and works of the Arabian mathematician Alkarismi, who wrote a treatise on Algebra about A.D. 830. Of this treatise he says:

"The work is termed *Al-gebr we'l mukabala*; al-gebr, from which the word algebra is derived, means that any the same magnitude may be added to or subtracted from both sides of an equation; *al mukabala* means combination of like terms into a single term."

Of the words *al gebr*, the first is merely the article *the;* the noun *gebr* is the significant part. Arabic is a very rich and a very expressive language, but when Mr. Ball gets out of a single word all he has stated above as its meaning, not only does he get a great deal more than there is in it, but what he gets is not in it at all. The noun *gebr* is derived from the verb *gabara* (*g* pronounced in all cases like English *j* in jam), which means *to bind fast*, to *bind up*. From this comes the secondary meaning to bind together that which has been broken, to *restore* to its integrity that which has been separated. The noun *gebr* is a *nomen actionis* derived from the first form, or what in English grammar we call the active voice of the verb, and denotes the act of binding together the parts of a thing which has been broken or

fractured. The best single word by which it can be translated into English is *restoration*. By the Arabian mathematicians it was used to denote the *restoration* of the term which is necessary to complete the square of a quadratic equation. At the time Alkarismi wrote, the solution of quadratic equations was the highest point that Arabic algebra had attained. Such an equation, before the completion of the square, was regarded as broken or out of joint, and the completion of the square *restored* it to its normal form. Of course this process implies the truth of the axiom that if equals be added to equals, the sums will be equal. But this was not the meaning of the word *gebr;* that word meant the *restoration* of the integrity of the equation. We have no room to discuss either the form or the meaning of the word *mukabala*, as Mr. Ball transliterates it, further than to say that it referred, not so much to the "reduction of like terms into a single term," as Mr. Ball has it, as to the reduction of the equation by the extraction of the square root. The best translation, in the fewest words, of the whole phrase, is *restoration and reduction*. In a footnote on page 98 of his 'Trigonometry and Double Algebra,' De Morgan has explained this phrase in the same manner, though not so fully. We presume De Morgan had never studied Arabic, at least not to any extent, and his transliteration of the Arabic words is very bad. But he understood all the circumstances of the case, and he was wonderfully acute in seeing just what the meaning must be, even if he did not know exactly how it got there.

Of course Mr. Ball gives an account of the celebrated controversy between Newton and Leibnitz and their respective partisans as to the invention of the calculus. We have no doubt that he means to be fair and impartial. But we have as little doubt that his patriotic prejudices have so warped his judgment that his account is worthless. His worship of Newton is a sort of idolatry. The great ability of Leibnitz he admits, but he leaves on the mind of the reader the impression that it was the ability of the charlatan. Mr. Ball's chapter on the "Life and Works of Newton" occupies fifty-seven pages, a little more than one-eighth of his whole book exclusive of the index, and he speaks of him or his works in more than fifty other places to which he refers in the index. To Leibnitz he gives six pages, mostly occupied in belittling the man and his works. He mentions him in about twenty other places, but most of these are in connection with the controversy with Newton. The most Mr. Ball can bring himself to admit is that "possibly" Leibnitz may have invented the calculus independently of Newton. Even this admission is given grudgingly in a parenthesis. In stating the divisions under which he will treat the history of modern mathematics, he says: "In the second place, we have the invention of the fluxional or differential calculus about 1666 (and possibly an independent invention of it in 1674)" (p. 232). Although Mr. Ball mentions no names, yet every one will at once recognize, what he afterwards in his more detailed account expressly states, that Newton and Leibnitz are alluded to. Of course it is not possible in a review to enter into the merits of a controversy which occupies so prominent a place in the history of mathematics. We only wish to show the spirit in which Mr. Ball writes. We will also remark that the almost unanimous opinion of all mathematicians of the present day, who are acquainted with the history of mathematics during the seventeenth century, is that Newton invented the essential features of the method of fluxions eight or nine years before Leibnitz invented the differential calculus; that Leibnitz's invention was made in entire independence of Newton's, and was far superior to Newton's in form, as is proved by its complete supersedure of Newton's method even in England. Fluxions are matters of history, differentials are taught in our schools. That the differential calculus was published nine years before any account of the fluxional method was put in type, is stated by Mr. Ball and is disputed by nobody. It is generally admitted that Newton invented the method of fluxions in 1665 or 1666, but he kept it to himself until 1669. He then began to communicate it to his friends, orally or in manuscript. In 1692 he explained it in two letters to Wallis, the Savillian professor of geometry at Oxford, and Wallis published it in the second volume of his works in 1693. This was the first printed publication of the method. The first formal publication of the method by Newton himself was in 1704, when it appeared as an appendix to his work on optics.

Leibnitz claimed to have invented the calculus in 1674 in entire independence of Newton. During the present century Leibnitz's note-books have been discovered, and from them it is certain that he was using the differential calculus in 1675. He published a full account of it in 1684, nine years before any publication of Newton's method; and during those nine years it spread over all continental Europe wherever mathematics was cultivated, became firmly established, and led to many brilliant discoveries. At the present day the priority of Newton's discovery is not denied. The only question of interest now is, Did Leibnitz invent it independently, or did he manage in some way to get hold of Newton's unpublished method, and, after changing its form, publish it as his own? As we have stated above, the almost unanimous opinion of those competent to judge is, that he was an independent inventor. Mr. Ball thinks differently, and his theory of the matter is curious and original. In January, 1673, Leibnitz visited London. He left London and went to Paris in March. While in London he became acquainted with several of Newton's friends, among others with Collins and Oldenburg. He corresponded with them after he left London. The great controversy commenced in 1708, and Newton himself took it up in 1711. From that time until 1716, the year of Leibnitz's death, it was carried on with a ferocity which to men of the present time is almost incomprehensible. In fact, for half a century after Leibnitz's death, the mention of his name affected the English mathematicians much as the red flag of the *toreador* affects the bull.

Now for Mr. Ball's theory; we have italicized two words in our extract in order to show its full force:

"For myself, I think that in this correspondence from 1709 to 1716 Leibnitz did honestly believe he had invented the subject independently of Newton; but he was writing from memory of what had happened nearly forty years before, and I *suspect* that the manuscripts of Newton, which he privately admitted that he saw in 1676, *may* have been seen in 1673, and were far more important than he recollected later."

In other words, in 1709, Leibnitz had forgotten that in 1673 he stole the calculus from Collins or Oldenburg or some other friend to whom Newton had communicated it; and all the rancor and bitterness of the dispute, all the rummaging of old documents, all the representations of facts on both sides in every conceivable form of distortion that intervenes between downright lying and sober truthfulness, failed to jog his memory. But it is impossible to convict Leibnitz in 1673 and acquit him in 1709 in this way. In 1699, Nicolas Fatio de Duillers, a Swiss mathematician residing in London, had communicated to the Royal Society a paper on a celebrated mathematical problem, and in it had insinuated that Leibnitz might have borrowed from Newton, but preferred to leave the decision of the matter to those better acquainted with the facts than himself. To this Leibnitz replied, calmly but emphatically asserting his independent invention of the calculus. Whether this arose from dishonesty or failure of memory, Mr. Ball does not inform us. But he gives us data by which we can go back much further. On page 333, after denouncing Leibnitz's "duplicity" and various forms of dishonesty, he says: "Lastly, the letter to Newton in 1677 shows that Leibnitz was then in possession of the differential method, and apparently in as complete a form as that in which he published it in 1684."

This letter was written by Leibnitz to Oldenburg, to be communicated to Newton. Oldenburg was one of the men who, as Mr. Ball suspects, may have shown manuscripts of Newton to Leibnitz in 1673. Neither Oldenburg nor Newton on receiving this letter made any charge of plagiarism. Ten years afterwards, in a celebrated passage of the 'Principia' (published in 1687), Newton referred to this letter, but did not hint a suspicion that either in form or substance it had been borrowed from himself. If Leibnitz stole the calculus in 1673, he could hardly have forgotten the fact in 1677, four years (not forty) after the theft, and every one must be amazed at his audacity in exhibiting the stolen goods to the lawful owner.

There is a tone of disparagement running through almost everything that Mr. Ball says about Leibnitz. His summing up is (p. 344): "On the whole, I think his mathematical work is overrated." Every professional mathematician must have noticed how many of the methods which have been so wonderfully developed and so brilliantly applied during the present century, are traced back by those most profoundly versed in them to suggestions of Leibnitz, and they are cited as proofs of his genius. Mr. Ball "confesses and avoids" by saying: "But when a writer of manifold interests like Leibnitz throws out innumerable suggestions, some of them are likely to turn out valuable." Mr. Ball to the contrary notwithstanding, we think the mathematical reputation of Leibnitz more likely to increase than diminish as time goes on.

Every student of the differential calculus is aware of the fact that one of its principal instruments is a formula known as "Maclaurin's theorem." It is only a special case of "Taylor's theorem," and so obviously deducible from the latter that it hardly deserves a special name, though that may sometimes be convenient. In his account of Maclaurin Mr. Ball says (p. 361): "The *Treatise of Fluxions* published in 1742 was the first systematic exposition of this method. To the pure calculus he added the theorem, etc." He then gives the formula known as "Maclaurin's theorem," and his manner of obtaining it, which may be found in any text-book of the calculus (see Newcomb's Cal., p. 100). Now, Maclaurin did not discover the theorem, if so obvious a deduction from Taylor's theorem can be called a discovery, did not first use it, did not first "add it to the pure calculus," whatever that may mean, and did not first publish it to the world. That Mr. Ball knew this perfectly well, we think can be shown beyond any reasonable doubt. Maclaurin is one of his heroes, and the author of the "first systematic exposition" of the method of his great hero Newton. His admiration of his

heroes must have effaced from his memory facts which he should have stated in his 'History,' and which he has met with over and over again in the course of his studies. He has evidently read many of De Morgan's works; what English mathematician of any pretence to learning has not? He says that De Morgan "was perhaps more deeply read in the philosophy and history of mathematics than any of his contemporaries," and he speaks especially of "his great treatise on the differential calculus published in 1842, which is a work of the highest ability." On page 74 of that work De Morgan speaks of Maclaurin's theorem, "which," he says, "should be called Stirling's theorem." In a foot-note he gives all the references necessary to vindicate the priority of Stirling, who published the theorem in his 'Methodus Differentialis' in 1730, twelve years before the publication of Maclaurin's 'Treatise of Fluxions.' At the beginning of the note, De Morgan says that Maclaurin "was the first who wrote a logical treatise on fluxions." Compare this with Mr. Ball's expression quoted above, and it is difficult to avoid the inference that he had read De Morgan's note. Further, the French mathematicians very generally say that the theorem belongs to Stirling.

Again, such a well-known text-book as Todhunter's 'Differential Calculus,' perhaps more widely used in England than any other, states (p. 74) that the theorem is usually called Maclaurin's, "though, as it had been given a few years previously by Stirling, it sometimes bears the name of the latter." Once more: Mr. J. Edwards, in his text-book of the Differential Calculus published in 1886 by the same firm that publishes Mr. Ball's work, says (p. 95): "In 1717 Stirling pointed out another form of Taylor's theorem, viz.;" he then gives the formula known as "Maclaurin's theorem," with explanations, and adds the remark: "It is generally known as *Maclaurin's Theorem*, though its publication by Maclaurin was not made until twenty-five years after its first discovery by Stirling." Mr. Edwards, of course, had in his mind Stirling's 'Lineæ tertii ordinis Newtonianæ,' published in the year he mentions, 1717. That work is not accessible to us, so that we are unable to verify his statement. But as all the other authorities within our reach agree in regarding the publication in Stirling's 'Methodus Differentialis' in 1730, twelve years before its publication by Maclaurin, as the first, we think it possible that Mr. Edwards, by a slip of memory, has confounded Stirling's two works. Mr. Ball, in his brief account of Stirling (p. 323), mentions both his works, but says nothing of his discovery of the theorem. Neither can Mr. Ball's omission to state the facts, and his unconditional claim of the theorem for Maclaurin, be excused on the ground that perhaps Maclaurin discovered the theorem independently of Stirling, and, as his influence on the history of mathematics was much greater than Stirling's, he deserves the credit. Such independent discoveries form a part, and a very interesting part, of the history of mathematics. It is, however, in the highest degree improbable that Maclaurin was unacquainted with the works of his compatriot.

On the whole, we should hesitate to make any statement of importance in regard to the history of mathematics based solely on Mr. Ball's authority. As a guide to the sources of information, however, his work is of great value, and, notwithstanding the errors, the omissions, the prejudices of this 'History,' it is still one of the most interesting books we have ever read. Nearly the whole of it will be intelligible to one whose scientific education has included only so much as is required to enter the freshman class of any American college. The greater part of it can be understood by those to whom the ordinary language of arithmetic, algebra, geometry, astronomy, and physics is comprehensible.

Mr. Ball's general plan is this: he divides the history into certain chronological periods. At the beginning of each period he gives a general account of it, and then follows a series of biographical sketches of the mathematicians who lived during the period and an account of their works. Some of these notices extend to only a few lines, others cover several pages; the biography of Newton, as we have before said, occupies one-eighth of the whole work. These biographies are by no means confined to the mathematical aspects of the lives of their subjects. There are numberless stories and anecdotes relating to their morals, their pecuniary successes and failures, their domestic life. Some of these stories have a bearing on their mathematical achievements, some are sad, some are humorous, all are interesting. The general impression produced upon the reader's mind is, that mathematicians, like men engaged in any other department of human activity, present every variety of character and fortune. At one extreme are men like Archimedes, every moment of whose long life was absorbed in thinking and writing, in inventing and constructing. At the other extremity we have the Italian Cardan, an illegitimate son of a lawyer, yet educated in the highest manner known to the sixteenth century. His life was one long intellectual and moral riot. One of the greatest of mathematicians, the most brilliant professor in the oldest and at that time perhaps the most illustrious university of Europe—Bologna—his income and his influence with the nobility and the Pope were based on his fame as an astrologer. At one time absorbed in laying the foundations of the theory of equations, at another, in a mad fit of rage, he was cutting off the ears of his own child. The Pope shielded him because he believed in his astrological skill. Finally, when seventy-five years old, having predicted that he should die on a certain day, when it arrived he committed suicide.

We have room for only a few specimens of Mr. Ball's anecdotes, and those we must condense. Most of our readers have heard the story of the interview between Laplace and Napoleon I. Napoleon said: "M. Laplace, they tell me you have written this large book on the system of the universe, and have never even mentioned its Creator." Laplace replied: "I had no need of that hypothesis." But perhaps Mr. Ball's appendix to the story is not so well known. Napoleon told the story to Lagrange (who, we will say, by way of parenthesis, was a greater mathematician than Laplace), and he answered: "That is a fine hypothesis; it explains a great many things." This from the life of Kepler is both serious and comic. Kepler was poor, but married a rich and beautiful widow. He found too late that "he had purchased pecuniary ease at the expense of domestic happiness." Finally, his wife went mad and died. Then he picked out "eleven girls whose merits and demerits he carefully analyzed in a paper which is still extant; he finally selected a wrong one." She led him a worse life than the widow.

Besides personal anecdotes, Mr. Ball gives a large number, scattered through his book, of curious problems and mathematical puzzles. One of these, a very simple one, derives its interest from the fact that it is attributed to Euclid and is probably more than two thousand years old: "A mule and a donkey were going to market laden with wheat. The mule said, 'If you gave me one measure I should carry twice as much as you; but if I gave you one we should bear equal burdens.' Tell me, learned geometrician, what were their burdens?"

Mr. Ball refers to Tartaglia, a mathematician of the sixteenth century, as authority for the statement that in his time "it was not uncommon at dessert to propose arithmetical questions to the company by way of amusement." To this Mr. Ball, after mentioning in general terms certain classes of problems which "may perhaps pass muster as amusing," appends the remark, "but it certainly seems a curious way of entertaining a pretty woman to insist on an answer to so absurd a question as what would 10 be if 4 were 6, a problem on which he [Tartaglia] evidently prided himself." We would suggest that there may be possibly a difference between proposing a question to a company generally, as Tartaglia states, and "insisting on an answer" from some individual "pretty woman." Neither do we understand how Mr. Ball finds the question "so absurd." Many of our older readers may perhaps recollect that the arithmetics of the early part of the present century often contained problems stated in rhyme. One of these which we happen to recollect ran thus:

"If the third of 6 be 3,
What will the fourth of 20 be?"

Both questions are simply problems in the "rule of three." The answer to the last is 7½, and the answer to Tartaglia's is 15. We fail to see where the absurdity comes in. Mr. Ball gives several examples of these "mathematical recreations." The following is another rather grim specimen:

"A ship, on board of which there are fifteen Turks and fifteen Christians, encounters a storm, and the pilot declares that in order to save the ship, one-half of the passengers must be thrown into the sea; the men are placed in a circle, and it is agreed that every ninth man must be cast overboard, reckoning from a certain point. In what manner must the men be arranged, so that the lot may fall exclusively upon the Turks?"

As a book of reference for the names, the dates, the general character of the works, and interesting facts in the lives of most of the eminent mathematicians of past times, and to some extent of the present time, Mr. Ball's book deserves a place in the library of every professional mathematician.

Mr. Ball says in his preface that he hopes at some future time to issue a second part, a "biographical index, . . . providing as complete a list of mathematicians as is possible. It will give the dates of the birth and death of the writer, a line to say for what he was distinguished, a list of his works, and, where possible, a reference to some authority where they are treated in detail." He has our warmest wishes that he may be able to realize his hopes. Such a work would be of the highest value.

THREE NOVELS.

Cressy. By Bret Harte. Boston: Houghton, Mifflin & Co.

A Nine Men's Morrice. Stories collected and recollected by Walter Herries Pollock. Longmans, Green & Co.

Our Uncle and Our Aunt. By Amarala Martin. G. P. Putnam's Sons.

THE more Western stories we read, the less we are tempted to advise others to read them. Most of the people written about are so irreclaimably vulgar in their language, ideas, and manners as to make association with them in literature as disagreeable as it would be in real life. Such a sketch as 'Cressy' shows how diffi-

cult it is for even a very clever writer to make sheer vulgarity interesting, for if 'Cressy' is not vulgar, she is nothing. Howells succeeds in doing it, but then he has a genius for this kind of writing, and would by this time have founded a school, except that he is literally inimitable. Bret Harte, in his earlier stories, struck a new Western vein, which, while it lasted, was very rich. Now his literary ventures seem to be of a "prospecting" turn, and the yield of "pay ore" to be less. The facility of narrative, the power of sympathy, the pathos and humor, all are here; but the incidents are improbable, the characters are invented and put together rather than created or drawn from nature, and the result is neither a photograph nor a romance.

Mr. Pollock's volume consists of nine stories, one of which, "Edged Tools," is the joint work of Mr. Pollock and Mr. Brander Matthews. Of these the most ambitious is "Lilith," which is also perhaps the most successful. They all deal more or less with the supernatural, and in this they show the author's naïveté, if not his wisdom. There is no field more tempting than the border-land between the real and the unreal, and none more dangerous, because the world is of a sceptical turn nowadays, and does not readily admit the existence of a personal devil or disembodied spirits, except as a matter of religious dogma. It will do for Sunday and church, but hardly passes muster in fiction, except when managed with skill amounting to genius. It is no reflection on Mr. Pollock to say that he had far better try some other field. He evidently has plenty of ability as a story-teller if he will, let us say, renounce the devil and all his works.

Of all the books that have been written with the purpose of ameliorating the condition of women, there are few that will prove more effective upon the mind of the average voter, with whom the decision of the question finally rests, than 'Our Uncle and Our Aunt.' The dry bones of argument and fact are thrown into the form of a lively tale, in which Uncle Sam and his wife—has he hitherto been supposed to be a bachelor?—play a conspicuous part; and the nearly impossible feat is accomplished of awakening an interest in characters which exist for the purpose of carrying on a discussion. The warmth and fervor of the pleading, and at the same time its restraint and moderation, commend it to every lover of good argument; and the skill with which government is personified in the person of a good-natured, unthinking, tyrannical old fellow, who has no idea that his wife cares for any separate existence of her own, lends that concreteness to the presentation of the case which reasoning must have if it is to produce any effect upon minds unaccustomed to abstractions. The book is said to have been written many years ago, and some of the legal abuses which it dwells upon have been remedied in some States of the Union, but none in all, and some in none. There is no reason to suppose that anything less than universal suffrage will make it lose its effectiveness.

The aunt begins by being a gentle and timid woman, quite incapable of opposing her husband in anything. "Marriage had made that couple one, and that one was my uncle. So fully was his wife's identity lost that she was never individualized by her own name, but simply called Aunt Sam." By degrees she gains courage, and even ends by making a public speech on the subject of women's voting. The following quotations will show the scope of the book:

"'If a woman had the ballot, she would only duplicate her husband's vote.' And if she did, what is the harm? Do not fathers and sons do the same, and is either disqualified on that account? 'A woman would *not* vote as her husband, and thus the home would be broken up.' The last century has established the fact that woman can endure all kinds of political differences and persecutions without leaving her home. Are we to understand, then, that man cannot submit to a fair political expression from woman? Is her nearest friend, protector, and *fair representative* unable to tolerate her honest convictions?"

"'But, honest, now,' said Uncle Sam, in a confidential, half-persuasive manner, 'wouldn't you be happier with a home of your own and your husband and children around you?' 'That, sir, if you'll think, is an impossible combination; for a woman with a husband cannot have a home of her *own*.'"

In a dream of the American heaven the very amusing idea is carried out of finding the women subject to the same disabilities which they enjoy on earth. "The speaker raised a neatly folded pair of wings and soared lightly around me, keeping close to the ground. 'You see the women's wings are always clipped. It is a wise provision of the law, our guardians say, as otherwise we might fly too high for our own good.'" The whole sad tale of woman's wrongs can hardly be put in a more moving form than this.

Pen and Powder. By Frank B. Wilkie. Boston: Ticknor & Co. 1888.

THIS book is not history, and does not claim to be. It is a compilation of independent articles forming a clever and entertaining combination of history, biography, and fiction. The author thinks that justice has not been done to the abilities and services of the newspaper correspondents who accompanied the Western armies during the war of the rebellion, and his main purpose is to apply a remedy by giving his own experience, and making the public better acquainted with his brothers of the pen. To that end, he says, he has made an effort to recall a class of events and the labors and personality of men concerning whom history and biography have been silent. Twenty-seven of his brethren are mentioned, the biographical sketches of many being excellent. Excellence, however, cannot be predicated of the sketches of distinguished soldiers. Grant, for example, is described as "a dark, thickset man" having "bright brown eyes," whereas Grant was not dark, not thickset, though compactly built, and had blue eyes. Indeed, neither Grant nor his services were seen aright by the author. Taking all the circumstances into consideration, the march from Fort Henry to Fort Donelson has been regarded, and was in fact, a creditable operation. But the author says of it: "The surrender of Fort Henry took place on February 6; on the 12th, six days later, the army of Gen. Grant had crossed the intervening space of eleven miles and environed Fort Donelson. Few such marches are recorded in history; none that I can recall in which less distance was made in more time. It must be regarded as unrivalled." The author qualified himself for criticising this mud march through snow and sleet by making it on a boat which steamed comfortably down the Tennessee and up the Cumberland. For the troops, however, whose march he says was so slow, the weather was "savage." The companies "had not brought their tents, and there was no protection whatever against the ice, snow, and chill winds that took possession of the region."

Speaking of the attack on Fort Donelson, the author says: "On Friday I had wandered around the line of Federal investment, trying to find Grant, but failing constantly. He was not at his headquarters; he was not apparently anywhere," etc. The trouble was, Grant did not know the correspondent was looking for him. If he had known it, surely he would have been "apparently" somewhere. To tell the whole story, Grant, knowing that a crisis was approaching, was looking for the correspondent, and instinctively galloped down to one of the steamboats to find him. As bad luck would have it, the correspondent had just gone ashore. Learning that, Grant let the battle go on. Fortunately, the troops, busy fighting, were wholly unconscious of the game of cross-purposes between their leader and their follower, and no serious consequences resulted.

The book shows no love for the Union cause or for the Union generals, except, perhaps, for McClellan, Steele, and Sturgis. The author says he assured the rebel prisoners at Fort Donelson that they would be soon exchanged or paroled, but that he was mistaken. "They were," he says, "needed to grace the triumph of a conqueror," and notwithstanding it was "savagely cold, and they were without proper covering, they were sent mainly to Chicago, where they stimulated an apathetic patriotism, and thousands of them left their bones in an indistinguishable grave near the site of Camp Douglas." There is no lack of sympathy in the book for suffering Southerners.

In July, 1862, the author "went to Washington in the interest of the Chicago *Times*." Those who remember the course which the Chicago *Times* took during the war will not be surprised to find this book speaking of Seward's "little bell," of the Washington "bastile," and saying:

"Washington, at the time I went there, was a cesspool into which drained all the iniquity and filth of the nation. It was filled with runaway negroes, contractors, adventurers, office-seekers, gamblers, confidence men, courtesans, uniformed officers shirking duty, and the riff-raff, the offscourings of all creation. Except Whitelaw Reid and Ben Perley Poore, the correspondents stationed there were nobodies. Universal drunkenness prevailed. Drunkenness, gambling, and other debasing habits were the occupation, the amusement of residents and visitors. Seward's little bell was tinkling at brief intervals, and the old Capitol Prison had its due quota of inmates."

Properly enough, the writer for the Chicago *Times* "determined to return to the West, where there was something for a correspondent to do besides playing poker and being smothered by a press of courtesans, filthy contractors, shoulder-strapped military men, and all the other disreputable and disagreeable characters that made the large majority of the population of the capital." Of course the determination to leave this Sodom and go West was brought about by the moral sense of the Chicago *Times's* correspondent, and not by the sound of Seward's little bell.

The author tells with remarkable clearness how Junius Henri Browne, then in St. Louis, wrote and the New York *Tribune* published a full and graphic account of the battle of Pea Ridge, which Browne did not witness, and about which he knew nothing. A large part of Browne's work is quoted "as a specimen of what can be done by a vivid imagination on the slim foundation of one fact and a rumor—the former that Sigel was with the Federals, the latter that there had been a two-days' battle resulting in a defeat of the enemy." With Browne's performance before us, we are told by the author that "it is but justice to the correspondents to admit that, without their aid, the battles of the late war would never have been fully known by the public."

'Pen and Powder' throws many side-lights upon war history. Among other things, it shows that steamboats played an important part in the military operations in the West. Their berths afforded accommodations to cor-

respondents, their cabins presented ample opportunities for observing draw-poker, and their decks were good sites from which to view the foolish manœuvres, the slow marches, and the useless slaughter of the Union troops in the surrounding theatres of war. Certainly a strong case may be made in favor of the functions of war correspondents in general, and of the services rendered by some of our correspondents in the late war; but it can hardly be said that it has been made in 'Pen and Powder,' though the book is entertaining.

Memoir of William Ellis, and an Account of His Conduct-Teaching. By Ethel E. Ellis. Longmans, Green & Co. 1888.

THE growth of the movement for popular education in England was largely the work of undistinguished practical reformers, who spent less time in agitation than in humble efforts of their own to teach the children whom they could reach. They used the pen also, but rather to make known their methods actually in operation and to explain their ideas than to induce the Government to do an undetermined something which, if it were done, might be a panacea. William Ellis has an honorable place among these men, and his career, bare as it is in ordinary biographical interest, is a lesson in practical charity well worth wide promulgation. He belonged to that class of Englishmen, of which this century has been fruitful, who have done more for the actual improvement of their fellow-men than many whose names are widely known as public men—the class of social reformers. Of French and Italian descent, he was the son of a London merchant, and while still under thirty entered the service of one of the first marine-insurance companies, was given its management when it was near ruin, made it a great financial success, and remained occupied with its business until his death at the age of eighty-one. He married the daughter of Sharon Turner, and lived frugally. "Others," he said, "may keep a carriage; I prefer to keep a conscience." He became rich, and maintained that high standard of commercial integrity which characterized his entrance on his important duties. He it was who, when there was some question raised, on occasion of a fire at the docks, whether marine insurance operated until after a ship had left her moorings, paid the claims and forced other companies to the same course. Once he paid a claim on a lost vessel merely because the owner incidentally stated that the policy had not been renewed by the oversight of a clerk. His conduct towards employees was similarly characterized; and when the company offered him a present of £10,000 a year over his salary, he refused to accept it unless the payment of all the other employees down to the porters was similarly raised.

It is not as a business man, however, that he is remembered. He was one of the group of young men who derived from Bentham. He early knew the Mills, and was a member of the two debating societies founded by the younger Mill, which were schools of political and social thought. At what age he began to be deeply moved by the sight of the poverty of the lower classes is not stated; but he came to the conclusion that it was largely preventable, and that the means to forestall it was the formation of character in the young by means of education in moral duties. Parental improvidence, largely induced by ignorance, was the cause; parental forethought was the cure. For the academical education he had a kind of contempt. His attitude towards it is illustrated by two stories: one of a lady who asked him to recommend a Spanish teacher for her daughter, already mistress of many languages, but no knowledge, and who received the reply, "Don't you think it would be a pity to give her another opportunity of advertising her ignorance?" and the second, of a gentleman consulting him about his son's education, who was sarcastically told that Mr. Ellis supposed that he would send him to some place where he would learn how it took Ulysses ten years to go from Troy to Ithaca with the aid of the gods, and would not learn how the voyage could be made now in twenty-four hours without their assistance. He was, however, not a bigoted reviler of classical and refined education. But he held that education was distinctly lacking in the essential points of inculcating rules of conduct for practical life, and in general in forming character. Conduct-teaching was his fixed idea; without this the rest was of little consequence.

He put his own hand to the work only when he was forty-six years old. He then assisted in opening schools in connection with some of the Moral-Suasion Chartists, principally that at the National Hall, Holborn, and those called the Birkbeck Schools in London, though he also gave aid and counsel to those started in the country. He himself, one of the busiest men of the city, where he spent all day, taught several evenings a week for years; he wrote, also, many text-books, and beyond this he contributed many thousand pounds from his private fortune. These schools included in their system the monitorial idea and object-teaching, and they were entirely secular. He was, moreover, a propagandist. He gave lectures at South Kensington and elsewhere. He at one time taught four of the children of the Prince Consort. At no time did he lose any opportunity of serviceableness or of spreading his projects. The results were highly satisfactory, until the Board Schools of London and the general progress of popular education relieved the necessity for such private efforts. It is to be said, too, that William Ellis kept himself out of public view in these benefactions—possibly because of the prejudice against secular education, proceeding from the ministers and clergy, and consequently directed against him personally as a well-known secularist. The portions of the biography which detail his ideas upon moral teaching—and it was only for this that he cared—and which illustrate the workings of his system of instruction, are of high value to such as are specially interested in this important and difficult element in popular education. Ellis's style is entirely destitute of charm, but his mind was full of clear sense.

It was impossible that a man of his convictions and his thorough knowledge of political economy should not think much of the larger question of the relation of the rich and poor. The sight of the use of riches in England affected him with the same directness as that of the destitution of the poor. His whole mind was bent on the problem of diminishing the sum of poverty, and all that poverty entails, in the world. He did not indulge socialistic ideas; but he found nothing surprising in the rising tide of that discontent which is willing to pull wealth down into the ditch with the poor, even though nothing come of the destruction. His view was, that the wealthy are to be allowed for as the poor are, by considering that their errors are equally the results of ignorance of their duties induced by insufficient moral training in social obligations. His more distinct criticism upon them is as follows: "The prevailing styles of living among the wealthy in the midst of privation cannot be reflected upon with unmixed satisfaction even by themselves. It may be given in to—it may be submitted to—it may be conformed to—it may be revelled in—but it CANNOT BE JUSTIFIED." The waste of riches, however, was in his mind only incidental, like indiscriminate charity. The security of property he regarded as the condition of industrial virtue, the underlying ground of those qualities of honesty, frugality, and application which are most important to well-being in the present age. Reform must proceed, he held, by efforts to prevent in individuals the improvidence to which social evils, in his opinion, were mainly due. He was naturally a Malthusian, but commonly he kept his views upon this subject inconspicuous, the state of popular thought being unfavorable to discussions of this sort. Taken altogether, his thoughts upon social conditions have the weight which belongs to a man acquainted with political economy, interested actively in philanthropy, and bringing to the subject a mind trained in business affairs. It is unfortunate that he did not leave some more adequate literary record of his convictions; but he had not the gift to write. His public service is his only memorial, and to it this biography is confined.

The Cruise of the Marchesa to Kamtchatka and New Guinea. By F. H. H. Guillemard, M.D. New ed. Scribner & Welford. 1889. 8vo, xvi, 455 pp. Maps and illustrations.

THE *Marchesa*, an auxiliary screw schooner yacht of 420 tons, owned and commanded by Mr. C. T. Kettlewell, left England in January, 1882, and proceeded by the Suez Canal route to Ceylon, Singapore, Formosa, the Liu-kiu (better known as Loo Choo) Islands and Japan. Between July and October a visit was made to Kamtchatka. In the spring and summer of 1883 explorations were made among the little known islands of the Sulu Archipelago, and some time was spent in visiting the territory of the North Borneo Company. Later the yacht touched at Sumbawa, Celebes, and other Malaysian islands and at various points in Dutch New Guinea, returning to England in April, 1884.

The objects of the voyage, besides the satisfaction of visiting new and little known parts of the Eastern world, were combined in a judicious mixture of sport and scientific research. Such an opportunity for study, recreation, and adventure would seem to offer the *ne plus ultra* of a naturalist's desires. Several such voyages of British yachtsmen have been recorded in book form during the last few years, and have contributed to the entertainment and instruction of thousands of readers. Lady Brassey's charming journals may be cited as a conspicuous example of this growing department of literature. The present volume is a second edition differing from the original two-volume edition in the omission of an historical chapter on Kamtchatka, of sundry technical appendices, and two colored plates. It practically furnishes the general reader all that the first edition contained of popular interest. It is beautifully printed and the illustrations are of the first quality. The text is admirably written—clear without formality, entertaining without flippancy, amusing, yet free from slang.

It would be, of course, impracticable to attempt any summary of the book as a whole which should do it justice. The voyage, which serves as a thread upon which are strung descriptions of Oriental scenery and people, of the striking features of the flora and fauna, is discreetly kept in the background, yet is sufficiently prominent to give the needed unity to the narrative. Among the most interesting bits of description is the account of the eastern shores of Formosa, which tower seven thou-

sand feet or more above the waves in nearly vertical cliffs. These walls are nearly one-half higher than those of the Yosemite, and rise abruptly from the sea. Here and there at the mouth of some cañon is spread a short beach of boulders where a landing in the dry season may be had. In the wet season these openings discharge a prodigious amount of drainage, and at this time the whole coast is practically inaccessible. Another chapter which will be read with more than common interest is that which tells of the journey in Kamtchatka from Avatcha Bay through the interior and down the Kamtchatka River to the sea. We believe this to be the fullest and best account of the sublime volcanic peaks of the peninsula, where these orographic marvels reach a development varying from twelve to seventeen thousand feet in altitude. Within the same area elsewhere such an assemblage cannot be paralleled either in number, height, or perfection of conical form.

The book is an example of thoroughly good workmanship throughout, and we heartily commend it to our readers.

A Treatise of Elementary Biology. By R. J. Harvey Gibson, M.A., Lecturer on Botany in University College, Liverpool, etc. Longmans, Green & Co. 1889.

When Huxley and Martin, thirteen years ago, published their 'Practical Biology,' they opened up a method of study in biology, long pursued in Germany, which had not before received much encouragement from the English-speaking student. It was the introduction of exhaustive practical work, limited to a comparatively small number of organic types, in place of the discursive general treatment which, in a short college course, was supposed to cover both the animal and vegetable kingdoms. The biological student of to-day cares but little for old-fashioned zoölogy—indeed, he spurns the acquaintance of species and genera with a vigor only equal to that which was applied towards the acquirement of this knowledge by his predecessors. Morphology, histology, and embryology have all but usurped the place of systematic zoölogy and botany. In this departure from the beaten path of study, which has borne rich fruit, it can be plainly seen that the pupil has outstripped the master. While the latter was content with legitimately combining the new method with the old, the former has largely restricted himself to the one method alone. It is no longer ignorance for a naturalist not to know the name of a plant or an animal, but something in his favor; it is ignorance not to know from which tissue a certain organ originates, or in how far the vertebræ of a bird or reptile are, or are not, "homologous" or "homonomous" with the corresponding vertebræ of a fish or a quadruped. It is ignorance not to know the different phases of embryonic development of a given individual, but a knowledge of habits, of the relation which the individual holds to its surroundings, and of geographical distribution, is not considered absolutely necessary.

It is difficult to estimate the balance of good or bad that has resulted from this method of inquiry. That it has opened up a vast field of research, and of research of the highest order, cannot be questioned; but, at the same time, it is apparent that, at least to a certain extent, it is substituting a microcosm for a macrocosm. It narrows the mind to a contemplation of objects which are largely visible only under the microscope, and hides that which is apparent on the surface. We do not wish to be understood as undervaluing this form of research, for the light it has thrown upon certain phases of life and construction is in the nature of a revelation, but we believe that a too close and exclusive adherence to its methods is harmful, and destructive to the broader philosophic conception of the organic world. We are apt to miss the thread of nature in grappling with particles, and liable to the misconception that the construction of the universe is merely an embodiment of the construction of its entities, and nothing more.

The little volume before us is an exposition of the new school of biologists; it is an addition to literature which has developed from the germ sown by Huxley and Martin. Like all text-books of science which have been prepared with a certain amount of care and under the guidance of a fairly equipped student, it has something to recommend it, and will be found serviceable by a large number of students. But, like a host of other books which, without the aid of a master's mind, have been given to the world with the purpose of "filling a place" seemingly not yet occupied, it has its deficiencies and inaccuracies, and these, in the present instance, suggest the query, For what purpose was this book written? We are informed by the author that his principal motive was to acquaint the biological student with certain facts and conclusions of physics and chemistry which are considered essential to a proper appreciation of biological study, and to point out the dependence of biology on these two branches of physical inquiry. For this purpose we are furnished with preliminary dissertations on "Matter," "Energy," the "Classification of Chemical Compounds," "Laws of Chemical Change," the "Composition of the Atmosphere," etc. Whether the introduction of these features was a sufficient excuse for the publication of a work which has otherwise nothing specially distinctive about it, and which, from a narrowness of preparation, has but little to recommend it as a school-book—for which it is intended—may be a matter of diversity of opinion. To us, even with its added features, the book appears in no way superior to others that have preceded it.

Of what advantage, for instance, can it be to the biological student or any one else, to be told that "matter is divisible, but not infinitely so (save in imagination)"; that "practically, and even theoretically, there are limits to the divisibility of matter"; that "the practical limits of the divisibility of matter are soon reached"; that an atom "is itself indivisible by any means at present in our power"; or that "nearly every molecule is composed of two or more atoms"? What kind of proof, or semblance of proof, can be furnished for these assertions? It certainly seems unnecessary to trouble the biological student with considerations in other departments of science which are wholly of a theoretical character. Objection can also be made to the unnecessarily free use of strictly technical terms, and to the habit, prevalent with many biologists, of coining a new word for almost every process that takes place in nature. The following construction (p. 34) will illustrate the barbaric condition, if we may so term it, into which "elementary" biological language is drifting: "Changes concerned in the building up of protoplasm will therefore constitute *constructive metabolism* or *anabolism*; while the changes which take place in the decomposition of protoplasm may be termed collectively *destructive metabolism* or *katabolism*. The products of anabolism and katabolism will therefore be naturally *anastates* and *katastates* respectively."

For the rest of the book little need be said; it contains the usual good points and bad points that belong to books of its kind. Considerably more than one-half of the systematic portion deals with the anatomy and physiology of plant-life. The types illustrating the animal kingdoms are only Protamœba, Amœba, Obelia, the earth-worm, the lancelet, and the frog. How this limited selection can adapt itself to the requirements either of the college student or of the self-taught, it is difficult to understand. A text-book on biology with two of the more important groups (Crustacea, Mollusca) of the animal kingdom wholly ignored is, in one sense, certainly elementary. The illustrations are numerous and for the most part distinct.

Historic Families of Kentucky. First Series. By Thos. Marshall Green. Cincinnati: Robert Clarke & Co. 1889.

The three families treated of in this volume are the McDowells, the Logans, and the Allens, all three Scotch-Irish, a race which the author (for many years an editor at Maysville, more lately a correspondent for the Cincinnati *Commercial Gazette*) greatly admires for its stubborn combativeness. The writer of the book yields them nothing in this virtue, and is noted as the best hater in Kentucky. He invited, to his cost, a famous libel suit in 1879, and in 1887 he had a "personal difficulty" with a Democratic politician, which he survived. The book is most unreadable to the public at large, though the Kentuckian who knows many of the more than five hundred men and women named in the three hundred pages, either personally or as the parents and grandparents of his personal friends and acquaintances, will feel a passing interest in turning over the pages, and glancing at the account of well-remembered incidents. There is not enough said about any one man to make him even the hero of the moment, to call forth an interest in him that was not felt by the reader before. Nor is any art shown in giving substance to men who, in themselves, are hardly more than airy nothings. Thus, of Ben. Hardin Helm, son of Gov. John L. Helm, nothing is said but that he was born in 1831, graduated at West Point, studied law, joined the Confederate army in 1861, fought gallantly in it, rose to be general, and was killed at Chickamauga in September, 1863. The author of the book has ever been a strong Union man. Still, he nowhere states in so many words that Ben. Hardin Helm was the brother-in-law of Abraham Lincoln, only allowing it to be inferred from an account of the marriages of Robert S. Todd's daughters. He does not tell us that Helm was about to be nominated in the summer of 1860 for a great State office, in order to bring out and concentrate the Union sentiment of the State against the Breckinridge Democracy; that this near connection with Lincoln, the Republican nominee for the Presidency, made him "unavailable"; that after Lincoln's accession to office, Mr. and Mrs. Helm visited Mr. and Mrs. Lincoln at the White House, spending several days there; that Lincoln offered to appoint his brother-in-law a paymaster, and to send him off to New Mexico, which he declined; that from having been a strong Union man he was gradually drawn to the other side by the influence of his father, who, contrary to the Whig traditions, was intensely hostile to the Union cause.

The book thus lacks the attraction to the general reader which would arise from connecting its dreamy figures with the best known historic names and events—barring the old stories about Aaron Burr, told and heard quite too often already. It also lacks the charm of

light and shade. The frailties of the men of his three great families are kept out of sight. We do not learn how many of them drank themselves to death (the percentage cannot have been small); how many were killed in a brawl growing out of a game of poker, etc. In short, the book is not at all racy. It was probably written, mainly, to be bought by the many living persons whose names occur in it, and by the sons and daughters of others now dead; and, in the memorable words of Mr. Lincoln, "for those who like that sort of a thing, it is just the sort of thing they will like."

How Men Propose. The Fateful Question and its Answers. Love Scenes from Popular Works of Fiction. Collected by Agnes Stevens. Chicago: A. C. McClurg & Co. 1888.

When a woman reads a novel, it is said that she always turns at once to the chapter containing the proposal—that being for her the real centre of interest in any book. The author of 'How Men Propose' has evidently manufactured her book on the theory that, if a woman likes to read one proposal in a book, *à fortiori* she will enjoy reading a hundred. Accordingly, she has selected the proposal scenes out of a hundred well-known, or not so well-known novels, and classified them under various heads—as, "the successful proposal," "the humble proposal," "the resultless proposal," and so on. The result is a very cloying book. It is not true—at least to our taste—that because a proposal is interesting, what a commercial traveller would call a "full line" of proposals is attractive. On the contrary, reading about proposals is altogether too much like eating candy: a surfeit produces indigestion and disgust with life. Moreover, our compiler seems to have overlooked the fact that, disconnected from the story, a proposal is to a great many minds rather uninteresting. It is what leads up to the grand climax—our previous acquaintance with the characters—that gives a zest to their love-making.

Nevertheless, to the student of human nature and lover of his kind, such a collection will suggest a good many curious inquiries. If such a work were exhaustive enough, it would give us a complete natural history of love-making, which might be made a basis of one branch of what Mr. Mallock calls the science of human nature. But then it would have to be very encyclopædic, and would have to embrace all races and tribes, times and countries. Anglo-Saxon courtship is only a small part of the whole field. And it is curious, by the way, to notice—judging from the collection before us—how simple and unsophisticated Anglo-Saxon love-making is, compared, let us say, with that of the French novel. The dread which the English or American lover always has lest he shall abandon himself to his feelings, gives his proceedings an air of reserve which, to a woman of another race, would seem very strange. But then, fortunately, in these matters, the attitude of the woman is adapted to her environment; and no doubt, from the primitive period when a stout club was the most cogent argument in a marriage proposal, women have always reconciled themselves to the facts of their situation.

A Selection of Cases on the Law of Quasi-Contracts. By William A. Keener, Story Professor of Law in Harvard University. 2 vols. Cambridge: Charles W. Sever.

The familiar term "implied contracts" is ambiguous in that it includes contracts implied in fact, which are true contracts, with certain obligations which are enforced by the law as if they were contracts, though they lack essential elements of true contracts. Prof. Keener's adoption of a distinctive name for implied contracts of the latter kind is in the interest of clear thinking and sound reasoning on legal subjects. Those who cling to the ancient ways may be helped to overcome their distaste for innovation by noticing that the Supreme Court sanctions the use of the term *quasi*-contract (Steamship Co. vs. Joliffe, 2 Wall., 450).

The cases here selected, about four hundred in all, are arranged in chapters so as to bring out in sharp relief the legal principles contained in them. The first chapter treats of the nature of the obligation and the differences between it and contract and tort. The second chapter covers failure of consideration in cases of mistake, non-performance of contract by the defendant, and non-performance by the plaintiff of a condition of contract. In the remaining chapters the topics illustrated are benefits conferred without request, benefits conferred at request but not in the creation or performance of a contract, recovery of money paid under compulsion, and waiver of tort. The work ends with a carefully prepared index, in which a simple typographical device distinguishes *dicta* from decisions.

The absence of a summary of the whole matter and of headnotes to the individual cases is a serious hindrance to the use of the book by lawyers in active practice. But the want of headnotes could not be supplied without sacrificing the primary purpose of the author, which was to provide a book that could be used in the Harvard Law School in accordance with the method of instruction which Prof. Langdell brought into vogue. One of the characteristic, and not least valuable, features of that method is, that it requires the student to dig out for himself the questions involved and the reasons of decision in each case, and to state the result of his labors in the class-room, subject to the criticism of his fellow-students and the instructor. A summary of all the cases might, consistently with the limitations of the system of instruction, have been added; but this, we are told in the preface, is reserved for a treatise on the law of Quasi-Contracts. A cursory comparison of these cases with the parts of the standard text-books which purport to cover the same ground, is enough to convince any one that such a treatise is needed. Coming from the hands of a skilled workman, there can be no doubt that it will be of exceeding benefit to lawyers and judges.

BOOKS OF THE WEEK.

Annual Statistician and Economist. 1889. Illustrated. San Francisco: L. P. McCarty. $4.
Balzac, H. de. Bureaucracy; or, The Civil-Service Reformer. Boston: Roberts Bros.
Beaufort, Duke of. Driving. Illustrated. Boston: Little, Brown & Co.
Bennett—Murray. A Handbook of Cryptogamic Botany. Illustrated. Longmans, Green & Co. $5.
Bourrienne, L. A. F. de. Memoirs of Napoleon Bonaparte. New and revised ed. Illustrated. 4 vols. Chas. Scribner's Sons. $5.
Brown, C. A New Method of Conversation and Correspondence in the French Language, for Business Men and Schools. Boston: Carl Schoenhof.
Burnett, Frances Hodgson. The Pretty Sister of José. Chas. Scribner's Sons.
Callendar, H. L. A System of Phonetic Spelling, adapted to English. Macmillan & Co. 15 cents.
Campbell, Helen. Prisoners of Poverty Abroad. Boston: Roberts Bros. $1.
Chisholm, G. G. Longmans' New Atlas, Political and Physical, for the Use of Schools and Private Persons. Longmans, Green & Co. $4.
Crawford, F. M. Greifenstein. Macmillan & Co. $1.50.
Darmesteter, Prof. J. Shakespeare. [Classiques Populaires.] Paris: Lecène & Oudin.
Desdevises du Dezert, Prof. G. Don Carlos d'Aragon, Prince de Viane: Étude sur l'Espagne du Nord au XVe Siècle. Paris: Armand Colin & Cie.
Dobson, A. The Poems and Plays of Oliver Goldsmith. Etchings by John Jellicoe and Herbert Railton. 2 vols. Macmillan & Co. $3.75.
Draper, L. C. An Essay on the Autographic Collections of the Signers of the Declaration of Independence and of the Constitution. Revised and enlarged from the Wisconsin Historical Collections. Burns & Son.
Dupuis, Prof. N. F. Elementary Synthetic Geometry of the Point, Line, and Circle in the Plane. Macmillan & Co. $1.10.
Graves, J. A. The School Hymnary. Charles E. Merrill.
Harris, Rev. S. S. Select Sermons. Chicago: A. C. McClurg & Co.
Higginson, T. W. The Afternoon Landscape: Poems and Translations. Longmans, Green & Co. $1.
Hillard, Katharine. The Banquet (Il Convito) of Dante Alighieri. G. P. Putnam's Sons. $2.25.
Howard, Blanche Willis. The Open Door. Boston: Houghton, Mifflin & Co. $1.50.
Jastrow, M. A Dictionary of the Targumim, the Talmud Babli and Yerushalmi, and the Midrashic Literature. Part III. G. P. Putnam's Sons. $2.
Lang, A. Letters on Literature. 2d ed. Longmans, Green & Co. $2.
Lang, A. Lost Leaders. Longmans, Green & Co. $1.50.
Leffmann—Beam. Examination of Water for Sanitary and Technical Purposes. Philadelphia: P. Blakiston, Son & Co. $1.25.
Lightner, Adna H. Shadow and Sunshine. George Munro.
Linton, W. J. Poems and Translations. London: John C. Nimmo. 12s. 6d.
Livermore, Mary A. My Story of the War: A Woman's Narrative of Four Years' Personal Experience in the Sanitary Service of the Rebellion. Hartford: A. D. Worthington & Co.

Address X. Y., *The Nation.*

MISS A. C. MORGAN, PRINCIPAL of Young Ladies' School, Portsmouth, N. H., announces her annual vacation trip to Europe, including Norway, Sweden, and Denmark.

The Nation.

NEW YORK, THURSDAY, APRIL 25, 1889.

The Week.

THE appointment of Robert P. Porter as Superintendent of the Eleventh Census is perhaps the most unfortunate nomination yet made by President Harrison. Mr. Porter is a renegade Englishman, a renegade free-trader, a renegade member of the Tariff Commission of 1882-3, and a man of indifferent repute in other respects. The contrast between him and Gen. Francis A. Walker, the Superintendent of the Tenth Census, is so glaring in every way that the two would never be mentioned in the same breath by any person of scientific training or possessing technical knowledge of the work that the census involves. It is not because Mr. Porter is a protectionist that he is objectionable as Superintendent of this great decennial work. Everybody knew that a protectionist would be appointed. Everybody, we might say, was agreed to that. But Mr. Porter is a protectionist for revenue only. He has shown very clearly that he has no convictions. He has doubled on his own track twice, and he has slandered his native country in a series of letters written for pay. A census taken under such superintendence is discredited in advance in important particulars, and the money spent upon it will be to a large extent wasted, because the results arrived at will not be generally accepted. The Superintendent of the Census holds a quasi-judicial position, and it is of the first importance that he should have gained a reputation for judicial qualities of mind and character. Mr. Porter's reputation is that simply of a soldier of fortune.

How great the misfortune of his appointment is for the country can be inferred from the fact that all discussions of an economical character—all which have to do with the material well-being of the nation—are based upon the decennial census. Originally the census was merely an enumeration of the people as a basis of political representation. It has grown to be the statistical book of the nation's industries, religion, education, taxation, and social organization in general. It is the universal almanac and encyclopædia to which our own people and foreigners turn as to the authority of last resort, either to decide questions of dispute, or to sustain theories, or to gain light in new investigations of social and industrial phenomena. To throw doubt upon such a work before it is begun, to discredit it in the minds of those who are most competent to extract the truth from census-tables, and commend it to less discerning readers, is something which the Senate ought not to sanction.

"Something equally as good" to Tom Platt as a seat in the Cabinet is a contract with the Treasury Department making the United States Express Company (T. C. Platt, President) the exclusive agent of the Government for the transportation of all its moneys throughout the United States, and assigning to said express company rooms in the Treasury Department building at Washington for the transaction of their business. The Buffalo *Courier* publishes a circular letter signed by Platt, in which this contract is described. The Government service has heretofore been performed by the Adams Express Company under a contract made during President Grant's Administration. The contract has not been considered a part of the political spoils heretofore. We do not know any reason why it may not be performed as well by one company as by another. We note the circumstance that Platt has been provided for, with some hope that he may be satisfied with his own plum and stop "bossing" the patronage of New York, and let Mr. Warner Miller's friends have "something equally as good."

Although "Mr. Whitelaw Reid, having taken office abroad under the Government," has retired "from the editorship and direction of the *Tribune*," that journal on Sunday showed all its familiar maladroitness by stepping into the Wanamaker & Brown scandal of the circular to country postmasters, in utter unconcern of what its co-apologists might be doing about it. The *Tribune* said "that Mr. Wanamaker sold out his connection with this house several years ago, the retention of the firm name representing his brothers, and that he has no actual connection with the business." But Messrs. Thomas B. Wanamaker and Robert C. Ogden of Philadelphia say: "We desire, as the partners of John Wanamaker in the firm bearing his name, to state that Wanamaker & Brown constitute a limited company, in which John Wanamaker is simply a stockholder, not even an officer." And the Postmaster-General himself says: "I hold a little stock in it." This is all that anybody has alleged as the ground of charging indecency in the issue of the circular to the Postmaster-General's subordinates. The characteristic *Tribune* touch, however, is the final remark that the circular "was prepared and sent out before the election, when there was no assurance that Gen. Harrison would be elected, or that, if elected, Mr. Wanamaker would be his Postmaster-General." It is dated "April 8th, 1889."

The truth is, that for thick-and-thin partisans this is a clear case for application of the saying, "The least said the soonest mended." With such an odious little scandal, the thing for them to do was to keep silence, and trust to the rush of events and short memories. But misfortune seems a property of the Administration which is just beginning to make itself known. Perhaps no man ever came to the first office of the state with greater advantages than attended Mr. Harrison. Mr. Cleveland's course had made easy for him some ways of wise administration which otherwise would have been difficult. His political opponents in the late campaign received him with open minds, ready and even eager to discern in him intelligence in modern and reasoned methods of statesmanship, and honest purpose to fulfil his public engagements. This disposition was sincere, for the wish was father to the thought, and it could have been changed into firm regard and liking by a course falling far short of ideal capacity and honesty. A little good intent, some tact and management, and a run of luck, would have gone far to establish the Administration firmly in the regard of the people who greeted it so hospitably. But it has had none of these things. The first two it has chosen to do without, but nobody willingly exorcises luck, even if there were any known way of doing that, and the most striking feature of Mr. Harrison's rule up to this time is want of luck. To take the present moment for example, not often can an Administration have on hand at once a vulgar, sordid scandal like the Wanamaker & Brown circular to postmasters, and a great, tragical blunder like turning out of the New York Post-office that dying man, to put a Republican "Boy" in his place, just as his disease was taking its sudden fatal turn. A few more days of squabbling over the New York spoils would have seen Mr. Pearson die untroubled, and would have made it possible to believe that the Administration would have been glad to keep this eminent public servant in the place which he dignified.

Mr. Cleveland not only allowed Republican postmasters in Massachusetts to serve out their terms, but in more than one case reappointed an incumbent who had been efficient in the discharge of his duties and had not been offensive in his partisanship. The first test of what Mr. Harrison would do under similar circumstances was presented in the case of Mr. Couch, Postmaster in the college town of Amherst. He has been a most faithful public servant, and has conducted the office on the principles of civil-service reform, retaining all the assistants and clerks of his predecessors, save where illness necessitated retirement. His reappointment was asked for by nearly the entire faculties of the two colleges and by the leading business men, including the President of the National Bank and the proprietors of the mills, two-thirds of these being Republican in politics. In short, it was eminently a case for the application of the sound principle laid down in Mr. Harrison's letter of acceptance when he said:

> "In appointments to every grade and department, fitness and not party service should be the essential and discriminating test, and fidelity and efficiency the only sure tenure of office. Only the interest of the public service should suggest removals from office."

But the Republican politicians insisted upon Mr. Couch's removal, in order to provide for

a party-worker, and "fidelity and efficiency" counted for nothing.

The overwhelming majority cast by the voters of Massachusetts against the proposed prohibition amendment to the Constitution on Monday is a reverse to the movement from which it is not likely to recover for many years. All the circumstances combined to render the verdict in the highest degree significant of the decision which the people have reached as to the best present method of grappling with the drink problem. Massachusetts is a State where public questions are still discussed seriously by the press, and where there is an exceptionally large percentage of voters who put conscience into their ballots. The slow processes of constitutional amendment, which require the endorsement of two successive Legislatures before a change in the fundamental law can be proposed, have kept the question before the public mind for two years, and there has been an animated canvass during the weeks which have passed since the present Legislature ratified its predecessor's action and fixed the day for the election. The result thus represents the deliberate verdict of a community which may still justifiably boast of a remarkably high average of popular intelligence.

In round numbers, the vote of the State was 88,000 for the amendment to 132,000 against in a total of 220,000, or not quite two-thirds of the vote cast for President last fall. Every Congressional district gave a majority against the amendment, with the single exception of the first, which takes in Cape Cod and is chiefly composed of thinly settled fishing and farming villages, where there was a majority in its favor of about 800 out of over 14,000 votes. At the other end of the State, the Eleventh District, which is largely composed of farming towns among the hills, but also has several manufacturing places of considerable size, cast 9,077 votes for the amendment and 10,571 against, this being the next most favorable showing for the Prohibitionists. On the other hand, the city of Boston went almost three to one against the amendment, the vote standing 11,060 for to 31,075 against, and the showing for the Prohibitionists was even worse in Lawrence, where the vote stood 984 to 3,476. Only three cities gave a majority for the proposed change, and one of these is the small city of Waltham; Salem is the one place of considerable size which went that way with a sweep, by the remarkable vote of 2,009 to 879. It will probably appear that a majority of the towns which have a population of less than 2,500, especially in the farming sections, favored the amendment, although in many of these the Prohibitionists were surprised by unexpected defeats.

The effect of the Pennsylvania high-license law in abolishing low groggeries in the cities has been from the outset one of its most marked and gratifying successes. The list of applications granted and refused for Pittsburgh and Allegheny County for the year has just been completed, and the comparative showing with previous lists is very striking. In Pittsburgh only 93 retailers are licensed, as against 214 last year and over 1,500 under the old law. In Allegheny but 39 licenses are granted, as against 78 last year and over 500 under low license. In Pittsburgh eleven wards are left entirely without a licensed house, though most of them are thickly populated and all had a number of applicants. In the county and city but 188 are granted altogether, as against over 500 last year and over 3,000 under low license. Only 64 wholesalers of all kinds were granted license in the entire county. The single fact that there are in a city like Pittsburgh eleven wards almost entirely without a liquor-saloon, is of itself an unanswerable argument in favor of the high-license principle as an effective agency for restricting the liquor traffic. The reduction in the total number of saloons is scarcely less convincing.

The politicians of the late New Jersey Legislature succeeded in defeating ballot-reform legislation in a way which has always been a favorite with their kind. They had a bill, which was a very good measure, passed by a large vote in the Assembly. Then in the Senate they had a very poor measure introduced as a substitute. Neither bill was allowed to become a law, and each party is now charging the other with the responsibility for the failure, while both are secretly chuckling over the way in which they got rid of enacting a law which would have seriously interfered with their business. The chief responsibility for the failure rests upon the Democrats, for they had a majority in both houses, though it was so small in the Senate that it was very easy for the Republicans to block the way of all strictly party measures. New Jersey is not the only State in which the politicians of both parties are hostile to this reform. They would defeat it everywhere if they thought they could safely oppose public sentiment, which is so strongly in its favor.

It is refreshing to read the protest filed by sixteen Republican members of the Minnesota Legislature against the passage of the Granger Meat Bill. They protest against this measure because it is antagonistic to the central idea upon which the Union is based, namely, equality of rights in all the States to the citizens of each and every State. The Meat Bill, they affirm, is a measure of protection to the industry of particular persons in Minnesota, and, therefore, an infringement of the rights of all other persons, an infringement of the right of consumers of meat in Minnesota, and of the sellers of meat in all the other States. "The free and unrestricted interchange of trade between States," they say, "the right of the citizens of one State to sell without let or hindrance the products of their farms or factories in every State of the Union, the absolute destruction of all State lines so far as commerce is concerned, is the strongest link in the chain which binds together the Federal Union. Break this link, and you have taken a long step in the direction of the dismemberment of the Union. In our judgment the effect of this act would be to take a step in that direction. Let this kind of legislation obtain in the several States, and the Republic will have passed the day and hour of its prosperity, and destruction will more certainly threaten than when the clash of resounding arms reverberated in civil conflict." Truer words were never spoken.

The passage of this bill by the Minnesota Legislature really impeaches the capacity of the people for self-government. The bill is, in the beginning, founded upon a falsehood, or a bundle of falsehoods. It assumes that dressed meat coming from other States is unwholesome, the fact being that it is more wholesome than meat eaten immediately after killing (as is usually the case) at home. It assumes that meat can be inspected to better advantage, as regards the public health, before the animal is killed than afterwards, when everybody knows that the contrary is the truth. It assumes that the price of meat to the consumer will not be increased by excluding a portion of the present supply, when everybody knows that if the price were not to be increased by it, the promoters of the bill would never have asked for its passage. It is a translation into inter-State commerce of the principles of the protective tariff, buried under a mass of lies concerning the public health. Perhaps one lie is as good as another to support the doctrine of protection, but neither the protective tariff nor the particular falsehoods which sustain it tend to dismember the Union, as this bill certainly does. Let each State follow the Minnesota example and apply it to all interchanged commodities, and the Union will come to an end, and ought to, because it will not be worth preserving. As the Federal Constitution had its origin in a convention called to promote trade between the States, it would not be an unnatural ending if it should fall to pieces when it ceases to subserve that object.

We are informed, and are satisfied, that we were in error, in our recent article on "Negro Convicts in South Carolina," in supposing that the negro in the first case cited was imprisoned for eleven years on a sentence of one year, whereas, in fact, the pardon was asked for to remove his disability to testify caused by his conviction; he having been duly discharged at the expiration of his sentence. This ground of incompetency of witnesses has been so generally abolished that such a ground for the pardon did not occur to us. We find, however, that conviction in South Carolina for certain common crimes takes away not only the right to testify, but also the right to vote. This may account for the fact that of the white men released from the Penitentiary by the Governor in 1888, all but four received full pardons, while of the negroes so discharged eight only were pardoned and twenty-eight had their sentences

commuted, their disabilities not being in this way removed. It seems that a conviction for petit larceny renders the culprit infamous and deprives him of the rights of a freeman, and for this reason a pardon was asked for "Joe" Anderson in 1886, the trial justice who convicted him certifying to the correctness of the following facts. "Joe" was sentenced to pay a fine of two dollars, or be imprisoned for fifteen days, for stealing two turkeys. He was under fourteen years of age, and had been sent with some other children for the cows; while driving them home, a flock of turkeys got mixed up with the cows and was so scattered that two turkeys were missing. The statement of facts adds that, owing to the tender age of the children, "it is doubtful whether they realized the crime." The Governor granted the pardon, thereby releasing the child from jail, and but for this interposition "Joe" would have been for ever disqualified from testifying in any court in the State and from voting at any election.

The best thing that has happened in journalism for a long while is the increase in price of the New York Sunday papers to five cents. Nearly all of the papers have come into the arrangement, and it would be a good thing if every one would join in the movement. Five cents is not too high a price for the amount of reading-matter presented in one of these issues. Indeed, it would be a good thing if the reform went still further, and the increase in price were accompanied by a decrease in the amount of reading-matter. Nobody wants such a huge pile of stuff dumped upon him in the guise of a newspaper as is now the case on Sunday mornings. "It is as much as a man's life is worth" to try to find any particular needle in one of these great hay-mows, and the mere physical task of overhauling one of these forty-page editions makes the expression "the day of rest" a cruel mockery. We are to have higher-priced Sunday papers; now let us have smaller-sized Sunday papers. The practice of making pack-horses of the innocent and helpless purchasers is a nuisance which ought to be abated.

It is reported that the increase in price of the Sunday editions will soon be followed by an increase in the price of the dailies, and it is earnestly to be hoped that the rumor will prove well-founded. The "two-cent craze" which swept over the field of journalism a few years ago, and led even the *Tribune* to reduce its price from four cents to three, was a curse to the country. It has cheapened the quality of the press far more than its cost, and has lowered the moral tone of the public which reads these depreciated papers. A newspaper such as the New York *Tribune* or the New York *Times* should be, is richly worth four cents, and it ought to bring its value in the market. Both were much better papers in every way when they used to charge what they were worth than they have been since, and both would undoubtedly be much better than they are now if they should go back to their old price. Cheap newspapers have proved a bane to this community, and it would be cause for joy if the public could escape from the evils which they have brought in their train. The percentage of grumblers at an increase of price to a fair rate would be found very small, and any loss from this source would be far more than made up by the gain from the overwhelming majority who would welcome the change.

The rescue of the passengers and crew of the steamer *Danmark* by the *Missouri* in mid-ocean, and the safe landing of every human being on board, is a crown of glory to Capt. Murrill. Of course no sailor will allow any fellow-creature to drown if he can possibly save him; but there are degrees of skill and perseverance in such perilous undertakings, and it appears that Capt. Murrill did just the right thing in each of the several crises that he had to face. He first tried to tow the ill-fated *Danmark* to St. Johns, and, when the storm prevented him from making progress westward, he steered for the Azores. When the *Danmark* was found to be sinking, he threw overboard his deck cargo and conveyed all the passengers on board his own ship in the midst of a tumbling sea. Then a new storm came on, worse, apparently, than the one which had fought him back from St. Johns; but he outrode it and brought all the lives committed to him safely to the welcome land. Capt. Murrill's reward will be found in the lifelong gratitude of those whom he has saved from a watery grave and in the satisfaction of his own noble heart. He will, of course, receive suitable testimonials for his admirable achievement, but something should be done for those who lost all their effects in the sinking steamer.

It will be remembered that in the sharp correspondence which took place in the beginning of the Samoan trouble, between the American naval officer at Apia and the German, the latter answered every protest or remonstrance by referring the American to the German Consul, as his political superior. Prince Bismarck has put a stop to this dependence of naval officers on the Consul. Commanders of men-of-war are instructed not to use force at the direction of the Consul, unless he shows special authority from the Foreign Office, but to examine for themselves the political and military grounds on which the Consul asks for their interference. This is all very well by way of amends to the United States for what has happened in Samoa, but it is fairly open to question whether it is a good permanent division of responsibility. The officer in command of a squadron is usually an Admiral of mature age, and therefore may, as a rule, be safely intrusted with the duty of passing on nice questions of international law; but can the same thing be said of the captains of single ships, who are apt to be much fuller of fight, and to take even a larger view of the rights of their own government than any civilian? We doubt whether the situation at Samoa would have been much improved if the German Captain who wrote those tart, almost insolent, letters to Capt. Leary had been made master of it.

It is impossible to extract from the French newspapers materials for an intelligent opinion about the effect of Boulanger's flight to Belgium on his political fortunes. There seems to be as much diversity of opinion about this as about everything else connected with him. The trial is going on in his absence, and the proofs against him of plotting for a change in the form of the Government, which is an offence under the Penal Code, are said to be strong. The punishment is "deportation" to a penal colony, or imprisonment in a fortress, and he will probably be sentenced to either one or the other. But the Government will probably never try to catch him, and is much obliged to him for keeping out of the way. If he were undergoing his sentence, he would be a martyr, and agitation or intrigues for his liberation would be constantly going on. As he is now, he is a pretender somewhat like Prince Victor, or the Comte de Paris, and as such is an inconvenience, but not as great a one as when he was in Paris, because he cannot be fêted in the presence of the public. The Republicans are evidently completely bewildered as to what should be done about him, and will not recover until the elections in the fall. At the bottom of the trouble is the very unpleasant fact that a majority of the voters in nobody knows how many departments believe in him, and expect some great and beneficent change at his hands. If, therefore, his supporters should get a majority in the next Chamber, or even the balance of power between the Republicans and Royalists, no sentence that may be passed on him now would stand for an hour. He would be master of France.

Probably the last thing that was expected to grow out of the row at Birmingham between the Liberal-Unionists and the Tories was the exchange of "the lie direct" between Lord Randolph Churchill and Mr. Chamberlain. The quarrel is undoubtedly going to make a great sensation out of doors, and may affect coming "bye-elections"; but that it will have any effect on politics in the House of Commons is very unlikely. It is doubtful if any quarrel or dissension would lead the Unionists to desert the Tories in such a way as to cause dissolution and bring Mr. Gladstone in. Whatever bitter things they may say or feel, they will not throw away the labor and sufferings of the last two years and expose themselves to the vengeance of their constituencies. Mr. Chamberlain seems to be a greater enigma than Churchill because he is an abler and astuter man. That he has been wofully disappointed as to the effect of his secession on the Liberal party, is admitted on all hands; that he sacrificed himself to his convictions, hardly any one believes; and how he, as ambitious and restless as he is, is to get himself out of his present scrape, everybody is speculating. Outside Birmingham and the Tory drawing-rooms, he has no standing, but this is a situation which he will never sit down in contentedly. The Birmingham quarrel will not help him out of it.

HENRY G. PEARSON.

THE grave ought not to be allowed to close over Henry G. Pearson, the late Postmaster of New York, without a warm tribute to his memory from those who think the nation needs the services of faithful, upright, and loyal men such as he was. It is not the fault of his friends if any such tribute is more or less tinged with invective. Not only did he die the victim of persecution, but he was persecuted because he did his duty, and no one can honor him now without saying some bitter words of those who are responsible for his failure. He occupied during the last four years of his life a position for which there is, we think, no parallel to be found in any other civilized country—the position of a public servant whose ruin is desired by the managers of both parties, simply on account of his fidelity and efficiency. He literally had no party friends; and the reason he had no party friends was, that he tried to administer his office in the best manner. He was put in his place by President Garfield because he was of all men in the country the fittest to fill it. He was retained in it by President Cleveland partly for the same excellent reason, and partly from a desire to gratify the Mugwumps, who had furnished a sensible portion of the force which won the Democratic victory in 1884. But no sooner was he left in it than he became the object of hatred to all the working politicians on both sides. The Democrats hated him because he was keeping them out of an office which they had for half a century considered and treated as among the *spolia opima* of party warfare. He was hated by the Republicans for allowing himself to be made a standing proof and illustration of the sincerity of Cleveland's reform professions. The *Tribune*, the Republican organ, commented on his reappointment in terms of warm praise on the 1st of April, 1885. It said:

"The reappointment of Postmaster Pearson gives general satisfaction to those citizens who care for efficiency in that branch of the public service here. It satisfies the public, because it is a good thing in itself; because Mr. Pearson is one of many Republican officials who have proved so conspicuously fit that their removal, on whatever ground, and irrespective of the personal merit of any who may be selected in their stead, would be a positive detriment to the public service. Such an appointment is, of course, to be commended most heartily as a good thing in itself. . . . In itself this appointment is admirable. . . . Mr. Pearson's unquestioned and superior fitness renders his retention in office the clear duty of a President who means to improve and not to degrade the public service."

That this was a thoughtless expression, uttered without consultation with the managers, is made probable by the fact that, during the trying years which followed, when Pearson was being literally tortured to death at his post by politicians, it never said another word of encouragement or support. He was literally given up to the party hounds by common consent. He was left to struggle with a force which is now declared, after an examination by Mr. James, the ex-Postmaster-General, 20 per cent. below what it should be, although the Treasury was so full that Congress was playing ducks and drakes with the money. Discontent and mutiny were fomented among his subordinates both by the Knights of Labor and the local politicians. Neither support nor sympathy nor encouragement did he receive from either Postmaster-General Vilas or his successor, Mr. Dickinson. He was not the kind of postmaster they most needed, because he brought out the defects of Jones and Harrity in horrid relief. So he was left to struggle and perish, in full view of the Christian public of this city, without a word of cheer for him or a word of rebuke for his enemies.

We say "Christian public," because there has been a great deal of religion introduced into the last two canvasses for the benefit of this candidate and the confusion of that candidate, but without much profit for the cause of honest government. We want honest government now to profit by it in some degree. When we heard of Gen. Harrison's excellent standing in his church and Sunday-school, and John Wanamaker's excellent standing in his church and Sunday-school, we attached a good deal of importance to the following passage in Gen. Harrison's letter of acceptance:

"In appointments to every grade and department, fitness and not party service should be the essential and discriminating test, and fidelity and efficiency the only sure tenure of office. Only the interest of the public service should suggest removals from office."

We said to ourselves on reading this: "This undoubtedly means either that Pearson will be retained, or that his subordinate next in rank and experience will be, as he was, promoted to the first place. Gen. Harrison is an honest man and good Christian, and undoubtedly wishes us to understand that the New York Post-office will continue to be managed as Pearson managed it, either by Pearson or by another man of the same kind." It appears now that he had no such plan; that when he said this, he was not talking as an honest man to honest men; that he meant to dismiss Pearson all along. He might possibly have found an excuse for dismissing Pearson in the state of Pearson's health, but this reason was never mentioned, because it would have left the public still to expect the promotion of a subordinate. So he was dismissed simply on the hog theory, that "he had had enough," and an expectant politician who knew nothing of post-offices, except as political spoils, was put in his place. Moreover, the *Tribune* was directed, or permitted, by way of excusing this disreputable transaction, to calumniate the outgoing officer in the following really felonious utterance:

"It is a fact that the New York Post-office has declined in efficiency since 1885, and has not for years been in so unsatisfactory a condition as during the year 1888."

Of course it was a cruel and brutal falsehood, and was probably invented as the best apology at hand for Van Cott's appointment. As soon, however, as it became known that Pearson was seriously ill, it was thrown aside, and on the day of his death the following was put out:

"The death of Postmaster Pearson will be received with universal regret. His entire life since boyhood had been passed in the public service, to which he gave himself with an unselfish devotion and concentration that were truly remarkable. There was never any room for question of Mr. Pearson's great zeal and energy and his exceptional mastery of the postal business. His work was a passion, and he seems to have sacrificed everything to it. Such devotion to duty is rare in a public servant, and he deserves the public gratitude. It should be added that his death demonstrates the necessity of making the appointment for which the President has been so savagely assailed. A near relative of Mr. Pearson stated some weeks before his term expired that he could not live three months. Some of the very newspapers which attacked the President with the greatest bitterness, now admit that Mr. Pearson's malady was known to be of a fatal character as long ago as February. A Government cannot permit itself the luxury of sympathy in such a situation. A great bureau like the New York Post-office could not be exposed to the risks this implied. It must be obvious now to all that the reappointment of Mr. Pearson was an impossibility."

It is difficult to characterize this afterthought in the terms it deserves, but it hardly needs characterization. We have gone over the transaction with this minuteness because it constitutes the best illustration we could provide of the value of Mr. Pearson's life, and of the diabolical nature of the system to which he has fallen a victim. His remark on his death-bed, referring to the discontent stirred up among his subordinates, that "he had spent his life fighting the spoils system, and that it grieved him to know that those for whom he had fought had misunderstood him," was literally true. He not only spent his life fighting the spoils system, but the spoils system killed him finally. The service of the Government ought to be full of men of his type. It ought to be the place in which able administrators and loyal and patriotic men could show their devotion, and exhibit to the youth of the country a shining example of business virtues. But it is nothing of the kind. It is a gambling-house, conducted with gambler's morality and for gambler's ends, to the shame and scandal of everybody who believes that a nation has a conscience and ought to use it.

A POSSIBLE SOLUTION OF THE SPOILS PROBLEM.

THE now generally admitted failure of President Harrison, in spite of his promises, and in spite of the solemn pledges of his party, to make any stand against the prostitution of the public service for party purposes, will satisfy a great many people that nothing is to be hoped for in this matter from any President. They will say that after the shortcomings of Grant, Hayes, Garfield, Cleveland, and Harrison, all of whom were pledged to do their utmost to prevent the offices from being treated as "spoils," there is little use in expecting the necessary degree of firmness from any of their successors, at least until the Constitution can be amended so as to forbid reëlection. But although there is a sensible growth of public opinion in favor of such an amendment, its adoption must, under the most favorable circumstances, be a long way off. In the meantime, what is to be done? Is there no way of *early* escape from the quadrennial repetition of the degrading and disheartening spectacle which we are now witnessing, which makes every

intelligent American blush for the religion, morality, and politics of the country?

We venture to suggest a possible solution of the difficulty, in the shape of what we may call the purchase of the offices by the Government from the politicians. Fantastic as it may seem at first sight, it will be found on examination to have few, if any, weak points. It is not a new mode of deliverance from the spoils system, any more than the spoils system itself is new. Every modern State has passed or is passing through a political stage in which the Government offices were claimed as property by some class whose interests were opposed to those of the public. In France, before the Revolution, nearly all offices, including the judicial offices, were the property of individuals, and vendible as such—that is, individuals had a recognized legal or customary right to hold them, without regard to the manner in which the duties attached to them were discharged; but in every case that we can recall, the system was defended on the ground that, however objectionable in theory, it "worked well in practice"; that the incumbents were on the whole competent and well behaved.

The nearest and latest analogy to our own trouble is to be found in the venality of commissions in the English Army which Mr. Gladstone abolished in 1870. For nearly two centuries the right to command in the regular army, from the grade of ensign up to that of colonel, had been bought and sold, not exactly, but very nearly, as merchandise. It had been vigorously denounced for seventy years when Mr. Gladstone attacked it, but was defended on the ground on which our spoils system is defended—that it was English, was long established, and "worked well," witness all the battles the army had won under it over the French, for instance, who had tried to get along without it. This defence was so strong that it was impossible to get through the House of Lords a bill buying the commissions back from the officers at their market value, and Mr. Gladstone had finally to bring prerogative into play, and compel every officer, by "royal warrant," to surrender the right to sell his commission to anybody but the Government. It cost £8,000,000, or $40,000,000, to buy back for the nation the right to officer its own army in its own way, and this not in China or Japan, but in England, and not in the fourteenth century, but twenty years ago.

Our trouble is very similar. Through a custom which in fifty years has come to have the force of law, the right to fill the salaried offices of the Government belongs to the men who manage the nominating and electioneering machinery of the party which wins at the polls, without reference to their fitness for the duties. The system is defended on four grounds: (1) that it is, whether good or bad, now so rooted in our political manners that it cannot be changed; (2) that if it does not provide an ideal civil service, it provides one which is good enough and satisfies the people; (3) that our party organizations could not be kept going without it, inasmuch as parties need managers and workers, and managers would not manage or workers work, if victory brought no substantial rewards in the way of salaries; (4) that politics in every free country needs the attention of a class which can give their whole time to it, and this class our spoils system supplies.

Now, the plan we suggest meets every one of these arguments. It consists simply in the duplication of every salaried office in the civil service, distinguishing the second one as "Political." For instance, we would have a Collector and a Political Collector, a Postmaster and a Political Postmaster, an Appraiser and a Political Appraiser, a Consul to Hong Kong and a Political Consul to Hong Kong. The emoluments of each would be exactly the same, but to the political place no official duties would be attached. The incumbent would have all his time at his disposal for the service of the party. The salary would give him all the reward he now seeks or gets for his work in the Convention or in the canvass. The Political Consul, for instance, instead of having to go abroad, would be able to stay at home. The Political Collector or Appraiser would be able to continue to live in his inland city instead of taking up his abode in a seaport. Though last not least, there would be no objection whatever to the distribution of these political offices through members of Congress or local Bosses. They would, after the election, be handed over to the party managers, without let or hindrance, to do with them whatever the party needed. The President and the heads of departments would be delivered from all "pressure," and the office-seekers from the necessity of going to Washington to beg.

The President and the members of the Cabinet could then distribute the other offices on the ordinary business principles. There would be no more clamor for the removal of competent persons than there is in a banking house or a wholesale grocery. The Treasury and custom-houses and post-offices could be manned by properly equipped men, of whose experience as they grew older the Government would get the benefit. When a new Administration came in, there would be no "guillotine" set up, and few or no vacancies to fill, and no new "policy" to carry out in sorting letters or casting up accounts. Each President would follow the same rules of arithmetic and obey the same laws of morality as his predecessors. The public would enjoy peace and quiet, and the newspapers be delivered from prolonged discussion of the morals and manners of a host of shady adventurers eager to take charge of the national affairs.

But what would this cost? Well, a mere trifle for a country with resources like ours, namely, about $40,000,000 per annum. We can afford this without even feeling it. We should get in return for it not only greatly increased economy and efficiency in the administration of the Government, not only deliverance from what the Republican platform calls "the danger to free institutions which lurks in the power of official patronage," but also deliverance from the very corrupting spectacle which nearly every change of Administration now offers, of religious men descending to the tricks and subterfuges of the card-sharper and confidence man.

COURTS AND CUSTOMS.

It is plain to see in what is going on in the custom-houses and in the Treasury Department that taxation reform has taken on a new phase. A bill reported during the last Congress by Mr. Allison's Committee, and adopted by the Senate, leaves no doubt that protectionists intend that hereafter the Executive shall be free to put any interpretation it pleases on tax laws, and especially on customs laws. It is true that no legislation can take away from importers the right to maintain pending suits and prosecute them to final judgment, but it is in the power of Congress to say that thereafter, in the interpretation of a tax law, the Executive shall not, excepting where suits have been begun, be subject to the judicial power. If the next Republican Congress shall push through such legislation, the protectionists will have their own way so long as they can, as now, control the Executive, and Congress can be kept quiet. The protectionists will say their legislation is intended to prevent scandalous and improper custom-house refunds. They forget or fail to see that such suggestions of scandal and impropriety are an arraignment of the Federal circuit judges and of the Supreme Court, on whose decisions the refunds are made. The real object of the protectionists has been, and is, to prevent interference with their schemes either by jurors or judges

Such legislation as the Senate adopted, on the report from the Allison Committee, could not have been possible had not Republican Senators lost sight of the rules and maxims which we inherited from England for the protection of the citizen against the levy of taxes not imposed either by Parliament, or Congress, or any law-making power. Those salutary rules for the protection of the citizen and his property were vigorously applied when the tariff law of 1833 had made such an overturning of previous legislation. One of the earliest expositions and applications of them was made in 1838, by a magistrate who cannot be classified as a free-trader. In the case of Adams vs. George Bancroft, then Collector of the Port of Boston, which presented a question touching the rate of duty of French silk gloves, Mr. Justice Story told the jury: "Laws imposing duties should never be stretched beyond the natural import of the language. Duties are never imposed upon citizens upon doubtful interpretations, for every duty imposes a burden on the public at large, and is construed strictly, and must be made out in a clear and determinate manner from the language of the statute." The suit of Hoyt vs. Hall, tried in New York in 1840 before Judge Betts, related to the rate of duty on merino shirts, and that excellent magistrate charged the jury in these words: "If, then, these articles might be indifferently placed under either class, and are known in trade as well by the one name as the other, then they are to be subjected to the lesser

duty; because if the description by which the impost is laid is ambiguous, or susceptible of two interpretations equally conformable to its general import, that one is to be adopted which is least burdensome to individuals. It is not to be supposed that Congress designed to impose the higher rate of duty where a different one may apply to the same subject, unless Congress expressed that intent by plain and definite language." Attorney-General Butler reported to President Van Buren that he had no exception to make to that language.

Over twenty years later Mr. Justice Nelson, having to instruct the jury in regard to the rate of duty on Peruvian bark, said: "In case of serious ambiguity in the language of the act, or doubtful classification of articles, the construction is to be in favor of the importer, as duties are never imposed on the citizen upon vague or doubtful interpretations." Ten years afterwards, in 1873, a question under the Internal Revenue Law, concerning the taxation of dividends declared and payable by railroad companies during the last five months of 1870, came before Federal Judge McKenna. He said: "When there are doubts concerning the meaning of a tax law, such doubts must be resolved in favor of the citizen. The exercise of the power of taxation is not to be affirmed upon conjectural or arbitrary inferences. No burden is to be taken as imposed upon the citizen which the Government has not clearly made it his duty to assume, nor can any portion of his property be exacted for any purpose except in pursuing an unambiguous mandate. Whatever degree of liberality, therefore, may be allowable in the construction of statutes relating to the revenue of the Government, there is neither reason nor justice in expanding them, by a strain upon the ordinary import of their words, to give effect to a hypothetical legislative intention." We commend that teaching to the attention of Naval-Officer Burt.

In 1873 the Supreme Court of the United States, having before it a question arising under the Internal-Revenue Law, said: "If there is a doubt as to the liability of an instrument to taxation, the construction is in favor of the exemption, because, in the language of Pollock in Girr vs. Scudds" (an English case), "A tax cannot be imposed without clear and express words for that purpose. These principles are based in good sense, and are sustained by the authorities." In view of a tendency to disregard these salutary rules, the Supreme Court has recently felt called upon to reaffirm them. Its conclusions were announced on May 2, 1887, in this language: "We are of opinion that the decision of the Circuit Court was correct. But, if the question were one of doubt, the doubt would be resolved in favor of the importer, *as duties are never imposed on the citizen upon vague or doubtful interpretations.*"

The significance of that language is in the fact that Secretary Manning, in his report to Congress of December 7, 1885, on "The Collection of Duties," had carefully considered the whole subject. He referred to the utterances of the Federal judges prior to 1885 as "conformable to the spirit of our institutions and to the feelings of the people from whom money is taken by taxes," and added: "In respect to all the decisions, and the principles of the decisions, which have been heretofore made by my predecessors in respect to classification and rates of duties, which decisions are now pending in the courts, I shall in no way interfere excepting to take care, so far as I can, that the defence to be interposed by the several district attorneys shall be thorough and adequate. Those suits have passed out of Executive determination, and are substantially in the hands, so far as the Executive is concerned, of the Department of Justice and of the courts." But he distinctly declared that, in respect to all *new* questions, as they may arise, touching rates of duty, he should, "until otherwise directed by superior authority," require the decisions of the Treasury Department to conform to the rules prescribed by Story and Nelson. That was a sound and beneficent measure of tariff reform, enforced by Secretary Manning so long as he controlled the Treasury Department; but, after his death, not only was the mandate of the courts disregarded in this particular, but its decisions were openly defied, under the pretence of efforts to be made to persuade the court to reverse its own decisions in the interests of protection. In one or two instances, and notably in the case of knit-goods, the efforts were made, and, the Court having refused to stultify itself, the protectionists thereupon set on foot in the Senate a scheme to exclude the courts altogether from interfering with the doings of the Treasury in the interpretation and enforcement of tax laws.

NEGRO CONVICTS IN SOUTH CAROLINA.

We return to this subject on account of one or two protests received from Southern correspondents who think we have misrepresented or misunderstood the attitude of the whites in South Carolina towards negroes accused of crime. For a clearer understanding of the matter, we add a few cases from the Governors' reports of recent years, selecting such as give trustworthy statements in the words of the Governor, or of those actually participating in the trials.

Griffin De Laigle, a negro, who is described as "a stranger without money, friends, or influence," was sentenced to be hanged for murder by Judge Hudson at Beaufort in June, 1887. The homicide for which he was arraigned was committed on board an excursion steamer on the way from Savannah to Beaufort, and he was forced to trial without a single witness, and "with only his unsupported statement as his defence, which, if it had been believed, must have caused the trial to result either in a verdict of manslaughter or of acquittal." After the trial, affidavits were obtained from Savannah disclosing a case of self-defence, and the Governor, on examining them, says: "If the statements contained in these affidavits are true and could have been presented to the jury, the result of the case would probably have been different. It is especially to be remembered," he adds, "that the prisoner was a stranger without friends, and unable to employ counsel, and too poor to pay for the attendance of witnesses." He dwells upon the fact that the State had no method of compelling the attendance of witnesses from Savannah; and, feeling that circumstances warranted action on his part, he commuted the sentence to imprisonment for life at hard labor. We regret that we do not have all the papers in the case, as it seems at least likely that the offence was committed on "the high seas," in which case the United States Court alone had jurisdiction; but as the negro was too poor to employ counsel, it is probable that this point was not raised. Further, the Statutes of South Carolina (sections 835 and 2638) give accused persons the same right to detain and compel the attendance of witnesses that is given to the State; yet here the witnesses against the prisoner were detained, while those in his defence were allowed to return to Savannah. This again shows the disadvantage of being a negro without money, friends, or influence. At any rate, as the Governor states the case, a man probably innocent is imprisoned for life without an opportunity to prove his innocence.

A second case is that of Cæsar White, sentenced to be hanged for murder by the same judge, at the same term of court. The Judge reports that to his surprise the defendant's counsel offered no testimony, not even that of the prisoner. He refused to grant a new trial, and has "no recommendation to make." The Governor, with the Attorney-General, examines the evidence, and reports that, "after a very careful examination of the case, I have come to the conclusion that there is sufficient doubt, from the very nature of the evidence, it being wholly circumstantial and far from conclusive, to make it my duty to commute the sentence to imprisonment for life at hard labor"; and then follows the astounding statement that "there was no eye-witness of the murder, and the chief circumstance against the defendant appears to have been the presence of mule tracks, supposed to have been made by the mule of the defendant, near where the body of the deceased was found. In my view of the testimony, I have felt it to be the only safe course to commute the sentence as above indicated." This case adds a new terror to mules.

In other parts of this Union a Governor in such cases as these two would feel legally bound to issue full pardons; but Gov. Richardson finds imprisonment for life the limit of his clemency, although the fact that he has interfered in behalf of one-ninth of all the convicts in the Penitentiary in a single year shows that he is at least mercifully inclined. The reason for this difference we are left to conjecture, but we are inclined to think that the Governor is acting in deference to a strong public sentiment. We are confirmed in this view by the confident way in which juries appeal to the Governor to assist them in imposing life sentences on negroes. Thus, in the case of John Green, sentenced to be hanged for murder in June, 1888, "The petition is from

the jury that tried the case, and states that they brought in a verdict of guilty, with a recommendation to mercy, . . . in the firm expectation that the Governor would commute the death sentence to imprisonment for life"; and the Judge, strange to say, joins in this remarkable petition. The Governor misses his opportunity to put a stop to this sort of legal travesty, and makes the commutation as requested.

A still more outrageous case occurred in Charleston in February, 1887, where a negro was sentenced to be hanged for murder. The jury assure the Governor that, "We are of the opinion that the evidence, though of considerable weight, was of such a character as to create a doubt in our minds as to the justice of inflicting the death penalty; the verdict 'Guilty, with a recommendation to mercy,' was the result of a compromise, some being in favor of manslaughter and one in favor of acquittal. The recommendation was thought proper, the jurors being of the opinion that it was a certain mode by which the prisoner could escape death, . . . and the witnesses against the accused were of such a character as to force us to believe that the benefit of every reasonable doubt should go in favor of Marcus Horlbeck." The legal enormity of this case can hardly be described. A jury, sworn to try the prisoner according to the law and the evidence, deliberately plots to secure the imprisonment for life of a man of whose guilt they have grave doubts; and Judge Hudson lends himself to this scheme by writing to the Governor, "I really think this is a case in which the recommendation of the jury should be respected and the sentence be commuted to life imprisonment," and the Governor complies. It is an elementary principle of criminal law, which it is inconceivable that the Judge did not impress upon the jury, that unless the jurors are convinced beyond a reasonable doubt of the guilt of the prisoner, a verdict of acquittal must be rendered; and, above all, in a capital case, the prisoner is entitled to the benefit of every reasonable doubt. The plain duty of the Judge, on learning of this extraordinary juggling with human life, was to set the verdict aside and order a new trial.

This inability of Judge and Governor to administer the law in the face of public opinion is further shown in the case of Richard Davis, sentenced to be hanged for murder in 1885. Judge Kershaw writes that "the defendant was under fourteen years old, and seems to have had very little, if any, mental or moral training, and the jury, for these reasons no doubt, recommended him to mercy. I think the recommendation of the jury well founded, and do not hesitate to say that in my judgment the ends of public justice would not be met by the execution of a boy so young and lacking in intelligence that he fails to understand the crime committed"; and he recommends the commutation of the sentence to imprisonment for life. The law, however, goes further than Judge Kershaw, and forbids the imposition of any punishment on a child so lacking in intelligence as not to understand the crime committed; but the Governor agreed with the Judge, and another legally innocent person is imprisoned for life.

These cases show—and they do not stand alone—that South Carolina juries convict negroes where legal proof of guilt is confessedly wanting, and judges and Governor support them in such disregard of all rules of law. They shrink from the consequences of their acts when they are to take life, but they do not shrink from imprisoning innocent men for life. The reason for this our South Carolina friends can help us to give, but the evidence indicates that public sentiment demands that a negro who has the misfortune to be suspected of crime, shall be shut up until the suspicion is forgotten and somebody asks the Governor to let him out.

A WEST-EASTERLY COMMEMORATION AT JOHNS HOPKINS.

BALTIMORE, April 20, 1889.

THE *Nation* for December 20, 1888, in an editorial which spoke of Johns Hopkins University as "one of the most potent of the intellectual forces of this country," used these significant words: "But the service which Johns Hopkins University has done to the advancement of learning in America cannot be measured by the instruction that has been given within its own walls and the researches which have been carried on by its members." That the Johns Hopkins University epitomizes in its policy and attitude towards every forward intellectual or political movement of the day the most virile spirit of the American mind, has been strikingly shown this week by a notable meeting held in Hopkins Hall on the evening of Wednesday, April 17. The invitation to this gathering read as follows:

"JOHNS HOPKINS UNIVERSITY
COMMEMORATION OF THE PROMULGATION OF THE CONSTITUTION OF JAPAN.

"You are respectfully invited to be present at an assembly of members of this University interested in Political Science, which will be held in Hopkins Hall, Wednesday evening, April 17th, 1889, at eight o'clock, to commemorate the promulgation of the written Constitution of the Empire of Japan.

"D. C. GILMAN, President."

The platform was artistically decorated with the flags of Japan and the United States, draped over a large emblazoned shield of the University, with its stirring motto, "The Truth shall make you free!" while in front of this effective background were grouped masses of the pyrus japonica, flowering peach, yellow broom plant, wild cherry, and magnolias—all blossoms with whose decorative value the Japanese have made us familiar. The Chairman of the evening was T. M. Cooley, LL.D., late Chief Justice of Michigan, now an active member of the Inter-State Commerce Commission. On the stage with him were, besides the trustees and leading professors of the University, and the Japanese post-graduate students, the Mayor of Baltimore and members of the Japanese Embassy, who had come from Washington to take part in this first public recognition, by any leading seat of learning, of the importance of the promulgation of a document aptly called the Magna Charta of Japan.

President Gilman stated briefly that the celebration had been suggested by the receipt of a double set of official copies of the Proclamation, the Constitution, laws, etc., one set coming from Mr. Mutsu, the Japanese Minister to the United States, the other from Mr. Mitsukuri, Ph.D., a graduate of the University, now Professor of Chemistry in Tokio, Japan. There was a special appropriateness in holding this commemorative meeting in Baltimore, as the Political Science Department of the Johns Hopkins had taken a deep interest in the events which had led up to this unique grant of constitutional rights—an interest that had been intensified by agreeable personal associations with some very able graduates and students, who had won, or were now winning, honorable distinction in the University "by their talents, their industry, and their fidelity." He then called on a "special student," Mr. Kikujiro Saigo, attaché of the Japanese Legation at Washington, who is a nephew of Count Saigo Tsukumichi, Minister of State for the Navy, and one of the countersigners of the Constitution, to read the names of the Japanese who had been at the University or were now there.

Judge Cooley was then introduced as chairman, and the formal programme began. "When the political institutions of any people are under consideration, the question must be whether they are in accordance with the life of that people. The successful government must be that in which the people have the share for which they are fitted." In this opening sentence of his brief address Judge Cooley gave the keynote of the spirit in which our study of new Japan should be undertaken, and, from his standpoint of a constitutional lawyer, indicated the lines on which alone permanent and healthy political growth can be expected. That this foreign comment was matched by the native point of view expressed in the speech of Mr. Iyénaga shows that much current criticism on the subject of Japanese fickleness and unseemly haste to adopt Western habits and ideas is founded in ignorance, and ignorance not only of Japanese, but of universal political history.

The Japanese Minister was to have read the Emperor's speech at the proclamation, in his own language, but a cold interfered with his doing so, and instead his Secretary of Legation, Mr. A. Sato, Ph.D., read it in English, as follows:

"Whereas, We make it the joy and glory of Our heart to behold the prosperity of Our country and the welfare of Our subjects. We do hereby, in virtue of the supreme power We inherit from our Imperial Ancestors, promulgate the present immutable fundamental law, for the sake of Our present subjects and their descendants. The Imperial Founder of Our House and Our other Imperial Ancestors, by the help and support of the forefathers of Our Subjects, laid the foundations of Our Empire upon a basis which is to last for ever. That this brilliant achievement embellishes the Annals of Our Country, is due to the glorious virtues of Our Sacred Imperial Ancestors, and to the loyalty and bravery of Our Subjects, their love of their Country and their public spirit. Considering that Our subjects are the descendants of the loyal and good subjects of Our Imperial Ancestors, We doubt not but that Our subjects will be guided by Our views, and will sympathize with all Our endeavors, and that, harmoniously coöperating together, they will share with Us Our hope of making manifest the glory of Our Country, both at home and abroad, and of securing for ever the stability of the work bequeathed to Us by Our Imperial Ancestors."

Extracts from the most important sections of the Constitution were given, with running comments by Professor A. B. Small; but as the *Nation* has already reviewed this document, we will pass on to the *pièce de résistance* of the evening, a paper on "The Changes in the Political Life of Japan," by Mr. S. Iyénaga of Tanagawa, Japan, a Ph.B. of Oberlin College, where he led his class in oratory and composition, now a candidate for the degree of Doctor of Philosophy in the Johns Hopkins University. This paper will soon be accessible to all interested in Japanese progress, through a Johns Hopkins University publication. We think that those who read it will feel hopeful of the work to be accomplished by the Diet whose

first session will be held in 1890. Speaking slowly and deliberately, so as to give clear utterance to a language not his own, though handled with a terseness and idiomatic ease that much older native-born students of the University might envy, Mr. Iyénaga rapidly outlined the historic causes which had produced the written Japanese Constitution promulgated in February, 1889, twenty-one years after the revolution of 1868, when the shell of feudalism crumbled into ashes. He pointed out the importance of this action of the Emperor, not only for Japan, but for Asia:

"This is the first birth of Liberty on Asiatic soil. Well may Japan rejoice in being the first-born of Liberty in the East. Well may the Emperor be gratified by the gladdened shouts of his subjects and the blessings of their descendants echoed back from future generations of free and happy subjects. . . . Many ask, 'How can Japan, with a government fixed for centuries, suddenly in a day change absolutism into constitutionalism?' No people can do this. Japan has not done so. Our new Constitution is not the patchwork of a few clever minds infected by Western ideas: *it is the outgrowth of our national life and thought.*"

Mr. Iyénaga went on to explain that it is the result of the efforts of earnest, patriotic men for two generations and more, the result of education, both academic and practical, of experiment and investigation, of adaptation and reorganization; but above all, that it is a proof of the power of the ideal, of the force of ideas in national life and thought. Although it took its first definite form when the royal party, having triumphed at Fushimi, Uyeno, and Hakodate, abolished the Shogunate, that usurping sham of illegal authority, the seeds for its development had been planted by teachers like Fukuzawa. The advent of the American, the Englishman, and the Dutchman had shown thoughtful Japanese that the outside world held lessons for them. They learned those lessons not from fear, nor from policy, nor from greed, but, as all noble natures absorb truth, because they have an affinity for it. The spirit of liberty entered in and took possession of the leaders of the people—leaders, most of them, who had made their way to the front by fidelity, hard study, toil, and patriotism. "Liberty, equality, and fraternity" was their watchword, but it taught them to preserve, to reform, to create, as well as to destroy. A monarchy which had existed for centuries, and had been facile, but never cruel, needed only to be made constitutional, not pronounced criminal. Reason, not anarchy, ruled the counsels of the Emperor Mutzuhito, and the advisers of the young Emperor aimed to educate both people and ruler to let justice and public opinion be their guides.

The new Government, having established itself at Tokio, made friendly treaties with foreign Powers, abolished feudalism, declared all classes equal before the law, so encouraged the growth and freedom of the press that in a few years the circulation of newspapers has increased 40 per cent., applied themselves to the construction of railroads, telegraphs, and docks, organized a postal system modelled on that of the United States, created and equipped universities, colleges, technical schools, and a public-school system for the whole people. "None were debarred from aspiring to places of honor, and in the democracy of letters; a sentiment was growing that the son of a Daimio was not necessarily better than the son of a peasant. The day of reason and peace had dawned."

In 1878, as a work of preparation for a national assembly, local assemblies were formed, and it is probable that the Imperial Parliament which meets next year will be composed largely of men trained to public affairs in these provincial bodies.

"That Japan of to-day should be ruled by the absolute power of one man is just as impossible as that England of to-day should be ruled by Stuart despotism. A great work lies before Japan, a work important not only to her, but to Asia, amid whose teeming populations she is the vanguard of all that is best in modern civilization. Our prayer is, that Japan may prove herself worthy to be the leader of Oriental nations in a new era, and our faith is equal to our hope. I am proud of having been born a citizen of Japan, and to be a student of Johns Hopkins University, whose fame, encircling the earth, has reached the land of the rising sun."

Prof. Adams read portions of a letter from Dr. Woodrow Wilson, author of 'Congressional Government,' explaining that while the constitutional ideas common to all political growth of this century had entered into Japan's new constitutional law, her statesmen had drawn details more largely from the German Constitution than from that of any other people, Germany's organic law being more acceptable to the citizens of a monarchy where the divine ancestry of the Mikado is still an article of faith, or at least of sentiment, with the mass of the people. Letters were also read or reported from Rear-Admiral Balch, U. S. N., who accompanied the Perry Expedition to Japan; from Chief-Justice Fuller, Dr. David Murray of Albany, N. Y., formerly Superintendent of Educational Affairs in Japan; from President Angell, lately United States Minister to China; Hon. Carl Schurz, Cardinal Gibbons, Dr. William Elliot Griffis, author of the 'Mikado's Empire,' etc.; from Hon. John W. Andrews, LL.D., of Ohio, President Gates of Rutgers College, and others. An extract from Dr. Griffis's letter gives a bit of chronology:

"It is interesting to Americans to know that the imperial oath was taken and the Constitution promulgated to a day, and almost to the exact hour, thirty-five years after the treaty ships of Commodore Perry were sighted by the watchers on the hills of Iozu; and that the Emperor Mutzuhito, the 123d Mikado, who granted this Magna Charta of Japanese liberty, was born November 3, 1852, on the day that Matthew Calbraith Perry was all ready to sail to Japan, though the delay of one of his vessels kept him on our coast until the baby in Kioto was three weeks old."

If not claiming too much space, I should like to close this record of a very delightful gathering with some portions of a letter, too long to be read at the meeting itself, from Mr. Charles Lanman, on the services of Viscount Arinori Mori, to whom Mr. Lanman was at one time secretary. Mori was a typical Japanese of the new intellectual era, for the lesson in political science so graciously presented by Johns Hopkins University will lose its chief force if we fail to see that the political changes in Japan are the mere outward and visible sign of a national intellectual and moral development, largely due to the noble, earnest, and patriotic teachings of such propagandists as Mabuchi, Hirata, Saigo, Katsu, and Mori. Verily, a remnant shall save a people:

"Arinori Mori was born in the province of Satsuma in 1846, and as a boy enjoyed all the advantages pertaining to the retainers of the local Daimios. He was one of the first of those students sent abroad to be educated, and he spent two years in England. During the rebellion in Japan which culminated in the restoration of the Mikado to power, his sympathies were with the progressive party, and it was not long before he became a member of the newly organized national legislature, so called, and in which, notwithstanding his age, he made a decided impression. . . .

"Mori was also the first Japanese who, under the restoration, was appointed to a foreign mission, and in March, 1871, while bearing the title of Jugoi, he presented his credentials at Washington as Chargé d'Affaires, where he remained two years. . . . Not only did he perform his diplomatic duties, but he was obliged to exercise a kind of supervision over the large number of Japanese students then in this country, and especially over five young ladies who came over here to be educated. In one sense, moreover, he had charge of all the arrangements and ceremonies connected with the advent and the sojourn in this country of the Iwakura Embassy. . . . In the meantime, but more in a private capacity than as a Minister, Mr. Mori greatly interested himself in the cause of education, and caused the publication, for the benefit of his countrymen, of a work on 'The Resources of America' (prepared by the present writer), and another by himself on 'Education in Japan.' . . . He also published, among others, a pamphlet on 'Religious Freedom in Japan.'

"One of the incidents illustrating his positive methods as a public man was to this effect: When Yoshida Kiyonari (his successor in Washington) came to this country to negotiate a loan connected with the Satsuma rebellion, Mr. Mori opposed the whole scheme, and not only blocked the financial arrangements, but wrote and forwarded to the Government his reasons in a despatch, wherein he condemned the policy of a loan for such a purpose, and he was triumphant. . . . For a brief period after reaching home he took no part in public affairs. . . . In 1874 he entered the Office of Foreign Affairs as first secretary. His next position was that of second assistant minister. He afterwards went to China as Minister Plenipotentiary, on his return home was made the first Assistant Minister of Foreign Affairs, and in 1879 was accredited Minister Plenipotentiary to Great Britain; for several years before his death he held the congenial position of Minister of Education.

"Prominent as was Viscount Mori's career as an Oriental scholar and statesman, the story of his assassination will pass into history without a parallel. On the morning of February 11, 1889, when he was dressing himself to wait upon the Emperor and take part in the great celebration attending the promulgation of the new Constitution of the Empire, an unknown man called upon him and asked for an interview, . . . stating that a plot had been designed to take the life of the Viscount, and that he wished to communicate the particulars. The request was refused, however, but . . . while walking to his carriage the assassin made an attack on the Minister by stabbing him with a common table-knife. . . . The Viscount only survived a few hours. It was the high character and advanced teachings of this man Mori which tended to make possible the new Constitution, and, with that idea and his career in view, it would seem as if he had died the death of a martyr. On the body of the murderer was found a paper revealing the fact that the murder was intended to punish the Minister for an alleged sacrilege he had once committed at the shrine of Isé, when he refused to remove his shoes, according to custom, and took the liberty of pushing aside a certain sacred curtain. This conduct greatly enraged the attending priest within the shrine, and it was his son, as reported, who committed the murder, by way of protecting the rights of the gods and the imperial family according to the Shinto religion, and to avoid the calamity of losing the protection of the guardian spirits of the nation upon the change to a new form of government. The tragedy was universally regretted, and threw a gloom over the pending celebration which can never be forgotten."

At the end of the exercises in Hopkins Hall, the audience were invited to the library of the University, to take a cup of genuine Japanese tea, steeped by Mr. Sato, the Secretary of Legation.

C. B.

THE LATEST EXCAVATIONS IN GREECE.

CHALCIS, March 22, 1889.

I HAVE this morning left Anthedon, where the American School of Classical Studies at Athens has been carrying on excavations under the superintendence of Mr. J. C. Rolfe, a graduate of Harvard, '81, and a son of the well-known Shaksperian scholar. The work is drawing to a close, and readers of the *Nation* may be interested in a brief account of the results of the excavations.

"There is a certain Anthedon, by the sea-

shore, opposite Eubœa, near the streams of the Euripus; thence am I by birth," says the fisher-deity Glaucus, in an author quoted by Athenæus. Pausanias states that in the middle of the city was a sanctuary of the Cabeiri, with a grove about it, and, close by, a temple of Demeter and Persephone with marble statues. He also speaks of a sanctuary and statue of Dionysos before the city on the side towards the mainland. By the sea was the so-called Glaucus's Leap, which was probably a natural cliff like the numerous Lovers' Leaps on our Eastern coast. In the description of Greece vulgarly attributed to Dicæarchus, there is mention of an agora at Anthedon enclosed by a double stoa and planted with trees.

In the early part of this century, that most clear-sighted of travellers, Col. Leake, identified the ruins of Anthedon and gave a rough diagram in his 'Travels in Northern Greece.' He was able to make out the line of the city and acropolis walls, and speaks of two moles running out into the sea and forming a small port east of the acropolis. He also mentions a platform of a public building, thirty-four yards long, founded in the sea. He refers to this same building again as "probably a temple." Since Leake's time, the ruins have been visited and described by several scientific travellers, but with no additional results. On March 5 work was begun by the American School with workmen from Thebes and from Lukisi, the village nearest to the ruins, thought by some to be on the site of the Homeric Nisa. Through the kindness of Mr. Reed, director of the English company which is engaged in draining Lake Copais, the excavators had the use of one of the company's buildings situated close to the outlet of the tunnel, about a half hour's walk from the ruins. The workmen from Thebes spent the night out in the open air. The top of the acropolis is a ledge of rock, so that there was no possibility of excavating there; but a long ditch was dug through a wheat field, from the acropolis slope inland towards the enclosing walls.

Discovery of the Cabeiri sanctuary would lose some of its lustre, owing to the fact of the Germans having unearthed a temple of the Cabeiri near Thebes last year; but it would be no mean find, and might do something to complete the picture of this mysterious form of worship. Moreover, the discovery of the temple of Demeter would be a necessary consequence of the finding of the Cabeiri sanctuary. But the "middle of the city" is a rather indefinite expression, even when referring to a small fishing-town, and when the eager eyes of the excavators found in the long ditch no small bronze bulls, like those from the temple near Thebes, it seemed necessary to relinquish hopes of the Cabeiri. For this whole district is planted with grain, and every ditch dug involved a certain amount of damages—not of alarming magnitude, to be sure, but hardly to be justifiably incurred when there were absolutely no traces to show where an experiment could be most wisely made.

More success was obtained at two elevations just outside the city walls, where the excavators made use of information acquired by previous (secret) diggings of the peasants, who have been for years in search of graves, and have practically exhausted this industry. Long lines of opened graves on both the Thebes and Chalcis roads testify to their activity in this direction. In one of the hillocks was found the substructure of a small building, and also two Doric capitals of poros stone. Mr. Rolfe thinks this may have been the Temple of Dionysos, and certainly its position agrees perfectly with the language of Pausanias. The other hill was cut up by numerous cross ditches, one of which ran into a most interesting collection of bronze implements, many of them similar to those which were found last year on the acropolis of Athens at a great depth, near the southern wall. There are several two-edged axes, a chisel, a drill, an awl, a sickle-like razor, and a large variety of knives. There is also a fragment of a bronze band with animals represented in relief.

Beyond the walls, on the side towards Chalcis, another trial was provoked by the appearance in a tomb of a large poros block belonging to a Doric entablature, and showing several sets of triglyphs. Another architectural fragment of the same material was close by, and, more important still, a rough block which was shown by the inscription upon it to have been a boundary stone of some sacred enclosure. This had been thrown out from a neighboring grave, to which it had been removed from its original position. The work here resulted in the discovery of several additional fragments of Doric architecture, one piece of which still showed traces of color; of fragments of vases, terracotta figurines, alabaster jars from the graves, as well as an interesting collection of ornaments of gilded pottery; lastly, several inscriptions, two of which, written in the Bœotian dialect, record dedications to Artemis Eilithyia, the goddess of child-birth. Pausanias mentions no temple of Artemis Eilithyia at Anthedon, but these inscriptions, together with the architectural fragments, seem to show that such a temple did exist here. The actual site, however, was not discovered, although the ground in the immediate vicinity was well investigated.

But the greater part of the labor was devoted to Leake's "public building," which has developed into an enormous and anomalous structure, or combination of structures. So large is it that a Government overseer, who arrived a few days ago, when asked what it was, suggested in all seriousness that it was the city itself. There can be no doubt, I think, that the platform seen by Leake as well as the external walls unearthed during the excavations belong to a good Greek period, but some of the interior walls are evidently of later and inferior workmanship, and in the southern portion quite an extensive mosaic flooring has made its appearance within the last week. One or two Doric capitals of poros stone and of small dimensions have been found here, but not a fragment of a statue or relief, and only one inscription, a recruiting-list of the third or second century B. C., showing that Anthedon was a member of the Bœotian League—a fact known, however, from other sources.

In the collections of Bœotian inscriptions heretofore published, Anthedon has been represented by one solitary inscription, and that composed of one word. This number will now be raised to over sixty inscriptions, ranging from the fifth century B. C. to the second century A. D. Some of these were unearthed by the excavations, others collected from the houses of the peasants in Lukisi, who had brought them from the graves which they had opened, and a few were found by Mr. Rolfe and myself in wandering about the graves. It is true that most of these inscriptions are short epitaphs and of little historical interest, but, for the study of a dialect like the Bœotian, in which strong local peculiarities are not infrequent, it is of great importance that every town should be represented, and not until now has it been possible to claim any adequate representation for Anthedon. For example, in the two dedications to Artemis, which otherwise show all the peculiarities of Bœotian spelling, the name of the goddess appears in the Ionic or Attic form instead of the regular Bœotian Artamis, which is the only form to be found in other inscriptions of this dialect.

On the whole, we may consider the excavations at Anthedon as successful, and it is hoped that Thisbe, where work will begin next week, will be even more fertile. The yield of inscriptions promises to be unusually large. At Platæa excavations must be conducted on a large scale, if at all, and it may not be possible to undertake any work there this season.

Since the date of my letter of December last there have been no extensive excavations in Athens. Having completed the work upon the Acropolis, the Greek Archæological Society has undertaken no new enterprise, presumably on account of the unsettled condition of its financial affairs. For years it has derived its funds from the proceeds of a lottery which was under its control, and recently this lottery has been sold to a Vienna bank in such a way that the Society is assured of a large yearly income. At present there seems to be a difficulty, owing to some opposition on the part of the Austrian Government. A few days ago Mr. Tricoupis made a speech in the Boulé, in which he expressed confidence that the matter would be settled in a satisfactory manner. It is more than probable that the Greek Society will eventually take Delphi in hand and carry on the extensive excavations which are so urgently demanded. The German Institute has been digging a few trenches in the auditorium of the theatre of Dionysos for the purpose of finding traces of a structure preceding the time of Lycurgus. They found nothing of importance except a perpendicular shaft of enormous depth, which Dr. Dörpfeld thinks may have had some connection with an aqueduct. Mr. Gardner, Director of the English School, has returned from Cyprus, after having seen the work there begun, but no news of any results has yet reached us. The French School has not yet resumed operations at Thespiæ.

C. D. B.

THE GRAND CONDÉ.

PARIS, April 4, 1889.

JUST at the moment when the unmerited exile of the Duc d'Aumale is revoked, appears the fifth volume of his 'History of the Princes of Condé.' This volume has as much interest as the preceding ones, and it may be said that the literary qualities of the historian are as great, though his manner has suffered some alteration. It is impossible that it should not be so; our minds are always in a state of development, and the lessons of life are not lost on the historian. What will strike the reader in this new volume, which appears so late after volumes iii and iv, is the fondness of the author for the drawing of historical portraits; the influence of Saint-Simon, of the Cardinal de Retz, of Tallemant des Réaux is visible in these fine, picturesque, and original delineations of the many personages who live and move in the atmosphere of the Great Condé. For our hero is already the "Grand Condé": he has already won the battle of Rocroy, saved the French monarchy, and curbed the power of Spain. At an age when most men are only learning, he has given lessons in strategy and tactics; he has all the prestige of a conqueror.

The volume opens at Chantilly: Condé is still called M. le Duc, as his father, M. le Prince, is yet alive. The Duc d'Aumale makes us acquainted with all the companions of M. le Duc; he gives us very striking portraits of Marthe de Vigean, with whom the young hero was for a time in love, who was in love with

him, and, as she could not marry him, would marry nobody, and entered a convent; of Mme. de Montbazon, of Mme. de Chevreuse, of the two Princesses of Gonzaga, who became one the Queen of Poland, the other the Princess Palatine. We become acquainted also with the Duc de Beaufort, with the gentlemen who were called the "Importants," with La Rochefoucauld, with Maurice de Coligny, with the Duc de Guise, with the "libertines"—Bussy, Saint-Évremond, Rivière, Bourdelot, and might we not count also among them Ninon de Lenclos?

Marie de Gonzaga has seduced the historian as she made the conquest of Condé; she had "a valiant nature," a great intelligence. Condé, who helped to place her on the throne of Poland, always remained her friend:

"The Princesses of Gonzaga," says the Duc d'Aumale, "surpass the crowd of the women of the Fronde, even the most celebrated. They do not make a business of conspiracy, like Mme. de Chevreuse, or of *galanterie*, like Mme. de Montbazon; they have as much strength as, and more foresight than, Mme. de Longueville [the sister of Condé], less avidity than the Duchess of Châtillon. Their aptitude goes as far as the government of a party, even of a state. Both, by the audacity of their minds, the loftiness of their courage, the pliancy of their genius, have many resemblances to Louis de Bourbon. They take a great place in his history, at the agitated moments of his life, as well as in the calm and regular years of the end."

Among the friends and associates of the first hour, the "libertines," is Roger de Rabutin, cousin of Mme. de Sévigné—"a petty vassal, . . . not such a grand seigneur as his vanity would have us believe; a very good officer, of the stuff of which marshals of France are made; a valiant soldier, even audacious when he is in sight, but knowing how to spare himself; personally as perverse as his look, which is disquieting and repulsive, yet with much charm. Mme. de Sévigné grants him the pardon which Louis XIV. refuses him." This extract gives a good idea of the terse, concise style of the portraits drawn by the Duc d'Aumale, many of which must have been written after he had left his fine collection of portraits and engravings of the seventeenth century (which was lately and is now at Brussels, pending its return to Chantilly). The Duc d'Enghien brought to his life of pleasure the same ardor as in war. His father, M. le Prince, did not much like his libertine friends and their life of debauchery. The Duc d'Enghien had been married against his wish; family life did not exist for him; Mazarin, who understood him, did not leave him long idle, and sent him to Flanders.

Some people will find the Duc d'Aumale somewhat severe on Mazarin. The French Prince is not even indulgent towards the foreign Cardinal:

"The man," he says, "who so fortunately conducted our foreign affairs, who achieved what his predecessors had prepared, is wanting in that passion for France which inspired Henri IV., Richelieu; he has not the patriotic afflatus which warms the coldness of Louis XIII., which animates the solemnity of Louis XIV. Mazarin is an artist; his origin allows us to say that he governs as a *dilettante*, without any warmth, with a consummate ability; he executes, he develops the plan which others have bequeathed him. His mind is all the more free, his progress is safer—he has not the enthusiasm of success; but the personal calculation, the egoism, the *moi* are too important. One sees it in the affairs of Italy; if the Minister anywhere passes the limits of prudence, it will be on this side. His heart is there as well as his interests; there will money accumulate, palaces will be built, works of art will be collected. In France Mazarin has no family, no hatreds, no friendships; he employs men, lifts them up, puts them down or away, calls them back, according to circumstances. In Italy he has relations, true friends, and even more true enemies."

It suited Mazarin to send Condé to Flanders in 1646, and to make him serve under the orders of Gaston, Duke of Orleans, the brother of the King. After a good description of the Low Countries, the Duc d'Aumale describes the Spanish army under Piccolomini and the Duke of Lorraine. War, as understood in those times, was often a succession of sieges. Condé besieged Mardick, took it, gained a battle at Hondschoote, pierced the Spanish lines, took Furnes, and ended his campaign brilliantly by taking Dunkirk, after a long and difficult siege.

In 1647 Condé was sent to Catalonia. In the splendid gallery of Chantilly, where all the "actions" of the Grand Condé were represented in painting, there is a view of Lerida, with this note: "The only place where the Duc d'Enghien could not make the arms of his Majesty triumph." The siege of Lerida is narrated in the most minute details by the Duc d'Aumale. The historian is familiar with the Commentaries of Cæsar, for Cæsar also made war in Catalonia; he has read the 'Pharsalia,' and reminds us of the fine passage in which Lucan describes the meeting of the Legions which had vanquished Vercingetorix and those which had withstood Sertorius: "The place is the same, the names are hardly changed. The donjon, the cathedral, the thick walls of which seem to defy artillery, crown the rocks where was once Ilerda, and where are now the narrow streets of Lerida." The fate of the campaign of 1647 was decided before that rocky hill, as the fate of the campaign of Cæsar had been in 49. All the efforts of Condé were of no avail; Lerida had a good garrison, a very determined commander. Condé raised the siege on the 18th of June, and, with his little army diminished by sickness, desertion, and constant fighting, he took a strong position where the Spaniards dared not attack him. People would hardly believe in Paris that for once he had been unsuccessful; and the Parisians wrote many songs which were called *Lerida*. Condé was afterwards often heard to sing one of them, which ended thus:

. . . . "Son dada
Demeura court à Lerida."

To this day the name of Lerida is associated with the name of Condé as much as the name of Rocroy.

During the first days of 1648, Condé was called to Burgundy for the opening of the States of that province; in the spring, he left for Arras; he was again to direct the operations in the north of France. We will not attempt to follow the Duc d'Aumale in all the details and complications of these operations. It is enough to say that they ended in the great victory of Lens. Condé made five thousand prisoners; the Spanish army lost three thousand men and more than a hundred flags.

"A glorious battle," says the Duc d'Aumale, "given with the back turned to the frontier, the road to the capital barred, and the capital in a ferment of insurrection; an audacious battle, and nevertheless none was ever prepared with more patience, calculation, and reflection. Let us consider a moment what would have been the consequences of a campaign less wisely conducted for two months, less rapidly terminated in nine days. It would have been the rupture of the negotiations at Münster, a separate treaty between the Swedes and the Emperor, France continuing the war without any allies, Alsace and Artois lost, the gates of Paris in rebellion opened to the Spaniard as they had been once to the English."

Condé was modest in his despatches: the day after Lens, in a letter to Mazarin, he struck out the words "our victory" to write instead "our struggle." But he was modest only in his despatches; he knew and felt himself, he knew that he had saved the country, the monarchy, the minister, and he made Mazarin feel it. It is certainly one of the most extraordinary facts of history that at the very moment when Mazarin obtained at Münster the most signal advantages for France, his power was attacked in Paris with the greatest violence. Condé stood by him and by the King. We cannot give in detail the history of the flight of the King to St. Germain, of the blockade of Paris. Mazarin and Condé together brought the capital to terms, and the "peace of Rueil" was signed. Condé brought the King back to Paris, but the service which he had rendered to Mazarin was so great, and Condé made him feel so much the weight of his protection, that Mazarin soon looked upon him as a danger to the state. He was afraid of a coalition between him and Cardinal de Retz, his most dangerous adversary and a constant conspirator; he feared lest sooner or later Condé should be drawn to the party of the princes and ladies of the Fronde who were opposed to his authority. On the 18th of January, 1650, Condé went to the Chamber of the Council; Mazarin left the room, and soon entered the Captain of the Guards. "What do you want?" "I have an order to arrest you with the Prince de Conti and M. de Longueville [they were also in the Council Chamber]." No resistance was possible. Condé thought a moment of the assassination of the Duc de Guise at Blois. "You are a gentleman; what does this mean?" "Upon my honor, sir, it is a question only of Vincennes."

Condé was taken, with a military escort, to Vincennes. He said afterwards, referring to his captivity: "I entered Vincennes the most innocent of men; I left it the most guilty of subjects." The next volume, now in preparation, will give us the history of Condé's rebellion.

Correspondence.

RAILROAD MORTGAGES AND PRIOR LIENS.

To the Editor of The Nation:

Sir: The editorial on "Railroad Mortgages and Prior Liens" in your last number requires a correction and a criticism.

It was proved, in the case you name, that the supplies in question were required for and used in the operation and maintenance of the C., W. & B. railway. The terms of the statute you quote are broad enough, though, to cover supplies in the wider sense to which you refer.

I fully agree with you that the issuing of railway receivers' certificates has been carried to an excess unwarranted by principle and dangerous in practice. In so far as they are permitted for anything beyond what is actually needed to keep the road in operation, they constitute the abuse of a judicial power whose use was meant to be, and until lately was, for preservation only. Courts can exercise only remedial justice. Improving or changing or adding to a railway is not the application of a remedy, but the exercise of rights of ownership, and therefore unjustifiable interference with vested rights. The note of warning has been sounded more than once; and I believe the courts are about to check this abuse before it becomes a practice so settled that mortgagees may be held to have contracted in anticipation of it. But the decision on which you comment-

ed bears no relation whatever to those involving receivers' certificates or claims for supplies either ordinary or extraordinary, and your suggestion of unconstitutionality of the statute on which it was based was, I am sure, due to misapprehension of its nature and its relation to the contending liens.

The way in which railroad companies may reorganize is specially provided by a subdivision of the statutes of Ohio, of which the section you quote is a part—reorganization having its technical meaning in Ohio and not including the mere creation of a new corporation to buy the property and franchises of a former one. It can only be done on the written assent of the holders of all existing liens. If this is not given, the ordinary remedies are open to all.

The terms on which a corporation may reorganize are certainly as much within the discretion of the Legislature as those on which it may originally organize. One of those terms is made the priority of the liens of judgments for supplies furnished after the reorganization. Every lienholder necessarily assents to this by signing the reorganization agreement for which the statutes provide, and availing himself of the remedy thereby given. The postponement to such subsequent judgment liens of the new security he takes from the reorganized company is, therefore, unlike its postponement to ordinary supply claims, or to receivers' certificates issued for other than purely preservative purposes, based solely on his own consent. Having taken the benefits conferred by the statute, he cannot escape its burdens.

By the decisions of our courts, following the general rule elsewhere, the provisions of the statutes under which railway mortgages are issued become a part of their terms and conditions by operation of law as fully as though expressly stated therein. Full protection against collusion or mistake is, of course, afforded by the courts in the action to foreclose, wherein all liens are open to full investigation.

Respectfully yours, JUDSON HARMON.

CINCINNATI, April 15, 1889.

JURISDICTION WITHIN THREE MILES OF THE COAST.

TO THE EDITOR OF THE NATION:

SIR: In Number 1240, "R. C. M." joins issue on your statement as to the authority of the United States Government to "give law to the subjects of other nations" within "a marine league from our shores." The affirmative of the proposition, as here stated, is not maintained by the *Nation*. Inferentially, however, it is; and "R. C. M." "ventures to call your attention to a decision which puts an end to that pretension." The celebrated case of The Queen vs. Keyn, 2 Exchequer Division, is cited, and extracts from Lord Cockburn's judgment are quoted in support.

The question in the case was one of *criminal* jurisdiction, and that alone. The quotation, "*ex concessis*, the jurisdiction over foreigners in foreign ships, etc.," is limited to this sense, as a reading of the paragraph in which it occurs shows. On the contrary, it was conceded by even the judges forming the majority of the court that, for some purposes, "the concensus of civilized independent states has recognized a maritime extension of frontier to the distance of three miles from low-water mark" (Sir R. Phillimore, p. 81). "The foreigner invading the rights of the local fisherman would have been amenable, consistently with international law, to local legislation prohibiting such infringement, without any stipulation to that effect by treaty" (Cockburn, C. J., p. 205).

But while Lord Cockburn denied to the English criminal courts, by virtue of any common law or then existing statutory authority, or by binding rule of international law, the right to try the German prisoner for his offence committed within the three-mile limit, he intimates (p. 208) that, had Parliament so enacted, there could be no question. In other words, Lord Cockburn's difficulty was one of constitutional rather than international law. Acting on this suggestion, doubtless, the Territorial Waters Jurisdiction Act, 41 and 42 Vict., c. 73, was passed, giving British courts cognizance over all offences committed on "any part of the open sea within one marine league of the coast, measured from low-water mark," of her Majesty's dominions.

Is it too much to premise, then, that your correspondent's logic is somewhat at fault when the conclusion reached is that the judgment in The Queen vs. Keyn "puts an end to the pretension" referred to? Surely, if it is within the competence of the British Parliament to enact the Territorial Waters Act, it is likewise within the authority of the United States Government to give law to the subjects of other nations within a marine league from its shores. R.

HALIFAX, N. S., April 13, 1889.

THE LIMITATIONS OF STATE LEGISLATION.

TO THE EDITOR OF THE NATION:

SIR: Your correspondents, in Nos. 1238 and 1241 of the *Nation*, in criticising Prof. Bryce's remarks upon the powers of our State Legislatures being as great as the powers of the Parliament of Great Britain, except to the extent that our legislatures are controlled by the written constitutions of the United States and the State, seem to have lost sight of the fact that Great Britain has a Constitution, though it be unwritten. Is the Parliament of Great Britain omnipotent? Is it not controlled by the Magna Charta, Petition of Right, and the immemorial customs and usages of Great Britain? And if this be so, are not Prof. Bryce's statements correct, when properly understood, that our legislatures are as omnipotent as the Parliament of Great Britain, except in so far as their powers may be limited by written constitutions and immemorial customs and usages?

Yours respectfully, TALBOT J. ALBERT.

BALTIMORE, April 16, 1889.

TO THE EDITOR OF THE NATION:

SIR: I am surprised that two of your correspondents have seriously questioned the doctrine stated by Mr. Bryce, viz., that the State Legislatures of each State have the same omnipotence as the British Parliament, except as restrained by written constitutions. That doctrine is sustained by an overwhelming weight of judicial decisions. It is thus stated by Judge Cooley in the fourth edition of his work on 'Constitutional Limitations,' page 204: "The rule of law upon this subject appears to be, that except where the constitution has imposed limits upon the legislative power, it must be considered as practically absolute." A great many cases are cited to sustain this view, and none to the contrary. I do not think any case can be found which is expressly decided on the ground that a statute is void because in conflict with any custom or any principle of justice not found in the written Constitution, though undoubtedly there are dicta to this effect, some of which are cited by one of your correspondents.

And the doctrine stated by Mr. Bryce is as clear on principle as on authority. What is the basis of the American doctrine, unknown elsewhere, of the right of the judiciary to declare legislative acts void? Only this: the court looks from the statute to the higher law of the Constitution, and, perceiving a conflict, decides in favor of the law, which is supreme. The powers of our judiciary are based on written law. In what States are they authorized to say that a statute, not in conflict with the written Constitution, is void? The province of a court is not to make law, but to interpret the law made by the law-making department. No doubt, where they find no rule of law established sufficient for the decision of a case, they have to make a rule. But where they find a rule made by the proper department, how can they justify its overturn, except by pointing to a law higher than the statute made by the people, the supreme law-making power?

The doctrine that there are restrictions upon the Legislature which it is the duty of the courts to enforce, not found in our written constitutions, leads to the greatest uncertainty in constitutional law. It gives weak judges a plausible excuse for holding void any statute they do not like. And though I think no court has ever undertaken to justify the holding void a statute not in conflict with the written Constitution, statutes have been in many cases set aside, where the court did not point out the constitutional provision with which the statute was in conflict. Michigan has had its full share of this class of decisions, and the natural result was pointed out by Judge Cooley in an opinion given in the State Tax cases decided in 1885 (54 Mich., 446). He says: "It seems to me that on constitutional questions the Court is drifting to this position, that those statutes are constitutional which suit us, and those are void which do not." Whether Judge Cooley's utterances upon the power of the courts to set aside statutes have always been consistent I will not say; but certainly the latest expressions of his opinion are in favor of the rule stated by Mr. Bryce. C. A. KENT.

DETROIT, MICH., April 13, 1889.

TO THE EDITOR OF THE NATION:

SIR: You have lately published two letters, one from I. H. Lionberger and one from "E. W. H.," both to the effect that American courts do hold, and of right ought to hold, acts of legislatures unconstitutional and void, even though they do not contravene any express provision of the State or national Constitution, provided they are contrary to what the court may regard as the general principles of free government. In the words of "E. W. H.," "Our courts . . . will enforce not only the guarantees of written charters, but also the unwritten principles of constitutional government."

I doubt if there are many lawyers that will assent to this most dangerous and revolutionary doctrine; but, for the sake of those of your readers who are not lawyers, I do not think the statements of your correspondents ought to pass without a protest. Certainly if the doctrine which they enounce were generally maintained by the courts, our government would already have become one of men and not of laws. That the men by whose permission we should hold all our dearest rights are judges of the courts and generally men of high character, does not affect the principle. If a contract made or an act done by me in accordance with the law of the land as declared by the Legislature, can be annulled and held void by a judge, not because it contravenes any provision of the Constitution, but because that judge believes, or claims to believe, that it is not in accordance with the principles of abstract justice, then I have no rights except such as that judge chooses to allow me. The power of a court

to nullify an act of the Legislature is a most dangerous power, reaching backwards as well as forwards, and should never be exercised except in accordance with some express provision of the written Constitution.

There are a few cases in the books, both in England and America, where a judge has assumed to hold a statute void as opposed to natural right, but neither in England nor in America have courts any such dispensing power. There have been many questionable decisions annulling statutes, but most of them have been under the clause of Magna Charta, repeated in substance in all our constitutions, to the effect that no one shall be deprived of life, liberty, or property without due process of law. What amounts to a deprivation of liberty, and what is due process of law, are very difficult things to define, and there is room for a good deal of latitude in their construction, and some of the decisions of some of the courts have undoubtedly gone too far under this clause. But the well-settled rule is unquestionably as stated by Mr. Bryce, that the State Legislatures have succeeded to all the powers of the Parliament of Great Britain, except as limited by the national and State Constitutions.

I have examined all of Mr. Lionberger's citations to which I have access, and find them either misquoted or distorted by being taken from the context. One of his citations is from the case of Dash vs. Van Kleeck, 7 Johns. 477, in which Judge Kent says: "I must insist that our State Legislature, when acting within the pale of the Constitutions of the United States and of this State, has the same omnipotence which Judge Blackstone ascribes to the British Parliament." In opposition to Mr. Lionberger, I contend that all the courts of this country have always been in substantial agreement with Judge Kent on this point, and will close by citing a late deliverance of the Court of Appeals of New York. In the case of The People vs. Gillson, 109 N. Y. 398, decided in June, 1888, Judge Peckham says:

"It has been further held that every presumption is in favor of the constitutionality of legislative acts; that the case must be practically free from doubt before an act of the Legislature should be declared unconstitutional; that, as to our State Constitution, the question whether a statute is a valid exercise of legislative power is to be determined solely by reference to constitutional restraints and prohibitions; that it may not be declared void *because a court may deem it opposed to natural justice and equity*. . . . These principles have been frequently asserted in our courts, and are so familiar that a reference to particular authorities is not thought needful. They are good and healthful rules, and should be followed by all courts." A. P. R.

CORPORATIONS BEFORE THE INTER-STATE COMMISSION.

To the Editor of The Nation:

Sir: In your issue of April 11 a correspondent from Philadelphia, discussing the Inter-State Commerce report, complains as follows:

"The notion that they [the Commission] can regulate men's business better than the owners can, is quite patent. On page 4 there is asserted a right to inquire into the concerns of every corporation engaged in inter-State commerce, because that information will enable the Commission to deal more efficiently with the subject committed to them. Why confine this to corporations? If the reason or ground for the claim warrants the arrogation of the power, evidently not a dealer or trader exists whose business arrangements are not liable to be made public at the demand of this Commission."

Now, whatever differences of opinion may exist as to their practical working methods, it seems to me that one of the very strongest reasons for the existence of the Commission lies in that difference between the corporation and the individual, in point of legal status, which your correspondent overlooks. That individual liberty and privacy should be guaranteed and guarded is the very spirit of Anglo-Saxon law, and that the "business arrangements" of no dealer or trader should be "liable to be made public at the demand of this Commission," is most true. But is not this a childish exaggeration of the danger? and how does right of privacy apply to a corporation engaged in inter-State commerce?

To begin with, the corporation, as it exists in modern times, is a most un-Anglo-Saxon institution; and the theory of limited liability inherent in it is repugnant to that doctrine of personal responsibility for one's own acts which is a feature of the common law. But the main argument against the claim by the corporation to immunity from investigation is that so ably elaborated by Mr. Bonham in his recent book on 'Industrial Liberty.'

The corporation derives its franchises from the individuals composing the State, and is bound to hold and exercise these franchises as a trust for the public conferring them—a trust even more sacred than that for its stockholders. The individual citizen is the ultimate source of the existence of the corporation, and the franchises are granted in usufruct only, and can never lawfully be exercised in derogation of the individual citizen's rights. In the exercise of its power of eminent domain, the inter-State carrier can deprive an individual of property for which its money value is no compensation, and yet if one or more individuals complain that a corporation is abusing its franchises, the all-sufficient answer is that the State must proceed against the corporation for a forfeiture of its charter; if exception is made to this answer because no State can deal satisfactorily with an inter-State carrier, the presumptuous complainants are told that in a free country no Commission ought to arrogate to itself the right to "inquire into the concerns" of a corporation.

When Lord Chancellor Nottingham, the "Father of Equity," began to lay down and enforce the doctrine that a trustee, when thereunto called by a party interested, must give forthwith a detailed account of his stewardship, there were doubtless many easy-going trustees who regarded such proceedings as unwarrantable interference with individual privacy, and who, in conversation with their fellow-sufferers, probably referred to the Chancellor as "that fellow Finch"; but the right thing prevailed, and it is to be hoped that the doctrine of private trusts will ultimately be applied to that great trust involved in the exercise of corporate franchises, and that any party interested shall have the right to demand and to enforce his demand for a fair and impartial exercise of such franchises. Of course the law, as your correspondent states, is limited to the prevention of unjust discrimination; it was hardly contemplated, however, that the corporation should be the judge of what discrimination is unjust and what is not.—Yours truly, Joseph C. France.

Baltimore, April 15, 1889.

LAW AND PRACTICE IN IOWA.

To the Editor of The Nation:

Sir: Happening to be travelling in the State of Iowa three times within the last six months, I have had some little curiosity to observe how prohibition works. Prohibition prohibits about the same way that protection protects. Those who don't want liquor, don't get it, and those who do, get oceans of it. The aim of prohibition is, I believe, to keep those who crave liquor from getting it. It fails of its purpose in Iowa, as a rule, as far as my observation goes. I have noticed the same thing in Maine. For instance, one week ago to-day, in Burlington, Iowa, I was shown two saloons in "full blast." We entered from the street. The beer was sold over a counter and drawn from kegs. In fact, it was the kind of saloon you would see across the river in Illinois or Missouri.

As a rule, the Germans will have their beer, no matter what happens. The river counties voted heavily against prohibition, but the "back" counties—the farming counties—outvoted them.

A friend of mine in the wholesale grocery business told me that, in the old times, before prohibition, his customers used sometimes to request him to ship a gallon or so of whiskey with the consignment, but that now, no matter how frantic the appeal (and some I saw were indeed frantic and pathetic), neither would his house nor any other wholesale house ship one drop to the interior counties. "They voted to deprive me of my beer," said this philosophic German; "now let them go dry themselves."

My observation leads me to believe that the outcome of the whole matter is, that people who live in the large river towns get all the liquor they want, but the farmers go dry—and awfully dry they must get, too; for I have known them to drive forty miles to town for a drink. A Travelling Man.

Chicago, April 13, 1889.

TO CIVIL-SERVICE-REFORM REPUBLICANS.

To the Editor of The Nation:

Sir: It requires very little insight to see that the cause of civil-service reform is in a more critical situation than at any previous period in its history. It has been so often asserted that the true friends of the movement were mostly in the Republican party, that most people have come to accept the assertion as the truth. If, then, the glaring violation of reform pledges already perpetrated is, as it seems, to go unrebuked by those Republicans who have been wont to assume a leading part in reform movements during the past four years, the masses will take it for granted that the cause has gone by the board.

Four years ago, the *Independent* was honest enough to tell the people the truth about Blaine in plain terms, and to refuse to support him. Within less than three months of Harrison's inauguration, it was wise enough to utter words of warning against his selection for the Cabinet, and to predict the division of the party if the selection should be made. It was, nevertheless, made—in all probability had been made before the election—and the *Independent* has not a word of criticism to offer. Indeed, it has even discovered that Blaine's former unfitness has in some inscrutable way been transformed into wisdom, and it sees reason to hope for excellent results from the appointment. It criticised Cleveland very severely for allowing so many fourth-class postmasters to be removed to make places for inexperienced men, but assumes that Harrison has done right in appointing Van Cott, a mere politician, utterly inexperienced in postal affairs, to succeed Pearson, to whose excellent fitness it is compelled to testify in the very same breath. It is hardly necessary to remark, in the light of such facts, that all its former professions of devotion to reform are thereby proved to have

been basely insincere, and calculated only for party purposes.

Is the same thing true of many other prominent Republicans whose names will at once occur to the readers of the *Nation*? Are some distinguished Indiana reformers who supported Harrison so vigorously, and who, since his election, have erected so lofty a standard for him to follow, now going to imitate the baseness of the *Independent*?

Criticism from without will do very little good. If it does not appear, and that speedily, that there is a large body of men in the Republican party who are ready to censure Mr. Harrison as he deserves for such abuses as the removal of Pearson, it might as well be understood at once that civil service of the spoilsmen, for the spoilsmen, and by the spoilsmen has entered, by the grace of Mr. Harrison, upon an unprecedented career of prosperity. W.

THE RHINES BALLOT-BOX.

To the Editor of The Nation:

Sir: A word as to the Rhines Ballot System, of which a correspondent tells in your issue of April 18. It is of course encouraging to see so large a share of popular attention given to ballot reform that rival methods begin to compete for favor, and for this reason we welcome the efforts of Mr. Rhines, who is certainly sincere and well-meaning, to perfect the methods of secret voting in the direction of economy and accuracy. But I cannot refrain from pointing out that his apparatus, as it now stands, is open to the same strong objections that apply to the party-list system, embodied in the New York bill, and refused admission into the Massachusetts act. Wherever there is a column or list or group for all candidates of the same party (as there is in the New York bill and as the present Rhines method requires), you drag down the electoral system with at least three potent disadvantages:

(1.) You force every candidate to be dubbed either "Republican," "Democrat," etc., or "Independent," and thus deprive him of the right to stand forth, as a citizen, in his own name, free from any party stamp, and yet not obliged to content himself with the dunce corner reserved for obstinate "Independents."

(2.) You get into difficulties the moment there are two or more candidates (and when are there not?) who all wish to claim membership, as they have a right, in one party. You must either deny some of them this right, or you must cumber the ballot by printing more columns or additional party lists.

(3.) You foster the custom of blind adherence to party candidates, and undermine the independent judgment of the average elector by inviting him to vote at one stroke for a number of men, for offices requiring entirely different qualifications, on the one ground that they call themselves of a certain party. You deny him the advantage of being required to reflect at each vote he casts for each office.

These are not reasons which would have weight with the self-seeking class of politicians, but they count with some of us. At the risk of taking too much space, I will suggest a modification of the Rhines apparatus which will, I think, eliminate its party-list feature, and help to make it, what it apparently is capable of being, the modern, economical, and accurate apparatus (for it is merely a piece of apparatus—it cannot be called a system) for carrying out the principle of the compulsory secret ballot: Remove the party names at the head of the columns of buttons. Paste, or otherwise fix, across each button (which is large enough) the name of a candidate for the office represented by that horizontal row, and on each row arrange these names in alphabetical order. Let each organized party have a color (and on the inner face of the outside cover print a key showing these colors with the corresponding party names), and where a candidate wishes to appear under a peculiar name, *e. g.*, "Labor-Democrat," paste it just above his button, perhaps on it. Thus the voter does not vote by columns or by lists, but has each name before him, and votes by choosing that particular candidate. Moreover, each candidate can call himself what he pleases, and there may be more than one candidate of the same appellation. Nor is the mechanism of the tally-sheet affected in any way.

If Mr. Rhines's apparatus does mechanically as well as he claims (about which I know nothing), it ought to receive the attention of all interested in lessening the friction and expense of election machinery. It will doubtless receive the cordial condemnation of the printers whose business flourishes at election time. But it ought not to be employed until he consents to deprive it of its present objectionable feature. J. H. W.

Boston, April 20, 1889.

COLLEGE LECTURES AND EXAMINATIONS.

To the Editor of The Nation:

Sir: The method of instruction in vogue in our colleges is a compromise between the lecture system, the recitation system, and the so-called Socratic method. The necessary complement of the lecture system is the examination—in no other way is it possible to discover whether the student has made the required progress; and the longer and more searching the examination, the more full and more definite is the knowledge of the instructor about the real intellectual condition of the student. When the aim of the teaching is the mere imparting of knowledge, the lecture is certainly the most economical method, simply because the lecturer can condense several books into one address, and can compel hearing where he might not compel reading. Many arguments advanced against the lecture system hold good for preaching and speech-making of all kinds. Granted that there is a gain in having lectures printed (if one owns a printing-press), there are serious losses also; for if the printed lecture is delivered, there will be diminished attention in the hearers; if it is not delivered, its message will not come with so great force as from the living man. But there is a pedagogical value in hearing lectures and in taking notes of them: it is very desirable that a man should be trained to winnow the chaff from the wheat in an address—to pick out the salient points, and to carry with him the gist of a speech.

The recitation system, at its best, is merely a series of daily examinations. A term examination following these ought to and does have no terror for a diligent student. The real Socratic system throws the entire burden on the teacher; the pupil already has the knowledge, but must be aided to vivify it. Theoretically, such a system has no place for examinations. When each term's work stands for certain results, and the obtaining of these results is kept constantly in mind, whether the necessary imparting of knowledge is brought about in one way or another, the examination comes as a matter of course, and no one is troubled about it except the indolent and the incompetent. Examinations bring about a unification of knowledge with good students, and furnish a pretext for the retirement of poor ones. The charge that cheating occurs in some cases is no argument against examinations: dishonesty may be exercised on other occasions as well. The remedy lies in strengthening the moral fibre, not in removing the occasions for immoral action.

W. A. Merrill.

Miami University, April 15, 1889.

To the Editor of The Nation:

Sir: In connection with recent correspondence regarding college examinations, the fact may be of interest that for many years past at the Massachusetts Institute of Technology very full notes of most of the courses of lectures have been furnished to the students at first in "hektograph" and more recently in print, illustrated with all needed cuts. The original cost of preparation is assumed by the corporation of the Institute, and the students are charged with only the bare expense of printing. The saving of labor to the student is exceedingly great.—Yours respectfully,

Chas. R. Cross.

Rogers Laboratory of Physics, Mass. Institute of Technology, Boston, April 15, 1889.

To the Editor of The Nation:

Sir: The present abundance of books and facilities for printing have, no doubt, diminished the importance of the lecture system and restricted its field; but as pulpit and platform still have their use, and are not wholly superseded by the press, so perhaps this method of oral instruction, employed judiciously and in due measure, may not be without value, even in this progressive age. Decidedly, my own experience and observation incline me to think so. The live teacher is something more than a book; his spoken words have an effect that is largely lost in print. But to attain this result he must dismiss all thought of rhetorical display; he must not try to be eloquent; he must teach, not preach.

Is not a common cause of ineffectiveness in lecturing the habit of *reading* the lecture? When that is done it is, indeed, better to print. But where the instructor has a lucid knowledge and easy mastery of his subject, and can *talk* it (not spout it), effects can be obtained that cannot be had from books. Myself originally a sceptic in this matter, my views have been greatly modified by experience.

And why is the making and revising of notes necessarily such a waste of time? Is the mind idle because the hand is busy? On the contrary, when this work is properly done, the subject is at the same time mastered in a degree rarely obtained by mere study of books. I am aware that many subjects are not well adapted to this method, and that many teachers are ill qualified to use it, and sacrifice the students profit to vanity and folly. I recognize fully the value of the new methods that are growing in favor, but it does not follow that they will, or that they should, entirely supersede the old.

C. K. G.

Canton, N. Y., April 16, 1889.

MR. CHAMBERLAIN'S SCHOLARSHIP.

To the Editor of The Nation:

Sir: The better-informed among Mr. Joseph Chamberlain's fellow-commoners must occasionally be moved to smile, when he ventures on excursions beyond the sphere of present-day politics. It is not long ago that the Right Hon. gentleman was pleased to designate the Seven Bishops of refractory renown as "Nonconformists"; a term which, to characterize them, must be taken in a very Pickwickian sense indeed. Again, if the newspapers have not reported him amiss, in a speech which he made in the House of Commons yes-

terday, he signalized his acquaintance with literature by giving to Mr. John Bright the credit of originating the phrase "join the majority," in its euphemistic application. In his next vacation from manufacturing screws and elaborating sophisms against home rule, he might do worse than to dip into De Quincey, and, with the acquisition of some "small Latin," learn to weigh his rendering of *plures* against the mysterious abracadabra itself. *Tractent sua fabrilia fabri.*

Your obedient servant, X. Y. Z.

LONDON, March 30, 1889.

Notes.

ROBERT CLARKE & Co., Cincinnati, will shortly issue 'The Jew in English Fiction,' by Rabbi David Philipson, D.D. Marlowe, Shakspere, Cumberland, Scott, Dickens, Disraeli, and George Eliot receive attention in separate chapters.

W. S. Gottsberger & Co. publish immediately Georg Ebers's 'Margery (Gred): A Tale of Old Nuremberg,' translated by Clara Bell.

The Woman's Temperance Publication Association, Chicago, have in press 'Glimpses of Fifty Years,' by Miss Frances Willard.

A book of sermons, 'Living Questions: Studies in Nature and Grace,' by the Rev. Warren Hathaway, is announced by Fords, Howard & Hulbert.

The Dunlap Society will issue to its subscribers this year two parts of Mr. William Winter's 'Brief Chronicles,' and Mr. Lawrence Barrett's recollections of Charlotte Cushman, which will contain also a list of parts played by the great actress.

D. C. Heath & Co. will publish at once 'The Laws of Health in Relation to School Life,' by Arthur Newsholme, M.D., Diplomate in Public Health, University of London. The same firm have added to the "Old South Leaflets" Washington's inaugurals, and a letter of his to Benjamin Harrison, Govern of Virginia, in 1784, touching the development of the great West.

We should be glad to linger over 'The City of New York in the Year of Washington's Inauguration, 1789,' by Thomas E. V. Smith (who is, by the way, his own publisher); but in the interest of the prompt sale of the book we will say briefly that it is an excellent performance, by an antiquarian not crammed for the occasion, but saturated with local learning. Without pretence of style, or prolixity, without a footnote or a reference to authorities (without, alas! an index), Mr. Smith proceeds, in the most direct and orderly manner, yet not drily, to give a general description of the city, and then to picture in detail government, militia, politics; climate, dress, and customs; churches and clergy; amusements, education, literature and art; and ends with President and Vice-President, and Washington's inauguration. He ransacks the Directory to record the dwellers on the principal streets, Wall Street being in 1789 the most fashionable place of residence and the centre of political life for the new republic. The city fathers, the Faculty of Columbia College, the booksellers and what they sold to readers, the newspapers of the day, the plays of 1789, are all carefully set down, with here and there a spice of humor, and many a curious extract from public or private documents. We doubt if any work called forth by the approaching anniversary celebrati n will surpass this in quality, and we heartily recommend it.

The contrast between Washington's New York and Harrison's may be stu d, in connection with the foregoing work, by means of three sets of albertype views neatly bound as albums by Adolph Wittemann, 58 Reade Street. Central Park is the subject of one, the Brooklyn bridge of another, and the city in general of a third. Though a little cold, as prints, and lacking atmosphere, they are well selected and very fresh, even the new *Times* building being included, and the tangle of overhead telegraph wires, soon to disappear, being put on record. Strangers visiting the city could hardly do better than to carry away these albums as souvenirs. They are the first of a series which will be extended to all our large cities.

Canon Twells's 'Colloquies on Preaching' (Longmans, Green & Co.) is a good deal of a novelty in homiletic literature. The novelty is partly in the form—twenty more or less informal dialogues between all sorts of people upon the subject of preaching and preachers; and partly in the unusual frankness with which this clerical writer recognizes the limitations put in the modern world upon the clerical function, and the power he has of coming so near the real thought of a great many different persons about sermons. This is the most that can be said for the book, which is, in its main purposes, rather goody-goody and decidedly ineffective—the moral being that preachers ought to preach as well as they can, while listeners ought to exercise a great deal of patience. The writer seems to understand pretty well the attitude of Tennyson's Yorkshire Farmer and of Squire Western, but of the causes of the alienation of the artisan from the Church, or that of such a man as G. H. Lewes, he shows no conception.

It is a pleasure to receive the fourth and last volume of 'Battles and Leaders of the Civil War' (The Century Co.), and to find it equipped with a triple-column index of sixty pages. The value of this important work we need not estimate afresh, as there can be few readers who have not acquainted themselves with the magazine articles on which it is based. We should like to praise as they deserve the editorial labors of Messrs. Robert U. Johnson and Clarence C. Buel, but we doubt if anybody but these gentlemen can speak adequately on this point. The total product is creditable to all concerned, and has a distinct American stamp in its conception and execution—the *mechanical* execution, of cuts, paper, and typography, being in the very front rank of subscription publications.

The 'Encyclopædia Britannica' comes to a final end in an Index volume of 500 pages (Boston: Little, Brown & Co.; New York: Scribners), very open and clear, and on the face of it only a partial clue to the infinite riches of the twenty-four volumes. All the titles are repeated in the Index, and these are interspersed with names and topics not to be discovered in their alphabetical relation. On a page taken at random we have counted two new entries to every old title, and this proportion may very likely hold throughout. The Index repairs, so far as it can, the slight put upon the living in the scheme of this Encyclopædia, by summing up incidental references to Bismarcks, Darwins, Gladstones, Stanleys, and other notables of the period of the making of this extended work. It would be a superfluous task to criticise this Index, since we must take it as it is. No two makers of it would have agreed on what to insert and what to exclude. One unsuspected service it will render, and that is to correct the editorial shortcomings by bringing together references to the same facts, when inconsistencies and errors will duly appear. The first title we verified in this way showed in an incidental reference complete ignorance of the full and elaborate (biographical) article covering the same ground. At the close of the volume is given a list of contributors, in which many American names occur.

The 'Complete Index to *Littell's Living Age* (First Hundred Volumes),' undertaken by Mr. Edward Roth, 1135 Pine Street, Philadelphia, has just completed the fiction and begun on the geographical articles.

The classical antiquities of the Boston Museum of Fine Arts are assuming such proportions in numbers and value that the Curator's report in the Thirteenth Annual Report of the Trustees deserves attention, as indicating the lines of recent increase. In the torso of a male statuette from Naukratis, Mr. Robinson thinks he has a connecting link between Egyptian and Greek art.

The attractive appearance of the *Annals of Botany* (Macmillan) has probably had much to do with its remarkable success. In typography and plates, in the character of the paper, and the general symmetry of the page, it ranks among the best specimens of periodical literature. From the very first the editors have had a copious supply of material of a high order for their regular issues, and they have been discriminating in its use. One of the features which were viewed at the outset with some apprehension by many friends of the new venture, was the attempt to give the titles of all papers in current botanical journals; but this has been so well managed that all fear that the magazine would be in this way overweighted must have passed. The price of the *Annals* has been raised to thirty shillings per annum.

—It is almost a wonder, when one considers how many of the portraits of Washington the impending centenary has brought to public notice, that nobody, so far as we know, has thought of engraving and publishing the portrait by Savage, now in the possession of Harvard College. The late Mr. Josiah Quincy used to declare that this portrait corresponded to his recollection of Washington more closely than any other. It may be worth while to reprint from Mr. Edmund Quincy's Life of his father the following passage relating to it:

"I was curious to know how my father's recollections of the personal appearance of Washington agreed with the popular descriptions and pictorial representations of it with which we are all familiar. He was not an imaginative man, and never dressed his heroes in the colors of fancy. No man had a profounder reverence for Washington than he, but this did not affect his perceptions of physical phenomena, nor his recollections of them. . . . He maintained that Stuart's portrait is a highly idealized one, presenting its great subject as the artist thought he ought to live in the minds of posterity, but not a strong resemblance of the actual man in the flesh. He always declared that the portrait by Savage, in the College dining-room in Harvard Hall at Cambridge, was the best likeness he had ever seen of Washington, though its merits as a work of art are but small."

—The United States Cavalry Association, whose headquarters are at Fort Leavenworth, publishes there a quarterly journal, the March number of which contains a hundred pages of most excellent matter. One admirable military paper, although with no special bearings upon cavalry, is an intelligent explanation and discussion of the new German drill for infantry that is exciting so much interest in the military world. Its author, Lieut. Wagner, has had personal opportunity of seeing the German troops at work, and very lucidly explains, not only the general movements, but the principles governing them. Our National Guard, as well as intelligent civilians, would be interested and

instructed by the study of this paper. But the leading article, by Capt. Carr, First Cavalry, is a fascinating excursion into an almost unexplored field. It is a vivid description of cavalry life in the interior of Arizona during the three years 1866-68, filled with graphic descriptions of conditions now happily passed away, but whose very telling almost reëstablishes them before the eye. The paper was evidently read before the Association, and was probably written for the instruction of the younger officers and the entertainment of the older ones, and has the freedom of personal speech with the accuracy of the written line. But, whatever its origin, it is a marked success, both in its style and in its matter. Capt. Carr's first adventure with a pack train, the mysterious founderings of a raft in the Verde River, the description of Fort McDowell, where there was little difference by night from the temperature by day, "which for several months in the year averaged about 115° in the shade, or would have done so if any shade could have been found," explain very clearly some of the difficulties those men fresh from the Army of the Potomac had to meet in opening up that country. Perhaps the best illustration of the primitive condition of the region is the story that the chief of a band of Apaches, defeated by the troops from Fort McDowell, came in to make peace, and, as an evidence of good faith, offered to unite his three hundred warriors with the garrison for the purpose of attacking and capturing Fort Grant! Capt. Carr writes like a man who is telling what he knows, and in this case it is what few others, at least with the capacity to narrate, seem to know. People who wonder what the army has done in peace, people who forget we have an army, and foreign soldiers, whose service all lies within civilized areas, would find this article, as we have found it, entertaining to read, and, for our people at least, valuable to preserve. If this is a fair example of the proceedings of the Association, it is certainly a most creditable institution. The Journal is at Brentano's.

—On entering upon its second volume, the *Deutsch-Amerikanische Dichtung*, edited by Konrad Nies and Hermann Rosenthal, and published in this city, offers three prizes, of forty dollars each, for the best lyric poem, ballad, and novelette dealing with German-American subjects. The jury consists mainly of editors of well-known German-American periodicals, who, somewhat oddly, are reinforced by Prof. Franz Keim of the Gymnasium of St. Pölten, near Vienna, and Prince Emil zu Schönaich-Carolath, at present in Switzerland. The verses of this august foreign contributor are, in true German fashion, assigned the place of honor in the April number of the *Dichtung*, which contains, as its most characteristic feature, a poem on our civil war, by Theodor Kirchhoff, one of the best, as he certainly is the most prolific, of German-American writers, both in prose and verse. The poem, which forms part of the epic "Hermann," cannot be said to equal in value the author's descriptions of California life and scenery, and rather boldly suggests in its metre Schiller's "Glocke." The other contributions, while not particularly racy of the soil, are, we should say, fully up to the average poetry to be found in similar publications in the fatherland, and ring the changes on "The Song Treasures of the Rhine," "The Life of Man," "The Unfathomable," "The German Lied," etc. They are chiefly interesting on account of their geographical distribution, representing as they do the States of New York, Pennsylvania, Maryland, Ohio, Illinois, Wisconsin, Missouri, and California. Emil Rittershaus is the only transatlantic contributor of note in the present number. There is a sensible prose review of the German dramatic season in New York, which justly asserts that the Germans of Chicago and Milwaukee are treated to a better dramatic fare than are those of New York. The *Dichtung* is attractively printed, and on the whole is a creditable specimen of the literary activity of the Germans of this country.

—The Transactions and Proceedings of the Modern Language Association of America for 1887 have been issued in a volume of nearly four hundred pages. It presents first the papers read, secondly the proceedings, embracing the discussions upon them, and finally lists of members of the Association, and of colleges, with the various professors of modern languages in each. This volume shows a marked advance in the work of the organization over that of the earliest years. Pedagogics in its application to modern languages has properly shrunk to a more limited space; an effort to make propaganda for special theories and methods of education has disappeared, and the bulk of the present volume is made up of original investigations, many of which are scientific in character and valuable in results. The measure between criticism and original contributions is well preserved. These papers contain, in an increasing degree, studies of local dialects for which so vast a field is presented upon this continent not merely in English, but in the survivals of other languages of the early colonists. The most extended paper of this character is that upon "Bits of Louisiana Folk-Lore," by Prof. Alcée Fortier, presenting the text in the patois of some popular tales, songs, and proverbs of the negroes of Lower Louisiana, with a translation and commentary. The article on "Charleston Provincialisms," by Prof. Primer, deals a trifle too much with general phonetic statements, and presents a limited material. The article on the "Origin of the Teutonic Weak Preterit," by Dr. Collitz, is a fresh study of this important question, and worthy of careful examination. Other noticeable papers are by Dr. Lang upon the "Face in Spanish Metaphor," and upon "The Style of Anglo-Saxon Poetry," by Prof. Tolman. The article upon the "Seminary System in Teaching Foreign Literature" presents no methods which are not applicable to all instruction in literature and equally in vogue in all higher institutions of learning, even though not designated by the name "seminary." The author's statement regarding the amount of instruction in modern German by professors in the German universities whom he ranks exclusively as philologists, is based upon an imperfect acquaintance with the work actually done in the various seminaries. There are few universities where the seminary system is not applied to the study of modern German authors. The previous careful work in many gymnasia is apparently entirely overlooked.

—With the present year the Association has adopted a commendable change in issuing its publications. For several years there has been an effort to establish a review devoted entirely to modern philology and literatures. To meet this demand, and at the same time to avoid postponing the publication of all papers read before the Association until they can appear in a single volume, the Executive Committee has decided to publish the transactions in instalments, and to insert contributions which have not been read previously before the society. The first number has just been issued, under the title, 'Publications of the Modern Language Association of America, January-March,' vol. iv, No. 1. It contains eight papers of varying value—viz., on "The Language and Literature of Wales," by Edward D. Morris; "The Rhetorical Tendency in Undergraduate Courses," by Morton W. Easton; "Dante's Paradiso, Cantos xxiv–xxvi," by Edward L. Walter; "Notes on Elizabethan Prose," by James M. Garnett; "The Geste of Auberi le Bourgoing," by Thomas McCabe, with hitherto unpublished extracts of the poem; "Some Points in the Study of English Prose Style," by Henry E. Shepherd; and "Italo-Keltisches," by Richard Otto (in German). The *Modern Language Notes* has entered upon its fourth volume. The modest title does not express the value and character of its contents. It contains brief but important investigations, careful reviews, summaries of the leading French, German, and English periodicals so far as they relate to modern philology, an index to articles in philological journals, correspondence, personal items, etc. This paper has contributed its part to promote the scientific study of the modern languages, and forms a useful medium for all scholars and teachers of modern philology.

—We find in the *Deutsche Revue* for April a comment on some remarks of Prof. Wilhelm Dilthey on the material difficulties in the way of the student of literature of the "Genie-Periode," and the writer's plan for partially obviating them. His first difficulty arises from the fact that much valuable matter is in the hands of autograph collectors, whose treasures are often badly arranged, uncatalogued, and inaccessible even when the student knows the name and address of the owner of MSS., which frequently is not the case. And if, from the first, he renounces all hope of using such private property, and limits his field of work to the materials which, he may have heard, are to be found in the public libraries, this unadventurous path is not a smooth one. For the greater part the catalogues are not printed, and, aside from the necessity of going from place to place to find them, when found they are a torment to the mind; the MSS. being classified, not by periods or persons, but as folios, quartos, etc., according to the shape in which they are bound, or by their accidental position on the shelves. There is, therefore, no escaping the necessity of reading, from beginning to end, these various catalogues, the number of which is indefinite. Prof. Dilthey's plan is to have these scattered materials collected —by legislative action, we suppose—in Berlin, Weimar, and Stuttgart, and there stored and cared for after the manner of political archives. We are pleased to note that as preliminaries to this are mentioned not only careful searches throughout Germany, but also the preparation of indexes.

APPLETONS' AMERICAN BIOGRAPHY.

Appletons' Cyclopædia of American Biography. Edited by James Grant Wilson and John Fiske. In 6 vols. With Supplement and Analytical Index. D. Appleton & Co.

THE proportions of this work far exceed those of its immediate predecessors, viz., Allen's crude 'American Biographical Dictionary' (3 ed., 1857), Drake's 'Dictionary of American Biography' (1872), and Hough's 'American Biographical Notes' (1875)—each in one volume. Drake's Dictionary has been acquired by purchase, with the author's additions and corrections, and has been selectively absorbed into this new Cyclopædia (which equally embraces living persons, or "Men of the Time"). Yet neither Allen nor Hough has been super-

seded for men of minor importance; and when we compare Appletons' with Leslie Stephen's 'Dictionary of National Biography,' which in seventeen volumes has not reached the letter F, though it excludes the living, we must allow that the ambition of our American editors to produce a work in the same class with Stephen has not been gratified. Nor would we confine this remark to bulk alone, for it is clear on the most cursory examination that no well-digested scheme has discriminated for or against the admission of subjects, or controlled the style of the original contributions to Appletons' Cyclopædia—no just sense of proportion has determined limits—as in the case of the admirable 'Dictionary of National Biography.'

The principle of selection is fundamental, and it is well known that Mr. Stephen prints in advance in the London *Athenæum* lists of the names set down for volumes in preparation, inviting additions along with private information. No such precaution was taken by Messrs. Wilson and Fiske, who in another way sought to be as comprehensive as possible by giving a very liberal extension to family history. It results that while the greater personages are fully represented, those of lesser note, whom it is difficult to learn about, are too often sought in vain, while more obscure and unimportant men and women are recognized. One natural criterion, in the case of the dead, would be their relation to American history. To take a single State: while the first, second, and third Lords Baltimore are mentioned, no account is given of the fourth (Benedict Leonard), fifth (Charles), or sixth (Frederick)—in contravention, by the way, of the family principle on which the editors have laid so much stress. Nor is there any mention of Henry Harford, the last Proprietary; of Horatio Sharpe, who played a most important part in the French and Indian wars and the troublous times of the Stamp Act; of Thomas Cresap; of Eli Dagworthy, commandant of Fort Cumberland, James Innes, George Talbot, the hero of a tragic romance, and others who are certainly both more deserving to be held in memory and more likely to be inquired after by the student than many to be found in this Cyclopædia. In another section of the country, take William Dyer, first Secretary of the Colony of Rhode Island, a man certainly not memorable on that account, but the husband of the Quaker, Mary Dyer, hanged on Boston Common; she at least being too famous and too heroic to be omitted in a Cyclopædia like this—as she is. The Rev. Obadiah Holmes, a Baptist victim of Puritan theocracy, likewise deserved notice both for his *cause célèbre* and for his posterity.

Coming to more recent times, we cannot excuse the neglect of Isaiah Rynders—"Capt." Rynders in the days of the Empire Club, of Astor Place and abolition riots, Southwestern gambler before that, and meantime a weigher in the Custom-house for services as a political bully, and later rewarded with a Federal marshalship in this port—a typical figure in the evolution of American politics and in the history of Tammany Hall. Tweed is admitted, though he was the vulgarest of thieves. The period of the anti-slavery struggle is full of names associated with events characteristic of the two civilizations in conflict. Samuel Hoar's expulsion from South Carolina as a Massachusetts commissioner was one of these, and Mr. Hoar is not forgotten; but his fellow-commissioner, Henry Hubbard, sent to Louisiana at the same time and also forced out, if less violently, is not to be found, though he was a prominent figure in Western Massachusetts and in State politics. Capt. Jonathan Walker of Cape Cod, branded "Slave-stealer" on his hand for running off slaves from Florida while yet a Federal Territory, is rightfully remembered in the Cyclopædia; but his case pales beside that of two other humane mariners, Drayton and Sayres, who tried the same thing in the District of Columbia in 1848, and gave rise to the most exciting debates in Congress. A name among abolitionists which (in a like case) could not have been overlooked by Mr. Leslie Stephen, is that of the late Samuel E. Sewall of Boston, whose moral and material support of the movement represented by the *Liberator* cannot be estimated, and can hardly be exaggerated; who was also a prominent member of the bar, a Liberty Party candidate for Governor, a member of the Massachusetts Legislature, and constantly and effectively engaged in the amelioration of statute law. It is safe to say that his long life was worth more to his country than that of any or all the Sewalls since his great ancestor Judge Samuel Sewall, but he is not here recorded if only to amplify the distinguished family to which he belonged. Together with the "martyr Lovejoy" and his brother Owen, one would have looked to see mentioned another brother, Joseph C., a clergyman who cut something of a figure in politics, and who was the biographer of his brother Elijah as well as of that other martyr to slavery, Charles T. Torrey. In the list of educators we miss Cyrus Peirce, head of the first Normal School in Massachusetts, whose memoir was written by the Rev. S. J. May, at one time head of the same school; in prison reform, the Rev. John M. Spear, though his brother Charles is commemorated; in medicine, the Wesselhoeft family of Massachusetts, associated with the early triumphs of homœopathy in this country; in journalism and Bohemian literature, Henry Clapp, who was also a hanger-on of several reforms. Finally, the capriciousness of choice among living contemporaries may be illustrated in the case of a given college faculty—say Cornell, where Profs. H. C. Adams, T. F. Crane, Jas. Morgan Hart, and Homer B. Sprague are left one side, though Profs. Adams and Hart are members of other college faculties and well-known authors and editors of scholarly works.

The admission of foreigners "closely identified with American history" was a more delicate matter; yet it is clear to our mind that if Father Mathew's claim was to be allowed, much more was Kossuth's, but he is ignored. Both visits were political events, but the latter of the greater magnitude. Garibaldi's residence on Staten Island and military service in South America entitled him to the notice which is accorded, say, to Joseph Bonaparte. Dickens is excluded, though his 'American Notes' and 'Martin Chuzzlewit' were no mean factors in fixing American reputation abroad, and were promotive of a vast amount of discussion on this side of the water; so is Thackeray. Mrs. Trollope comes in, by virtue, perhaps, of her two years' residence in Cincinnati. Harriet Martineau is justly given a place; so is George Thompson, whose relations to the United States outweighed in value all those named above. Robert Owen, Frances Wright, Tocqueville, Michel Chevalier, Fanny Ellsler, Macready, are other names that have been looked after. On the whole, the editing of this department seems to us free from reproach.

The Cyclopædia embraces both continents, and we have made a hasty comparison of it, for South America, with Macedo's 'Brazilian Biographical Annual' (Rio de Janeiro, 1876, 3 vols.), an absurdly arranged and ill-digested work, but, we believe, accurate as regards facts. Of course it includes a great many merely local notabilities, whom one would not expect to find in such a work as Appletons', but there are others whose records show that they were men of as great or greater note than some whose names do appear in the Cyclopædia, but who have not found places. Thus, among prominent Brazilian statesmen we do not find in Appletons' any mention of P. de A. Bellegarde (1807–64), J. da C. Carvalho (1796–1860), J. F. Coelho (1806–60), M. J. Nogueira da Gama (1765–1847), J. J. da Rocha (1777–1848), a leader in the revolution of 1822 and afterwards Minister at Paris and Rome, P. J. Soares de Souza (1807–66). Among Brazilian authors we miss A. C. T. Bastos, Costa Pereira, J. Caetano da Silva, who was also director of the National Archives; A. J. da Silva, C. M. da Costa, and others who have written works of importance, as also many prominent generals, physicians, etc. All these seem to be fully as much entitled to a place in Appletons' as the following: F. de M. Franco, M. Saraiva, Licorda y Almeida, A. de S. Coutinho, J. C. Pereira, etc. When the names are given in Appleton they are, so far as our examination goes, given very correctly, and the dates are also generally correct, though we have noted a few discrepancies between Macedo and the Cyclopædia.

In the partition of labor, the chief editors acknowledge twenty notices each from their own pens, besides others not indicated, the number naturally diminishing as the work advanced. In assigning tasks to others, they have pursued the easy method of applying to writers who have already published full biographies of the persons in question. Thus, Monroe has gone to D. C. Gilman, Hamilton to H. C. Lodge, Jefferson to James Parton, Barlow to C. B. Todd, Henry Clay to Carl Schurz, Buchanan to George Ticknor Curtis, Lincoln to John Hay, Archbishop Hughes to J. R. G. Hassard, Com. M. C. Perry to W. E. Griffis, Theodore Parker and George Ripley to O. B. Frothingham, Garrison to Oliver Johnson; Frontenac, La Salle, and Montcalm to Francis Parkman; Sir Harry Vane to J. K. Hosmer, etc. We call this an easy method for the editors for obvious reasons, but it does not necessarily follow that the bookmaker is well qualified to condense his own labors; and what is almost certain is, that he will simply reproduce the favorable bias which is the motive of ninety-nine biographers out of a hundred. As a consequence, the larger and most important notices will be apologies—partisan and not critical, nor (best of all) simple statements of the essential facts, of which we have so many models in the 'Dictionary of National Biography.' Another class of attributions is easy and natural—sometimes inevitable—namely, to the kinsmen of the subjects of these sketches. Some may have published works, as Dr. Morgan Dix the life of his father, Gen. John A. Dix, or William Preston Johnston of his father, Gen. Albert Sidney Johnston; some may have them in preparation, as Luther R. Marsh of his father-in-law, Alvan Stewart. Some may vindicate an ancestor, as James Freeman Clarke Gen. Hull. Noticeably good is Jefferson Davis's account of his father-in-law, Zachary Taylor. In all these cases bias is to be understood, and the reader must guard against it as he is able. Finally, we have examples of combined hero-worship and intimate knowledge, as in T. W. Higginson's sketch of John Brown; or of pure friendship, as in Phillips Brooks's notice of Henry H. Richardson. Criticism, tempered by consideration for the living, is illustrated in Lowell's estimate of Whittier.

Many of the notices might with advantage have been subjected to stricter revision at the hands of the editors, and many trivial or irrelevant details might have been omitted. The

names are in most cases given with commendable fulness, and, so far as our examination goes, very correctly. In the arrangement of them, however, a serious mistake has been made, and one which detracts much from the usefulness of the Cyclopædia as a book of reference. Instead of following the alphabetical order of given names in arranging persons of the same surname, and allotting a separate notice to each, the editors have proposed to themselves to include all the members of one family in a single notice under the name of the oldest member of the family. Thus, under Chad Brown, the founder of the Brown family of Providence, are grouped the names of his descendants John Carter Brown and Nicholas Brown. Now, who that wished to find out something about John Carter Brown would think of looking under Chad Brown? Or who, looking for Gerrit Smith, would turn to his father's name, Peter Smith? The ordinary reader would look for Smith, Gerrit, in its proper alphabetical position, and, not finding the name, would at once jump to the conclusion that no notice of him was given. Unless the reader knows that the great-grandfather of Horace W. Smith was William Smith, he will look in vain for H. W. Smith. To be sure, the disadvantages of this method of arrangement are most serious in the case of the Smiths, but they are very evident in many of the commoner surnames, as Brown, Johnson, Porter, Robinson, etc.; and one is constantly liable to make the mistake of concluding that the person sought after is not included. There is a special cause for this in the fact that a man who has achieved moderate distinction is naturally desirous to lay as much stress as possible on his pedigree, and to honor his father by securing a place for him also. The trail thus proceeds from the quite obscure to the well known. As an attempt to combine the features of a genealogical record with the dictionary arrangement the scheme is a failure, and a great source of inconvenience to those who use the work. For the few more important family connections a separate entry, devoted wholly to showing relationships, would have been the most practical device. Moreover, the rule adopted is arbitrarily violated. Thus, while the Providence Browns are arranged as in a genealogical record, the Delaware Bayards are arranged properly, in the alphabetical order of given names, without regard to their relationship to each other, each one having a separate notice. With the Presidential Adamses a mixed practice is observed. To remedy this confusion one might reasonably expect an index, and in fact the last volume does contain one, but, most unaccountably, it expressly excludes names which occur as *subheadings*—the very ones for which it was needed.

Our excuse for indulging in these criticisms is the hope that they will be taken to heart by some future editor of a similar work. We have noted a certain number of errors, and several dates which we believe to be faulty; but such shortcomings were inevitable, and we pass them over. The publishers have, after all deficiencies are insisted on, rendered a very useful service by undertaking this Dictionary, even if it cannot be considered a great or scholarly work. In one particular they have given it a distinction which is perhaps unique, on so extensive a scale. Following the example of De Gubernatis in his Biographical Dictionary, they have illustrated the articles with a capital series of pen drawings from authentic portraits, and all by one hand, that of Mr. Jacques Reich, whose facility for preserving the likeness in miniature is certainly remarkable. Some faces, like Channing's for instance, have baffled him, but in general the portraits are recognizable and just. If there is any American iconographic storehouse to compare with this, we do not know of it. These small, inch-square heads compare favorably, on the average, with the steel plates which are reserved for the Presidents and other notables.

MORE NOVELS.

The Despot of Broomsedge Cove. By Charles Egbert Craddock. Boston: Houghton, Mifflin & Co.

A Daughter of Eve.—Better Times. By the author of 'The Story of Margaret Kent.' Boston: Ticknor & Co.

Lastchance Junction. By the author of 'Cape Cod Folks.' Boston: Cupples & Hurd.

A Latin-Quarter Courtship. By Sidney Luska. Cassell & Co.

A Shocking Example, and Other Stories. By Francis Courtenay Baylor. Philadelphia: J. B. Lippincott Co.

A Quaker Girl of Nantucket. By Mary Catharine Lee. Houghton, Mifflin & Co.

French Janet. By Sarah Tytler. Harper & Bros.

A Dangerous Catspaw. By D. Christie Murray and Henry Murray. Longmans, Green & Co.

A Fair Emigrant. By Rosa Mulholland. D. Appleton & Co.

For Faith and Freedom. By Walter Besant. Harper & Bros.

The Aspern Papers. By Henry James. Macmillan & Co.

THE history of literary life abounds in harrowing details of toil and hardship endured while writing up to a reputation. The diligence displayed by authors who have won reputation, in writing it away, is a modern phase, and has not received that attention which its frequent manifestation deserves. Suicide of reputation is the commonest crime of contemporary writers, committed alike by those who have reached in triumph the summit of Parnassus, and those who have been content to range themselves on the foot-hills. A few years ago the land rang with praise of Charles Egbert Craddock, the story-teller of the Tennessee mountains. Hers was the glory of the discoverer, and hers, too, the indisputable possession of the literary qualities perfectly adapted to making the most of her discovery. She unrolled as a scroll the hitherto unspoken mystery and majesty of her mountain fastnesses. Without sentimentalizing or romantically misrepresenting the mountaineers, she invested their meagre life and primitive character with a certain poetic dignity unconsciously borrowed from their natural surroundings. In a word, she seized and interpreted physical features, natural phenomena, and aspects of human life with a precision, vigor, and dramatic passion which rightfully entitled her to a wide consideration, closely resembling fame. Standing thus easily first among the writers of purely American modern fiction, unless she could sustain her position she should have rested on her laurels. But more zealously than any other she has applied herself to writing away her reputation. The first volume of sketches contained almost all that is good in her subsequent novels and tales, and much, very much, that is far better.

Candid criticism of her last novel, 'The Despot of Broomsedge Cove,' can be little more than a threnody, a weeping for Lycidas. Human history supplies a few themes apparently inexhaustible for the literary purposes even of writers as purely objective as is Miss Murfree. They are isolated actions, or a sequence of deeds so superlatively beautiful or heroic that their power to charm never diminishes, and each writer who describes them may make them as good as new. It ought to be unnecessary to point out that a life so circumscribed physically, intellectually, and spiritually as that of the Tennessee mountaineer, does not furnish such an enduring theme, and that the amplification and repetition of its limited possibilities is a waste of effort, sure to weaken the force of a first impression. Miss Murfree's last book is a tiresome sequence of repetitions and reproductions. Her lack of the constructive sense is painfully conspicuous in so long a novel. Every chapter or two she loses her grip of narrative. Probably feeling herself at sea, she grasps any sort of a float, and when she reaches firm land again, it is with an air of denying that she has ever been adrift, of warning people not to suppose that she hasn't known where she was all the time. Unfortunately, the reader cannot be so readily imposed on, as if her floats were subjectivities which are inestimable for bridging chasms and concealing a halting action. She cannot waft the despot, Teck Jepson, along from one arrogant deed to another by speculating about what he might have done if he had been born somebody else, or by disquisitions on the immutable laws of his being. She grasps for relief incidents and characters removed from his sovereignty, and, through them, returns at distantly recurring intervals to touch indistinctly the keynote of her theme.

Her inability to sustain character is as fatal to novel-writing as her failure in construction. When Jepson is introduced, the reader feels a character arrogant, positive, narrow, and prejudiced. He understands that Jepson's imagination is aflame with the glories of Solomon, the trials of Moses, the atrocities of Jezebel and Ahab, as luridly depicted by the circuit preacher. He knows that Jepson believes himself to be about the finest fellow on the mountains, and anticipates the satisfaction of seeing him ride for a fall, or at least of beholding him purged by fire. But Miss Murfree snubs her reader's forecast and discredits his intuitions. Jepson's connection with the tragedy of the tale is accidental; it does not affect or develop his character; he is discarded for other interests, and what suspense there is hangs on Marcelly Strobe's affection for her father. Marcelly is a snappish but attractive maiden; her filial devotion is insistent, yet when we set out to read about a despot, we are not pleased to be put off with anxiety about the temporal welfare of a half-cracked constable.

The minor incidents and separate interests of the novel are very numerous, and irrelevant to its presumed original design. Though plainly makeshifts, they are still not such palpable padding as are the descriptions of natural scenery and of the varying behavior of the elements. The mountains, the mists, and, with less natural justification, the moon, are always there, in Tennessee, and Miss Murfree uses them "for all they are worth." Language is both impoverished and enriched in their description, and wherever the sound is most impressive, there is wisdom in suppressing curiosity about the sense. As the cantatrice steps gayly to the front, setting the echoes flying with roulade or bravura, while the tenor lies gasping by the wings with a dastard's dagger in his breast, so Miss Murfree leaves Teck and Marcelly in most critical agitation, to discourse on the "incomparable glister of the sweeps," the "gorgeous, albeit noiseless splendor of

sunset-tides" (where or when was the sunset ever *noisy*?), the "mellow" moon, the "lucent, yellow" moon, every kind of moon that ever was and that never was beyond the peaks and ranges and lateral spurs of the Tennessee mountains. Just when feeling is tensest, she dwells on the vocal exercise of frog and katydid, and lingers to note the song of the cicada, "charged with somnolently melodious post-meridian sentiment," the hay "tending here and there to the nullity of invisibility," and a cloud with "tenuous trailing cirrus effects on its verge." Miss Murfree has always overdrawn scenic effects, and has now reached a stage of abandon to spectacle beside which even Mr. Black's ecstasies over the Western Isles are cold and prosaic. Her attachment to long and unusual words has deepened, and her peculiar use of the word "null" in itself furnishes matter for an essay. It is an ungrateful task to criticise Miss Murfree with a minuteness which appears captious. The best excuse is that unconsidered trifles have as much to do with the making of a good book as with the making of human happiness. The mountains and the moon, "survigorous" and "stiddier' and "catawampus," may have lost their charm, but it is hardly possible that Miss Murfree's power to make us laugh or cry is exhausted.

Without insinuation of comparison between the character or quality of Miss Murfree's work and that of the author of 'A Daughter of Eve,' it may be said that he is one of her rivals in the industry of writing away a reputation. His specialty is the Mammon worshippers of New York, and his last effort a dull réchauffé of former clever treatises on his pregnant theme. The Barrymores preying upon Mr. Litchfield, a rich relation by marriage, are not wily or ingenious enough to amuse, nor are they wicked or base enough to excite keen contempt. Perez Galdós, in 'Leon Roch,' describes an exactly similar situation, but how different the method and the effect upon the reader! Every attack made upon Leon Roch's purse by his wife's relations is superficially a bit of brilliant comedy, while the utter worthlessness of the birds of prey is so unmistakably insinuated that the reader is wrought up to detestation of the whole shameless flock. Nerve and intensity must be thrown into the delineation of social parasites and leeches if the performance is to be anything but futile. Limp representation palliates their depravity and venom. The Barrymores are shabby and sordid, but neither funny nor abominable. The hero, Mr. Merion, is the most amusing of the characters, and suggests 'A Son of Adam' as an appropriate alternative title. Never a woman tempted him but he fell. He loves simultaneously all the available women, three in number, and is of them beloved. Running from charmer to charmer, patting this one on the head, folding that one to his breast, he is finally trapped by a simple village maiden, Dorothy, after a passionate controversy about which shall kneel at the other's feet.

The volume of short stories by the same author included under the title, 'Better Times,' were written, he says, in his younger days, "in the better times when stories made themselves out of instinct and sympathy, not from experience and observation." Undoubtedly they belong to the first hours of the modern realistic movement in fiction, when actual life was permitted to furnish materials for the story from beginning to end—excepting one chapter or page: the conclusion was beyond the author's control; it was fixed by the law of custom and as yet unalterable. In defiance of logic, probability, or possibility, the right man must marry the right maid; poverty and sorrow could be but temporary inflictions on the virtuous to test their mettle, and the monstrous career of the vicious must terminate ingloriously. People in those days could probably look facts in the face as boldly as now; they knew how crooked the course of life persistently runs, and how ill-regulated are its finalities, but they had still some faith in the Balm in Gilead, and were resolved that it should receive honorable notice in their fiction. On the whole, they were better times, for both the average story-teller and reader. The former had only to make a beginning and get to the prescribed end by any road he might devise; the latter, no matter how he cavilled or yawned by the way, knew that at the last station perfect satisfaction would permeate his being. Sentimental, romantic, illogical, these optimistic stories of better times may be, yet they are to-day pleasanter reading and more edifying than are the shifts of the necessitous Barrymores and the amorous perplexities of Mr. Merion—a fabric constructed, we are free to suppose, from the author's experience and observation.

The reputation of the author of 'Cape Cod Folks' as a writer of realistic fiction was established, it will be remembered, by a suit for libel brought against her publishers by an actual native of the Cape. He believed that in this sprightly narrative he had been injuriously lampooned. No such terror menaces the publishers of 'Lastchance Junction.' No man could endure existence when self-esteem had sunk so low that he imagined himself a model for any character in this wild and terrible tale. The exact geographical position of Lastchance Junction is cautiously hidden in phrases. It is "thousands of miles from here" (*here* being a clearing at the base of a range of the Rockies); it is the "grandest place God ever made"; it is the "furthest territory that only we, a few people who belong together, know about." The select few knew each other familiarly as "The Busted," and there was a cataract at Lastchance tumbling hundreds of feet and singing as it fell—"Welcome! welcome! ye Busted ones." The Busted were intimately bound to each other, and, though imperatively "wanted" in other quarters, were fully aware that the welcome accorded them by a fastidious civilization would not shape itself tangibly in gold rings and fatted calves. They agreed together like birds in their little nests, and the eye of distrust rested on only one of their number, who had apparently become "a busted one" by ways so unspeakably bad that they are only darkly hinted at. This *suspect*, Gordon Ferris, was a beautiful youth and the pride of Colonel Bloomer's open-air circus. By his great skill with the lariat and in riding a raging, bellowing bull, he captured the heart of Miss Lucy Dorne, who, with her highly cultured family, was casually looking on at the ring near the base of the Rockies. Of the lady's antecedent history we are informed that "she had seen many people mangled and torn the world over for her entertainment"; therefore we are not surprised when she abandoned the inanities of wealth and station for so accomplished a mangler and tearer as Mr. Ferris. We forbear to dwell upon the experiences of the "pride of the Dornes" become Mrs. Ferris; they are awful as a nightmare of a ghoul after a midnight banquet, and beyond the pale of human judgment.

The stories collected under the title, 'A Latin-Quarter Courtship,' properly belong, with one exception, to that column of a village paper sacred to the imaginative effusions of local genius. No rustic maiden would blush to own them, and her relations would feel repaid for the expense of her summer at Chautauqua by the printed evidence of her fluency in the French tongue. Not that the stories are written entirely in French; but that precise and polite language is resorted to when it is necessary to express such an involved idea as that a certain room is on the fifth floor to the left, or that a maid believes her mistress to be ill. The courtship is indebted for its Latin-Quarter flavor principally to the dazzling proficiency in a strange tongue of the people interested directly or indirectly, though something is also due to a guide-book intimacy with the streets and suburbs of Paris. It is to be supposed that the lover, Ormizon, wrote his successful novel in French, because his English is so very queer, and one cannot believe that a gentleman who reflected coldly, such and such a thing "cannot do no possible harm," had reached perfection in English literary style. The redeeming feature of the volume is "Mr. Sonnenschein's Inheritance," a Hebrew character sketch. Mr. Sonnenschein is a Schlemiel, and a Schlemiel is a creature who can never have good luck, but is cheerfully resigned to bad. The sketch is vivacious and amusing, and, granting the character, there is nothing improbable in the Schlemiel's management of his inheritance.

Several of the ill-assorted sketches gathered under the title 'A Shocking Example' may have made their first appearance in one of those Ladies' Journals the continued existence of which shows that female intelligence is still largely unimpaired by the insidious attacks of the "higher education." "Robert's Wife" is a fine specimen of Ladies' Journal twaddle, and "An Incident of English Railroad Travel" lags not far behind. "The Cold Punch Act" has some force and real life, but is destroyed by the vulgar extravagance of the catastrophe. "Craddock's Heldest" is a pathetic sketch of the precociously mature child of a London char-woman, slightly overdrawn. The essay on "Table Talk" is strained, and the reader is invited to accept conclusions for which, to say the least, the author's original propositions have not prepared him. And what is the excuse which a sensible writer in the English language offers to herself for exclaiming, at the end of a respectable essay, "Causons-nous donc mes frères; ainsi soit-il!"? Even Luska's brilliancy in French pales before Miss Baylor's, and when both French and English are inadequate for her needs, Spanish answers promptly on call. For the purpose of writing well in English, it occurs to us that the time necessarily expended in acquiring about enough French and Spanish "to last over night" might have been better employed in the study of the great English writers whose names Miss Baylor rattles off so glibly. An hour or so devoted to Coleridge might, at all events, have saved her from presenting in quotation (page 65) an extraordinary version of the famous farewell to that "good man," Sir Arthur O'Kellyn, which properly runs thus:

> "The Knight's bones are dust,
> And his good sword rust.—
> His soul is with the saints, I trust."

The sketch of the priest, Miguel Hidalgo, who died for liberty in Mexico in 1811, is sympathetic and strong. For the author's sake it is a pity that so good a bit of work should be bound up with what is trivial and unworthy of fine companionship.

'A Quaker Girl of Nantucket' is a distracting jumble of the old and the new, the modern realistic method and the by-gone artificial, romantic conventions. The aunts, Hepsy and Dorcas, and Obed Swaine belong among the living whose earthly abode is on Nantucket Island, and no people could

more strongly object to being dragged into such a mesh of ridiculously improbable circumstances as those here set forth with much prolixity. Some episodes recur in fiction with the unfailing regularity of the new moon in the sky, but it is long since they deceived us about their brand-newness, lacking, perhaps, the serene effrontery of the clever moon. Past hope of furbishing into semblance of newness is that confusion of identity arising from a wreck at sea and the rescue of two tender babes of parentage unknown. The author here does honor to the antiquity of the complication by omitting none of the well-known details. By a series of inconsequent events, wrong is at last made right, but for the reader dark is never made light. To the end, whys and wherefores remain unexplained and inexplicable.

In 'French Janet' the mystery surrounding motive and reason is similarly deep, and the writer has not the excuse of inexperience for working without design. The first part, describing the Scotch family of Windygates and the visit to Paris of the young Windygates, where he was to "acquire the last French polish" and not to be introduced to French vices, is very smooth and agreeable narrative. Through the intercourse of the Scotch boy with the De Châlons family, a vivid impression is given of the high distinction, with its taint of corruption, which characterized the great French nobles in their last hour of power. So far the author is on sure ground; but when she converts, apparently capriciously, what promised to be a fine tale of worldly intrigue and passion into a ghost story, she flounders about in the most helpless manner. A ghost story rationally explained is always disappointing, but a ghost story for which what may be called a working hypothesis cannot be constructed is insulting. French Janet's ghost does things of which no one could ever believe a ghost capable, and disregards all proper ghostly functions. She is a miserable travesty of a ghost, and greatly discredits the wit and wickedness which inspired her natural body.

There is a moral motive in 'A Dangerous Catspaw' that is not nearly so clear and unimpeachable as the narrative. Mr. Murray desires to tell us that, sin being a matter of temptation, any one may fall, and therefore no one should pride himself on his virtue, nor judge his brother harshly. To maintain this position great care should be taken in the selection of the sin and the sinner. Mr. Murray's combination is weak. Mr. Wyncott Esden, a gentleman by birth and breeding, an astute lawyer, and a man of comparatively blameless life, steals jewels valued at thirty thousand pounds, because he is in temporary need of money and has a "jimmy" in his pocket, a token of gratitude from a desperate criminal acquitted by his forensic eloquence. Decidedly the temptation does not excuse the crime. It may be that, after his confession and suffering, Esden might sooner be trusted than "many men who have led fairly blameless lives," yet it is exceedingly doubtful whether meeting an enemy on a dark and lonely road, and having in his pocket a pistol or knife or other suggestive weapon, he would permit that enemy to pass by in safety. Letting the moral alone, the story is good of its kind, told directly and naturally, with no waste of words.

Easy and unaffected expression is the quality that makes English novels of the poorer sort more acceptable than American to people with any appreciation of literary style. 'A Fair Emigrant' is an example of the wretchedest kind of English fiction, though the central situation is novel. The fair emigrant does not land at Castle Garden friendless and homeless, her fortune in her face. The American daughter of an Irish father, she reëmigrates to unhappy Erin, her fortune in letters of credit representing bundles of bonds. Her double mission is to establish her father's innocence of the imputed crime of murder and to introduce into Ireland American energy and improved agricultural implements. The train of events is romantic and more or less foolish, but they are smoothly run together, and it is possible to follow them without being irritated by jarring machinery and exasperated by badly made sentences and strained, meaningless phrases.

A flowing, apparently effortless style is the abiding merit of Mr. Besant's novels, and though he has told so many stories, he never repeats himself. When the life of to-day offers no attractive subject, he cheerfully falls back on yesterday. In 'For Faith and Freedom' he selects an exciting and dramatic yesterday hitherto overlooked by novelists. The landing of the Duke of Monmouth at Lyme with intention to rescue Protestant England from the rule of his uncle, James II., and the vengeance wreaked on the West by the cruel and gloomy Stuart after his victory at Sedgemoor, furnish historical foundation for a fiction full of movement and human warmth and color. The incidents may have been suggested by a passage in Green; at all events, they are summarized by him when he says:

"The Chief Justice, Jeffreys, was sent to earn the 'Seals' by a series of judicial murders which have left his name a byword for cruelty. Three hundred and fifty rebels were hanged in what has ever since been known as the 'Bloody Circuit,' while Jeffreys made his way through Dorset and Somerset. More than eight hundred were sold into slavery beyond sea; a yet larger number whipped and imprisoned. The Queen, the maids of honor, the courtiers, even the Judge himself, made shameless profit from the sale of pardons."

Cold and matter-of-fact as the historian's statement is, it moves an emotion of indignant horror which is intensified by the novelist's art that vivifies the general and the remote, epitomizes widespread suffering, and individualizes the wrongs endured by a multitude.

The hearty humanity and physical vigor of Mr. Besant's work are in striking contrast to the intellectual subtlety and supersensitiveness of Mr. James's, yet the authors meet on the common ground of all first-rate craftsmen. They never shirk or botch; they never discredit themselves or their trade. The motive of each of the three stories included by Mr. James under the title 'The Aspern Papers' is so light as to be whimsical. Robust people, doubtful of the depth of emotion which doesn't shriek, incredulous of intellectual tragedy, unsusceptible to comedy not grinning or roaring, can hardly find them worthy even of august disapproval. A man who cannot find life worth living unless he shall get possession of certain papers relative to the life of a poet long dead is, to such, a fool; a woman, moved by sentiment reminiscent of her youth to tell damaging truths about her own daughter, is a monster; another woman who kills herself from fear of her brother's criticism of her husband's book, is an impossible creation of a morbid brain. Judgment rests on the facts in the case, and an author tried by such a damaging array of facts must expect to be pronounced a lunatic by a commission of his whole possible public. But the facts of incident or event are really of the slightest importance for passing judgment on Mr. James's work. He stands or falls by the truth, the refined accurate truth, of his interpretation of the thought, motive, impulse, caprice of the people whom he confronts with any problem of existence, temporary or permanent. In these stories his interpretation is admirable, cold, polished, making no concessions to popular conceptions of what is nice and proper, or even probable according to sentimental or provincial notions. The stories have the worldly touch just as surely and unaffectedly as Mr. Besant's novels have the broadly human touch; and though they appeal only to a restricted class, they will gratify and satisfy that class exceedingly.

Lives of the Fathers: Sketches of Church History in Biography by Frederic W. Farrar, D.D., F.R.S. 2 vols. Macmillan & Co. 1889.

No English writer on Church history in our day is sure of a wider audience than Archdeacon Farrar. His previous works, especially his 'Life and Works of St. Paul,' have given him a strong hold upon that great body of readers who desire a large and eloquent presentation with as little as may be of the machinery of scholarship.

The present volumes on the 'Lives of the Fathers' will go far to strengthen this reputation. They are the work of a man who has read what the fathers wrote, and who is familiar with much of the recent literature about them, but who contrives to present the result of wide study in a popular and taking form. Profound they are not and are not meant to be. They touch upon questions of the higher criticism only where it is necessary for the sake of clearness. Beginning with a brief sketch of the literature known as the writings of the "Apostolic Fathers" and of its semi-mythical authors, Dr. Farrar takes up in succession the lives of the most noted Christian writers from Ignatius to Chrysostom. These sketches taken together form thus an almost complete Church history of the first four centuries. If ever the biographical method may properly be used to convey historical information, it is surely in connection with the early Church, for there the history of the institution is hardly more than that of the leaders who were helping to make it. Nor is the biographical method here pushed to the extreme; but the man is, in each case, taken as representing some phase of the general life of Christendom. This plan saves the author from many of the dangers of the biographer, but he does not escape them all. He is, after all, dealing with a series of heroes, and he defends them sometimes with the true apologetic zeal. For instance, he goes no further, in speaking of Justin Martyr, than to say that he was "not a very powerful reasoner," where one familiar with some of Justin's vagaries, as, for instance, his explanation of the symbolism of the cross, can hardly do otherwise than think of him as pretty nearly deprived of reason altogether.

On the other hand, we see, together with great admiration for orthodoxy, the greatest fairness in the treatment of heresy, as, for instance, in the case of the Montanists, where Dr. Farrar shows very beautifully the essential truth retained by this most bitterly persecuted sect long after it seemed to be forgotten by the dominant orthodox party.

In the proportion of space allowed to the different writers, Augustine and Jerome are, naturally, perhaps, the most favored. Their voluminous writings and their great personal influence make them central figures during most important crises of the Church's life. We are surprised, however, to find the great Alexandrians, Clement and Origen, dismissed with a few pages. One would hardly get an impression here of what we believe to be the truth, that these two writers did more to maintain and transmit a lofty spiritual conception of

the foundation dogmas of Christianity than any others. They have been obscured, it is true, by later dogmatism. Sacerdotalism and ecclesiasticism in all its forms have done their best to put doctrines of secondary importance into a foremost place; but the Christian world is at last waking up to the essential loftiness and purity of the early Greek theology, and the incrustations of the Latin school are being removed. Dr. Farrar takes sufficient pains to defend Origen from the charges of heresy, but compresses into a very brief space the account of his influence, and hardly suggests the comparison with the Latin theology to which we have alluded.

Excellent chronological tables and a good index complete this most useful contribution to the popular study of early Church history.

The Telephone. By Wm. Henry Preece, F.R.S., and Julius Meier, Ph.D. London: Whittaker & Co.; New York: D. Van Nostrand. 1889.

THE work before us constitutes a valuable contribution to applied science. The authors have gathered together, and arranged in clear and convenient sequence, the main facts in the history of the development of the telephone and almost all the forms of apparatus which are likely to retain a permanent interest. They have wisely kept aloof from questions of priority, and have given what is fairly to be considered an impartial history of one of the most beautiful of human inventions. The first recorded plan for the transmission of speech to a distance by means of electricity is due to a Frenchman, Charles Bourseul, who in 1854 published a paper upon the subject, in which the theory of such transmission is given with perfect clearness and correctness. Bourseul appears to have made experiments which promised ultimate success. It is certain that he actually achieved nothing which deserves to be remembered, but it is something to have foreseen the possibility of such results as we now have. Next, in 1868, came Philip Reis, who went so far as to construct a telephonic transmitter and receiver which—whether intended to transmit speech or not—actually did transmit distinctly audible words and even sentences. His place in the history of the telephone is that of Jouffroy in the history of the application of steam to navigation, of Walter Hunt in the invention of the sewing-machine, and of scores of others who thought out problems in applied science, devised means for carrying their ideas into execution, and in the end left nothing but a record of intellectual success and practical failure. The story of Bell's invention is simply and clearly told. Those who wish for more elaborate and minute details of the history and of the claims of others to a greater or less share of credit in the invention, may be referred to the voluminous reports of the various legal struggles in our own country, which in this case, as in the case of the electric telegraph, with an incredible amount of chaff, contain many grains of real value and interest not to be found elsewhere.

Every electric telephone consists essentially of a transmitter and a receiver. Our authors treat these first in order, and we have clear descriptions and excellent woodcuts of a large number of very interesting and suggestive forms of apparatus. Among them we regret not to see noticed the extremely ingenious devices of our countryman, Dolbear. All things considered, Bell's receiver is still practically the best; his transmitter was long since replaced by better forms. The different kinds of carbon transmitter, depending upon a fundamental principle due to Du Moncel, are described with much detail. We have sufficiently full accounts of various abnormal forms of telephone, of which perhaps the most remarkable is the photophone of Bell and Tainter.

It will readily be understood that the practice of telephony has now become a highly organized system, with a multitude of details, major and minor, each one of which has been worked out with great patience and ingenuity. Inventors of all civilized nations have devoted their attention to overcoming difficulties and improving apparatus. We have ample details of these contrivances, and the American, English, French, German, and Swiss systems are spread before us for study. Messrs. Preece and Meier have executed their very laborious task with conscientious care, and have produced a model work. We hope to see the subject of telegraphy treated with equal ability.

The Laws of the State of New York relating to Building Associations. By Willis S. Paine, LL.D. L. K. Strouse & Co.

THE rapid increase in the number of building and loan associations in this State makes such a work as has been prepared by the Superintendent of the State Banking Department timely and valuable. It contains an introduction which discusses this form of coöperation, and points out possible dangers of management, giving the text of the report made on the subject in 1856 by a committee of the Assembly, who found the associations then existing in so perilous a condition that they recommended a repeal of the law governing their organization; a chapter on the "Character of Coöperative Building and Loan Associations," the text of the acts of 1851 and of 1887, and notes on each section of these acts, explaining their requirements and pointing out where these associations are amenable to the general corporation acts of the State.

The author's introduction will go far to remove the impression that he is unfriendly to the building and loan association system, as was inferred from his remarks on the subject in his annual report of this year as Bank Superintendent. He says that such associations "become the foes of communism, creating habits of accumulation and assuring the privacy of homes," and that they "become indirectly valuable moral agencies as a partial solution of the tenement-house problem"; pointing out at the same time that "they may, if loosely managed, prove a serious injury to the frugal and industrious wage-earners who invest in them." But that he has not mastered the subject is evident from his remark that "terminating [as contrasted with serial] associations are more popular and common in the United States, and the other classes are comparatively rare." This is a misstatement, and the inference to be drawn, that the terminating system is the better one, is misleading. The serial plan possesses so many advantages that only a lack of knowledge of the subject would lead any body of coöperative economizers to organize under the terminating system.

BOOKS OF THE WEEK.

Abbot, E. The Authorship of the Fourth Gospel, and Other Critical Essays. Boston: George H. Ellis.

Address X. Y., *The Nation.*

The Nation.

NEW YORK, THURSDAY, MAY 2, 1889.

The Week.

LAST year we heard announced the theory of the Republican party as to the way the public service should be administered; this year we see exemplified the practice of the party. It is interesting to contrast promise and performance:

The spirit and purpose of the reform should be observed in all Executive appointments; and all laws at variance with the object of existing reform legislation should be repealed, to the end that *the dangers to free institutions which lurk in the power of official patronage* may be wisely and effectually avoided.—*Republican National Platform of 1888.*

In appointments to every grade and department, fitness and not party service should be the essential and discriminating test, and fidelity and efficiency the only sure tenure of office. *Only the interest of the public service should suggest removals from office.—President Harrison's Letter of Acceptance.*

POST OFFICE DEPARTMENT,
OFFICE GENERAL SUPERINTENDENT RAILWAY MAIL SERVICE, WASHINGTON,
April 13, 1889.

Mr. J. T. Loving, Richmond, Va.:

SIR: Superintendent Vickery has referred to this office your letter of the 11th inst., asking the reasons for your retirement from the service, and in reply would state that *the action was taken in consequence of no fault on your part, or for reasons affecting in any way your character or standing as a citizen.*

The reasons for your retirement were of a political nature.

Very respectfully,
J. L. BELL,
General Superintendent.

The *Watchman*, the Boston organ of the Baptists, asks for a suspension of judgment towards President Harrison, on the ground that he has been only two months in office, that the pressure of office-seekers has been very great, and that his "honesty" and "his equipment generally to meet the demands of his high office" are undoubted. It therefore calls on us to yield him the "awards enjoined in the New Testament," even if he does "err, now and then, in judgment and in resulting action." A plea for delay is always allowable, but it should, to be really effective, be accompanied with some distinct definition of the period of probation to which a man like President Harrison is entitled. How long must we wait before criticising him or making up our minds about him? Three months? Six? A year? We ought to be told. Moreover, criticism of this sort has the fatal defect of overlooking the fact that public office is a public trust, and in all trusts the obligation of good behavior is as strong the first day as the last. The *Watchman's* notion, apparently, is that the Presidency is an educational establishment in which dull men may learn their duties at their leisure. It is nothing of the sort. It is an immense charge of other people's affairs, about which no man has a right on any plea to lie or cheat *even once*. The first time Gen. Harrison broke his pledge by *knowingly* making a bad or unfit appointment, or a corrupt or causeless removal, he committed the unpardonable sin of politics. Mistakes are always excusable, but a wrong act done knowingly is not a mistake; it is a crime. All this ought to be "familiar learning," as the lawyers say, in the offices of religious newspapers and in pastors' studies.

Two passages in the inaugural address of President Wm. Henry Harrison have been strangely overlooked by his grandson and successor, President Benjamin Harrison. One of these is his warning against all attempts to subsidize the press through the use of Executive patronage. These golden words are found on page 234 of the *Congressional Globe*, vol. 7 (March 4, 1841), viz.:

"There is no part of the means placed *in the hands of the Executive* which might be used with greater effect, for *unhallowed purposes*, than the control of the public press. The maxim which our ancestors derived from the mother country, that 'the freedom of the press is the great bulwark of civil and religious liberty,' is one of the most precious legacies which they have left us. *We have learned, too, from our own as well as the experience of other countries, that golden shackles, by whomsoever or by whatever pretence imposed, are as fatal to it as the iron bonds of despotism.*"

We commend this sentiment not only to President Benjamin Harrison, but to the editors of the several papers who have received appointments at his hands, viz., the New York *Tribune*, the Cincinnati *Commercial Gazette*, the Iowa *State Register*, the Indianapolis *Journal*, the Utica *Herald*, the Oshkosh *Northwestern*, the *North American Review;* also the numerous weekly papers in the country districts whose editors have become postmasters. We recommend that they all give one insertion of this paragraph in their newspapers, not as a Reading Notice, but as selected matter having a fresh interest after the lapse of nearly half-a-century.

The other paragraph from the same inaugural address is found on the succeeding page, viz.:

"It was the beautiful remark of a distinguished English writer that 'in the Roman Senate Octavius had a party, and Antony a party, but the Commonwealth had none.' Yet the Senate continued to meet in the Temple of Liberty and talk of the beauty and sacredness of the Commonwealth and gaze at the statues of the elder Brutus and of the Curtii and the Decii. And the people assembled in the forum, not, as in the days of Camillus and the Scipios, to cast their free votes for annual magistrates or pass upon the acts of the Senate, *but to receive from the hands of the leaders their share of the spoils.*"

Is not this an apt picture of what is now going on at our Temple of Liberty, where post-offices are handed over the counter at the rate of two hundred per day, to say nothing of the clerkships in railway-mail cars, for which the civil-service rules were suspended from March 15 to May 1? O shade of William Henry Harrison, how art thou vindicated as a prophet in the person of thy grandson!

It is true, as the Philadelphia *Telegraph* says, that the people who believe in civil-service reform have not "made Rome howl" over the shameful removal of Postmaster Pearson in order to make room for one of the Republican "Boys"; but we feel more and more persuaded that the indignation over this outrageous treatment of an old and faithful public servant by an Administration pledged to reform, is more general and deep than may appear on the surface. A gentleman who has long had practical knowledge of public affairs writes regarding it: "Had Mr. Pearson been in the army or the navy, and had he fallen wounded and bleeding upon the field in defence of his country, and, *because* he was wounded, had he been put to death by the orders of his own Government, the infamy of ingratitude could not have been more horribly expressed and illustrated than it has been by the Harrison-Wanamaker execution of the decree of the spoilsmen."

It is, by the way, most extraordinary that the public mind should ever have come to accept the curious distinction which exists between the attitude held as decent and essential in the case of an officer in the military or naval service and in the case of one in the civil service. Everybody takes it for granted that a man who enters the army or navy ought to be promoted and honored for efficient discharge of his duties, and any display of favoritism is resented as an outrage. But a man who enters the civil service, and devotes to it all his energies for many years, is not held to have any claim even to decent treatment in the matter of removal. The official guillotine does its cruel work in full sight of the public, and only a small class of thoughtful people seem to see anything repulsive in the spectacle. How did it ever come about that a nation which prides itself upon its common-sense view of looking at things got into this most preposterous attitude?

The *Sun*, which has apparently some sort of relations with the Tammany Democrats, protests against the Albany "deal" between Tammany and the Republicans on the—for the *Sun*—curiously good ground, that when Tammany has got the power, it ought to take also the undivided responsibility of the city government; and it points out that a deal of this sort led to the overthrow of the party under somewhat similar circumstances in 1868. This may be all true, but it is also true that Tammany will probably always find "a deal" with Republicans necessary as long as there are Republicans to deal with; and the reason is simple enough. An organization like Tammany, which lives by and for the distribution of offices as "spoils," is, and always must be, rent by internal dissensions, and must constantly throw off bodies of malcontents, called "Halls," or "County Democrats," or the like, owing to the impossibility of giving all the "workers" what they consider their due. This incessant and inevitable scission makes an occasional bargain of some sort with the Republicans for a division of the spoils absolutely necessary to the retention of power. Tammany would be ir-

resistible if it controlled the whole Democratic party, but it never does, and it is this fact which has called into existence the Republican Machine, and which makes the trade of a Republican "Boy" so profitable. So that Tammany might well reply to the philosophical remonstrances of the *Sun*, in the language of the editor of an indecent newspaper to somebody who offered to show him a more excellent way, "You are doing a noble work, but I have a family to support."

There is a very serious and even melancholy side to the affair, however, which is this: The Republican party in this city, it may be said without offence to anybody, contains a very large proportion of the intelligence and property of the community. It contains probably three-fourths of the voters who have a serious, permanent, and enlightened interest in the management of city affairs. To them these inevitable divisions of the Democrats give the balance of power at almost every election — that is, the power of forcing good candidates on one or other of the Democratic factions. This power, which might twenty-five years ago have begun to transform the city government in every department, and made New York, as a municipality, the glory instead of the shame of the continent, is, however, regularly, at every election, committed to a parcel of political adventurers, all unscrupulous and most of them needy, to trade with for their own gain and emolument, under the pretence or disguise of helping the party in the national arena. This, and not the wickedness or folly of Tammany, is to-day the most discouraging feature in New York city politics. Last year we had the same old game played over again, with the result that we see or are going to see. All the good Republicans, the business men, the clergymen, the editors, and the philanthropists, see the evil, and know well how it has worked in the past, but somehow cannot get past the open door. About election time they always have a feeling of "goneness" in their political stomachs, and think they must sneak in and take one drink more.

Unhappily, there is little ground for hope that Mayor Grant will be influenced much by the strong appeals which have been made to him to reappoint the present President of the Health Board, Mr. James C. Bayles. The men who have taken the trouble to make the appeals are the most competent authorities in the city to sit in judgment upon the value of Mr. Bayles's services. They are Dr. E. G. Janeway, Chairman, and Dr. R. H. Derby, Secretary, of the Committee appointed by the Academy of Medicine as an Advisory Board to consult with the Board of Health on questions touching the public health, and to keep watch generally over its doings. This Board was appointed soon after the appointment of Mr. Bayles, and at his request. It has had unusual facilities for observing the conduct of the Department, has improved these facilities to the utmost, and is decided in its opinion that President Bayles should be continued in his place, having received his appointment when bad management had reduced the usefulness of the Department, and having done so much to reorganize it. Mr. James Gallatin, who, as a member of the Tenement-House Commission appointed by Mayor Cooper, as Chairman of the Committee which secured the passage of the Plumbing Act of 1881, and in other capacities, has done a great deal towards the betterment of the sanitary condition of the city, is also anxious that no change shall be made in the head of the Board of Health. Mr. Gallatin has kept the closest watch over the Board under President Bayles's direction, and feels that it has done most thorough and systematic work, and that it would be unwise to make a change.

Now, under any rational system of responsible government, an official thus worthy and experienced would be continued in office without question. Mr. Bayles is undoubtedly one of the best officials that the city has had for years. When he was appointed by Mayor Hewitt, the selection was heartily praised in all quarters, for Mr. Bayles was then universally recognized as one of our highest expert authorities upon the subjects concerning which the Health Board has most to do. His career in office has demonstrated the immense value to the city of a thoroughly competent man in so important an office as the Health Board Presidency is. That is first of all a position requiring scientific knowledge, and nothing is more out of place in it than a mere politician such as Gen. Shaler, the predecessor of Mr. Bayles, was. It will be a great misfortune if Mayor Grant restores the old order of things, or if he makes any change whatever, for Mr. Bayles's experience in the office, added to his fitness, makes him by all odds the most desirable occupant of the place.

The City Reform Club has obtained at least a partial victory in one of its efforts to bring a liquor-dealing politician to justice. It has secured an order for the forfeiting of the $1,000 bail which was given in behalf of Strobel, a liquor-dealer who is one of John J. O'Brien's workers in the Eighth District, and whom the Club had indicted for perjury in swearing that his saloon was not open on election-day. In its recently published annual report, the Club gave a history of Strobel's case, in which it appeared that repeated efforts had been made to bring it to trial, but in each instance a postponement had been secured on the ground of the defendant's illness. The Club was informed that when the case was first reached early in January, the defendant was in Canada. After several adjournments, the case was set down peremptorily for the 27th February, the understanding being that if the defendant did not appear on that day, he should forfeit his bail. He did not appear, because, on the afternoon of the 26th of February, the Assistant District Attorney in charge of the case was relieved from duty in the court where the case was pending, and when the Club's representative inquired of him as to the disposition that had been made of the case, he was obliged to refer the inquirer to the District Attorney for further information. The District Attorney's explanation was that the case "was postponed, on motion of counsel for the defence, in order to secure the attendance of the defendant, it having been shown satisfactorily that Strobel was not in this city, but would return within a short period. On the return of the defendant, the case will again be called for trial." It was called again for trial last week, when the old motion for postponement was repeated, but Judge Gildersleeve refused to grant it, and ordered that the bail be forfeited. The perseverance of the Club was thus rewarded at last. The man who put up the bail was O'Brien's member of the Board of Aldermen, Goetz, who is also a liquor-dealer.

There is one profession which ought to have had a more prominent share in the present celebration than has been accorded to it, for none has made such advances since Washington's death, which it had a large share in hastening; we mean the medical profession. It is not now generally remembered, but it is literally true, that Washington was bled to death by his doctors. The first who was sent for found him, an old man of nearly seventy, suffering from cold and bronchitis, and, therefore, presumably weakened, or much "pulled down," as we now say. The doctor at once went to work and weakened him still further by taking from him eleven or twelve ounces of blood. Finding that the patient did not improve under this treatment, two others were called in, in consultation, and they at once proceeded to take from him between thirty and forty ounces more. As the loss of blood is the most exhausting process to which a man's frame can be exposed, the illustrious patient, naturally, sank under it rapidly, and in twenty-four hours from the beginning of his attack he was dead. He might have borne the loss with impunity had he been younger and in good health; but, being old and enfeebled by an acute disease, he went down under it.

The doctors were not to blame for this. They only did what their professional forerunners had been doing under similar circumstances for ages, and what Washington himself would probably have desired had he been caught without medical advice. But—we speak under correction in this—it is probably at least fifty years since any distinguished man has run any similar risk in the United States. In other words, within the past half century American, English, and French doctors have abandoned what for thousands of years they had treated as the sheet-anchor of their treatment, a remedy which they applied in nine out of ten cases that fell into their hands. A more striking illustration of the uncertainty of the medical art its revilers are not able to produce. It is true the doctors try to weaken the force of

the illustration by pleading that the characteristics of diseases have changed, that they are no longer of the inflammatory type as they used to be, or so much the result of plethora; but this does not make much impression. The practice is still kept up in those countries in which medical education has made least advances—Spain, for instance, and Italy. Within our own time, another great man of the Washington type, Count Cavour, has been slain by medical bleeding precisely as Washington was. The worse Cavour grew, the more his doctors bled him, and he finally succumbed under the treatment, in the flower of his age and in the midst of his usefulness.

Mr. David A. Gourick, a Washington attorney, has begun the publication of a monthly digest of the various decisions and opinions given in the offices and departments of the Government. This is a new and rich field, and it is to be hoped that it will be well worked. The number of persons in the executive branch of the Government who make decisions nowadays is astonishingly large. So great is the Federal business, and so immense is the corps of Government officials at this time, that we must not only have solicitors detailed to each department by the Attorney-General, but several law officers in almost every bureau. The newspapers tell of decisions of the comptrollers, the opinions of the Solicitor of Claims in the Department of State, the rulings of the Commissioners of Patents, of Pensions, of Customs, of Internal Revenue, of the Land Office, and many others, but there has been no one journal to give them all. These decisions and adjudications frequently affect large classes of persons, and are often of far-reaching importance, but the public is generally entirely ignorant of their promulgation. It is very much to be desired that some journal should not only record them, but fearlessly comment upon them as they appear. Nothing is more needed than a little light cast upon the workings of our departments, and strong, healthful criticism of their methods. A chief of a bureau or of a division who should have the temerity to disclose the defects of the methods in vogue, the absurdities of the rules of practice which have been adopted, and the circumlocutions—that heritage of the spoils era—by which public business is so unnecessarily impeded, would be more than a nine days' wonder among his fellows. During the days of President Grant, the departments were affected by militarism. The idea took root and spread in all directions that criticism meant mutiny. Strict discipline required not only obedience to superiors, but reverence for the red tape in which they wound themselves. So it has come to pass that arbitrary orders are issued, unjust decisions are rendered, imbecile opinions are given, and absurd practices recommended, and there is no one to report the matter truly.

The *Iowa State Register* says that there are fewer convicts in the Iowa penitentiaries today than there were three years ago, notwithstanding the increase in the population of the State. So large has been the decrease at Fort Madison, where the contract work is carried on, that more than two thirds of the State has to contribute to that prison in order to get enough men to do the work. Warden Crossley says that there has been a decrease of 25 per cent. in the number of prison inmates during the last three years. As there has been no appreciable difference in the vigilance of officers or the ratio of convictions to indictments, the manifest inference is that there are not so many crimes being committed in the State of Iowa as there were three years ago, and the *Register* attributes the change to the closing of the saloons through the prohibitory law. At the same time there are cities like Keokuk where, as a square test, a majority votes against enforcing the prohibition law. Evidently, then, a State law does not close the saloons everywhere. The moral of Iowa's experience, with no open saloons in four-fifths of the counties and open violation of the law in the other fifth, would seem to be that the true method of solving the liquor problem is through a local-option and high-license system, as Massachusetts decided last week.

The condition of the iron industry in this country and in England respectively has engaged the attention of *Iron*, one of the organs of the trade, published in Philadelphia. It appears that the condition of the trade abroad is highly satisfactory and that it extends to nearly all branches, from pig-iron up to steamships. The demand for pig has advanced the price in Glasgow 1s. 6d., and in the Cleveland district 2s. per ton. "Great activity prevails in the steel trade," says *Iron;* "in steel rails business is exceptionally active and brisk, and not only are makers fully employed, but they are in receipt of inquiries which will maintain the position throughout the year." The same is true in substance of blooms, ship-plates, and boiler-plates. Shipbuilding on the Clyde, the Tyne, and the Wear is brisk. Moreover, says *Iron*, "in the heavier forms of iron and steel prices are in many instances higher than at any time in 1888, *and above the prices that are in force in this country.*" Reviewing the home market, *Iron* says: "The improvement in the foreign iron trade has not in any way as yet affected the market here." Well, how should it? We have shut ourselves up by a high tariff. We have put a duty on iron ore to prevent ourselves from getting necessary raw materials at low rates. We have tariffed ourselves wherever possible, so that we have no foreign markets except for articles like locomotives and sewing-machines and some kinds of hardware in which we have a superiority of the inventive faculty. Consequently, when a new demand springs up in the world at large, we cannot share in the supplying of it. We are restricted to our own little market of sixty millions of people, while England has all the rest of the world for buyers of her goods.

Mr. Bates has hastened to justify our criticism of his appointment as a member of the Samoan Conference. The cable reports that on Saturday he explained to Prince Bismarck "that his article on Samoa in *The Century* magazine was written long before he was nominated a delegate to the Conference, and that after his nomination he tried to withdraw the article, but in vain, as thousands of copies had been printed." But what has this to do with Mr. Bates's acceptance of the position for which he found that he had thus unfitted himself? If he could not "withdraw the article," at least he could withdraw himself. And, if the article were sound, why should he be willing to withdraw it—in other words, how were its character and usefulness destroyed by the appointment of the writer of it to a little office? Prince Bismarck evidently was alive to the humor of all this, for we read that "the Chancellor was especially cordial to Mr. Bates." No doubt a man of the world would be "cordial" to anybody who provided him with such exquisite fun. But better yet remains:

> "Mr. Bates has explained to Count Herbert Bismarck that since the publication of the official despatches in the White Book, which showed the attitude of the German Government, his article in the *Century*, which he had written as a private and uninformed person, had lost all point. He said that he had the utmost esteem for Germany, to which country America owed much. Nothing was further from his thoughts than to wound either the German nation or the German Government. Mr. Bates said he desired that this statement be published, and he trusted that it would remove entirely any ill-feeling towards him."

What our representative wrote as an "uninformed person" has "lost all point" by publication of the facts in the case which he wrote about. But the "point" was that Mr. Bates was "uninformed." To prove that he was so he thinks clears him of blame. It is a strange contention that you may say what you like, provided that you don't know what you are talking about.

If the arrival of Boulanger in England, and his riding his black horse in Rotten Row, amid the applause of the bystanders, increases his popularity in France, it will greatly increase the pity of the intelligent portion of other communities for the French people. Wherever he goes he acts as a sort of proclamation of the imbecility and failure of the Government of his own country based on universal suffrage. He is not, like other French pretenders who have sought shelter in Belgium or England, the representative of a rival dynasty, or a Republican protesting against Cæsarism or royalty. He is a soldier expelled from the army for insubordination, who has made his fame by announcing that the representatives of the French people, assembled in a Republican Parliament, are a parcel of knaves and fools. That any considerable number of Frenchmen should follow the movement of such a preacher in foreign countries, with hope or sympathy or admiration, or with any feeling but shame and indignation, is surely a most unpromising symptom. It will make a great many foreign observers feel as if real national pride was dying out in France.

A CENTURY OF DEMOCRACY.

"It has been frequently remarked," said Madison, in the first number of the 'Federalist,' opening that masterly series of essays upon the Constitution then pending, "that it seems to have been reserved to the people of this country, by their conduct and example, to decide the important question whether societies of men are really capable or not of establishing good government from reflection and choice, or whether they are for ever destined to depend for their political constitutions on accident and force. If there be any truth in the remark," he continued, "the crisis at which we are arrived may with propriety be regarded as the era in which that decision is to be made; and a wrong election of the part we shall act may, in this view, deserve to be considered as the general misfortune of mankind."

This language was not too strong for the situation. It would, indeed, have been "the general misfortune of mankind" if the American Union had not been established. But it would be a vastly greater misfortune if the experiment of Democracy thus inaugurated were, after thorough trial, to prove a failure. If the United States never had existed, the world might still look forward to the realization of the grand conceptions which brought this nation into existence; but if the American Union shall ever fall into decay, the human race may well despair of its capacity for progress.

The completion of a century since the inauguration of the first President is an occasion for serious reflection on the tendencies of the times. The material progress which the hundred years have brought may be left out of the account in such an estimate, for it has no real bearing upon the underlying question. It is interesting to note the changes that have attended the development of the railroad and the telegraph, and to contrast the meagre resources of the few States along the Atlantic seaboard in 1789 with the vast wealth of the great nation of 1889; but it is not important. Nor need we stop to consider the fact that the delicate system of interdependent Federal and State governments has been found, after the most crucial test, to work successfully, and that the perpetuity of the Union, so far as this feature is concerned, seems assured. That is one of the greatest achievements in human history, but it is not the fundamental element in the problem. The vital question concerns the national character, for character is the supreme test of a nation, as of a man. Does a century of Democracy leave the American people possessed of more robust virtues, putting more of conscience into the work of self-government, than it found them?

Contrasts between different periods in a nation's history centre about the prominent individualities of those periods. Such a contrast on this occasion is certainly calculated to depress one. The celebration in the midst of which we write, occurs in the metropolis of the country, whose Mayor is Hugh J. Grant, and in the greatest State of the Union, whose Governor is David B. Hill; while the latest successor of George Washington is Benjamin Harrison. These three men represent theoretically the consummate flower of the national century-plant; presumably they are the three men whom the voters of city, State, and country have picked out as their first citizens.

Obviously the scheme for securing the best men within the range of choice to fill the highest offices has failed. The framers of the Constitution flattered themselves most of all upon the elaborate contrivance which they had devised for the choice of President. "The process of election," said Hamilton in the 'Federalist,' "affords a moral certainty that the office of President will never fall to the lot of any man who is not in an eminent degree endowed with the requisite qualifications. Talents for low intrigue, and the little arts of popularity, may alone suffice to elevate a man to the first honors in a single State, but it will require other talents, and a different kind of merit, to establish him in the esteem and confidence of the whole Union, or of so considerable a portion of it as would be necessary to make him a successful candidate for the distinguished office of President of the United States. It will not be too strong to say that there will be a constant probability of seeing the station filled by characters preëminent for ability and virtue." In so far as regards the impossibility of a man's capturing the highest office by talents for intrigue, the expectation has been verified thus far—we have never had a "Dave" Hill in the White House; but some of its occupants have made the expression about "characters preëminent for ability" sound like a sarcasm.

The attempt to secure a succession of ideal Presidents through a system of electoral colleges, composed of the best citizens of all the States and acting independently, was predestined to failure; but the substitute of really naming the chief executive in one or other of two great party conventions, composed of hundreds of men, surrounded by thousands of spectators, and often swept away by some sudden wave of excitement, has been an even worse failure. The mob may thus name the President. As Mr. Blaine says in his 'Twenty Years of Congress': "In a final analysis of the causes and forces which nominated Mr. Lincoln, great weight must be given to the influence which came from the place where the Convention was held, and from the sympathy and pressure of the surrounding crowd. Illinois Republicans, from Cairo to the Wisconsin line, were present in uncounted thousands. The power of the mob in controlling public opinion is unmeasurable. In monarchical governments it has dethroned kings, and in republics it dictates candidates."

The evil runs through the whole system, and renders possible the nomination, which in turn renders possible and often inevitable the election, of such men as Hill to positions which rank well up towards the Presidency in power. Here "talents for low intrigue" find ample scope, and their employment may even decide the Presidency itself. Everybody of sense knows that Hill was elected Governor last fall through the saloon vote, and that the same saloon vote was cast for Harrison, giving him New York State, and thus electing him.

Nearly fifty years ago, when this evil had not fully developed, Story wrote in his 'Exposition of the Constitution': "The President is in no just sense the unbiassed choice of the people, or of the States. He is commonly the representative of a party, and not of the Union; and the danger, therefore, is that the office may hereafter be filled by those who will gratify the private resentments, or prejudices, or selfish objects of their particular partisans, rather than by those who will study to fulfil the high destiny contemplated by the Constitution, and be the impartial patrons, supporters, and friends of the great interests of the whole country." So true is it that the President has come to be the representative of a party, and not of the Union, that Gen. Grant once used the expression "the party which I represent," without any apparent comprehension that there was the slightest impropriety in such an attitude; while his successor was roundly ridiculed for the suggestion that "he serves his party best who serves his country best."

Experience has more than justified Washington's insistence in his "Farewell Address" upon "the baneful effects of the spirit of party." He urged that "the common and continual mischiefs of the spirit of party are sufficient to make it the interest and duty of a wise people to discourage and restrain it"; and yet in his day parties had hardly come into existence. The development of the spoils system is due to party spirit, and it is party spirit which renders it so hard to overthrow that system. Such a system was never even contemplated as within the range of possibilities by the fathers. Read what Washington wrote to a friend regarding the subject of appointments a few days after his inauguration:

> "No part of my duty will be more delicate, and in many instances more unpleasing, than that of nominating or appointing persons to office. It will undoubtedly often happen that there will be several candidates for the same office, whose pretensions, ability, and integrity may be nearly equal, and who will come forward so equally supported in every respect as almost to require the aid of supernatural intuition to fix upon the right. I shall, however, in all events, have the satisfaction to reflect that I entered upon my Administration unconfined by a single engagement, uninfluenced by any ties of blood or friendship, and with the best intentions and fullest determination to nominate to office those persons only who, upon every consideration, were the most deserving, and who would probably execute their several functions to the interest and credit of the American Union, if such characters could be found by my exploring every avenue of information respecting their merits and pretensions that it was in my power to obtain."

Contrast this statement with the recent extraordinary revelation that the Republican Congressmen from Missouri had met as a board of patronage to divide the spoils in that State, in accordance with the President's own suggestion. Contrast, also, the confession that efficient men are discharged from office simply for political reasons, with Madison's declaration that one such removal would constitute good cause for impeachment. During the first Congress the question arose whether the President could remove an official without the consent of the

Senate. Madison held that such power was essential to efficient administration, and laughed at the suggestion that it would ever be abused. He said:

"The danger then, consists merely in this: the President can displace from office a man whose merits require that he should be continued in it. What will be the motives which the President can feel for such abuse of his power, and the restraints that operate to prevent it? In the first place, he will be impeachable by this House, before the Senate, for such an act of maladministration; *for I contend that the wanton removal of meritorious officers would subject him to impeachment and removal from his own high trust.* . . . Can we suppose a President, elected for four years only, dependent upon the popular voice, impeachable by the Legislature, little, if at all, distinguished for wealth, personal talents, or influence from the head of the Department himself—I say, will he bid defiance to all these considerations, and wantonly dismiss a meritorious and virtuous officer? *Such abuse of power exceeds my conception.*"

Nowadays such abuse of power is the most common thing in the world, and the worst feature of the case is that hardly anybody criticises it. Madison could not conceive that a President would ever be guilty of this offence, but he believed that, if such an event ever should occur, the offender would be promptly impeached. Now it is taken as a matter of course, and the person who objects is denounced as a "holier-than-thou."

The growing power of wealth and the growing worship of wealth must challenge the attention and arouse the apprehension of every thoughtful observer. Rich men now invest in offices as they do in horses or yachts, and millionaires are elected (because they are millionaires) who are so destitute of ability or merit that they would never be suggested except for their wealth. These abuses are not condemned by the press generally, because the press itself is afflicted with the craze for wealth. The conception of the editor as a public teacher, which Horace Greeley preached and exemplified, has yielded to the idea that a man may run a newspaper just as he would a cotton-mill, simply to make the largest possible dividends, and with no sense of duty towards the public. Worst of all, editors are becoming the most pertinacious of office-seekers, and many of the most prominent newspapers in the land are now muzzled through the appointment of their editors.

These are somewhat gloomy reflections—quite out of keeping with the roseate pictures of progress which the orators of the week have had to draw. But nations have fallen in the past because people were not content to accept such warnings as are contained in the impressive words with which Judge Story concluded his analysis of the Constitution in 1840:

"Let the American youth never forget that they possess a noble inheritance, bought by the toils and sufferings and blood of their ancestors, and capable, if wisely improved and faithfully guarded, of transmitting to their latest posterity all the substantial blessings of life, the peaceful enjoyment of liberty, of property, of religion, and of independence. The structure has been erected by architects of consummate skill and fidelity; its foundations are solid; its compartments are beautiful, as well as useful; its arrangements are full of wisdom and order; and its defences are impregnable from without. It has been reared for immortality, if the work of man may justly aspire to such a title. It may, nevertheless, perish in an hour, by the folly or corruption or negligence of its only keepers, THE PEOPLE. Republics are created by the virtue, public spirit, and intelligence of the citizens. They fall when the wise are banished from the public councils because they dare to be honest, and the profligate are rewarded because they flatter the people in order to betray them."

Happily, there is encouragement to be derived from the nation's triumph over threatening difficulties in the past. Nothing in the present situation is so depressing as was the outlook half a century ago, when the slave power dominated the land. Yet, even in such a gloomy epoch, that profound philosopher, Ralph Waldo Emerson, in his address on "Man the Reformer," delivered in 1841, uttered this hopeful forecast: "We complain that the politics of masses of the people are controlled by designing men, and led in opposition to manifest justice and the common weal, and to their own interest. But the people do not wish to be represented or ruled by the ignorant and base. They only vote for these because they were asked with the voice and semblance of kindness. They will not vote for them long. They inevitably prefer wit and probity." So, too, three years later, in his address on "The Young American," he said: "We cannot look on the freedom of this country, in connection with its youth, without a presentiment that here shall laws and institutions exist on some scale of proportion to the majesty of nature. To men legislating for the area betwixt the two oceans, betwixt the snows and the tropics, somewhat of the gravity of nature will infuse itself into the code." In like hopeful spirit spoke James Russell Lowell, when he said, in concluding his address on the assassination of Garfield in 1881: "I am not one of those who believe that democracy any more than any other form of government will go of itself. I am not a believer in perpetual motion in politics any more than in mechanics, but, in common with all of you, I have an imperturbable faith in the honesty, the intelligence, and the good sense of the American people and in the destiny of the American Republic." Perhaps more significant and encouraging is the more recent conclusion of another philosophical observer, whose judgment is not affected by any partiality of patriotism, Mr. James Bryce, who, in the introduction to his masterly discussion of 'The American Commonwealth,' notes "the existence in the American people of a reserve of force and patriotism more than sufficient to sweep away all the evils which are now tolerated, and to make the politics of the country worthy of its material grandeur, and of the private virtues of its inhabitants. America excites an admiration which must be felt upon the spot to be understood. The hopefulness of her people communicates itself to one who moves among them, and makes him perceive that the graver faults of politics may be far less dangerous there than they would be in Europe. A hundred times in writing the book have I been disheartened by the facts I was stating; a hundred times has the recollection of the abounding strength and vitality of the nation chased away these tremors."

"All forms of human government," said Machiavelli, "have, like men, their natural term, and those only are long-lived which possess in themselves the power of returning to the principles on which they were originally founded." The real question of to-day is whether the American people possess this power of returning to the principles which governed in 1789. We are bound to believe that this latent power still exists—if for no other reason, because the contrary conclusion would make all mankind despair of the world's future.

A STUDY IN MODERN GOVERNMENT.

ABOUT a month ago, after several weeks of more or less thoughtful discussion in the newspapers and elsewhere, there was presented to the Legislature at Albany a bill which embodied a plan for securing a comprehensive system of rapid transit for New York city. The measure had been drawn by the city's legal adviser, the Corporation Counsel, and was known to embody the views of the city's chief Executive. It was published in full in the newspapers, and its various provisions were closely examined and seriously discussed. It was introduced simultaneously in both branches of the Legislature, and its advocates made strenuous efforts to have it advanced as fast as possible. For several weeks the discussions upon this bill and the prospects for its final passage have occupied more space in the newspaper reports from Albany than any other topic of legislative interest. More leading articles have been devoted to it, and to the elements opposing and favoring it, than to any other one subject of public discussion.

It was declared early in what may be called the bill's "campaign," that Jay Gould was making the most insidious and unscrupulous efforts to defeat it. Whenever its advance in either body was checked, there would be an outcry that Jay Gould's grip was upon the Legislature. On one day the bill would go with unexpected ease through a committee, and hope of its triumphant passage through the Legislature would be high; but on the next day it would receive a setback in one house or the other, and again would be heard the uproar about Jay Gould's devilish proceedings. About a fortnight ago the bill suddenly became hopelessly blocked in the Senate, and though the Jay Gould bogey was "worked" as industriously as ever, it soon became known to everybody who was able to see behind the scenes at all, that the hand that was blocking the bill's progress was "Tom" Platt's. There was a tussle, lasting for several days, between the Lieutenant-Governor, who was supposed to be doing Gov. Hill's bidding in the chair, and the Republican majority on the floor, to see whether Platt's grip was strong enough to resist all efforts to loosen it. The conclusion apparently reached was that conciliatory methods would be absolutely necessary, for on Saturday week Gov. Hill suddenly left Albany for New York city, and the Lieutenant-Governor ceased to attempt to control the Senate by overruling the majority in spite of all parliamentary rules and usages.

On arriving in New York the Governor, with considerable ostentation, conferred with

some of the members of the Committee of Centennial Arrangements, and it was announced that this was the object of his visit. Afterwards he went into executive session with the Mayor and Richard Croker; and so loyal a friend of the Governor's as the *Sun* gave currency to a rumor that "Tom" Platt took some part or other in the conference, his views being there if he himself was not. On Monday, a bill which had been slumbering unnoticed in both houses since March 14, received a sudden impetus. It provides for a reconstruction of the Police Board in New York city, reducing the number of members from four to two, and requiring that one shall be a Democrat and the other a Republican. Under the present law, the Mayor can appoint all the members from one party if he chooses. There is to be a vacancy in the Board on May 1, owing to the fact that on that date the term of a Republican member, "Steve" French, is to expire. It has been an open secret that the Mayor has not wished to reappoint French, or to name any other Republican, but to put a Tammany man in the place. This bill, making it obligatory upon him to appoint a Republican, was taken up suddenly in both houses on the reassembling of the Legislature after the Governor's visit to this city, and its final passage, as well as that of the Rapid-Transit Bill, is now said to be certain. It has already passed the Senate.

The *World*, which is the organ both of the Governor and the Mayor, makes the announcement that "there is urgent need for reformation in the Police Department in this city." In the *Sun*, which is a more devoted Hill organ even than the *World*, we find this information:

> "The Albany situation is full of interest to local politicians. The two-headed non-partisan bills have slept so long in the Legislature that the activity now shown in pushing them is regarded as significant. The purpose of the Republicans to make use of the Democratic interest in Mayor Grant's Rapid-Transit Bill in getting them through and signed by the Governor is apparent. There is one thing certain, and that is that the Tammany people are feeling very comfortable over the Albany situation. They seem to think that the Mayor's Rapid-Transit Bill is coming out all right, and the prospect of the Police Commission being made two-headed, or the making of the Bureau of Elections a separate department with two Commissioners, does not disturb them."

Similar information appears in the *Times* and *Tribune*. The *Times*, which has had great faith in the Mayor's disinterested motives on the rapid-transit question, has very full and minute intelligence about the agreement or "deal," and says that Mr. Platt's associate in the negotiations in behalf of the Republicans was Mr. Van Cott, our new Postmaster, who is too busy with politics to assume his new duties.

Now, it is not our purpose to moralize on this "deal," but simply to call attention to it as an illustration of what government in the State of New York has come to be in this year of centennial jubilation. Here the newspapers have been discussing for a month or more a question of the greatest importance to this city. Some of them, at least, have been discussing it seriously, with no other desire than to have that result reached which should be most beneficial to the city's interests. Of what possible use has the discussion been? Has the Legislature listened to it at all? Have the members been influenced in the slightest degree by either that or by the arguments made in committee? Certainly not. The fate of the measure has from the beginning hung upon the will of two men, or possibly three —Gov. Hill, "Tom" Platt, and "Dick" Croker. These three get together and decide what shall become of it. Platt's terms are not known, of course, beyond that portion of them which is revealed by the Police Commission Bill. That bill will make a place for one Boy, and very likely will result in keeping O'Brien or another Boy in charge of the Bureau of Elections. Nobody will know till the Rapid Transit Commission is appointed whether Platt's terms include a share in that or not. Undoubtedly also the Governor has his terms, and what is left after he and Platt have received their share will go to Croker for Tammany Hall.

Could there be a greater farce than this under the name of legislation? Why put the State to the expense of keeping a body of 160 men in session at Albany for five or six months in order to have it do what three men agree upon at a "conference" of a few hours' duration? Why not make Gov. Hill, "Tom" Platt," and "Dick" Croker a commission of three to govern the city and State, and pay them for the service? That would be only formal recognition of what is really the government of New York to-day.

IN AND OUT OF OKLAHOMA.

Oklahoma will be known in history as the Territory that was settled in one day and very nearly unsettled again two days later. On Tuesday, April 23, something like 50,000 people, some of whom had been camping on the borders of the promised land for two years, made a wild rush into it and seized upon its soil. Ten or fifteen thousand of them squatted on one spot, called it the city of Guthrie, endeavored to establish a municipal government, opened a bank with a capital of $50,000, issued a newspaper—all between twelve o'clock noon and four P. M. They mapped out the city into squares, opened and named streets, and sold all the house lots, the corner lots bringing fine prices. At night they went to bed, some in tents, some on the ground. Oklahoma City was established in another part of the Territory in a similar way, and smaller towns were established and named under much the same circumstances. When night came at the end of the first day, it was estimated that every particle of desirable land among the 1,800,000 acres comprising the new Territory had a claimant. The country was settled. No less than three cities had been builded, not merely in a day, but in an hour, and there were more towns than can now be enumerated. It was said, with much eloquence, by a Chicago reporter who was there, that "Guthrie, which was at noon a name on the map, a little red station-house by the railway, was at nightfall a booming city of 15,000 inhabitants."

But daylight of the following day, coming after a night which had made painfully evident the fact that the changes of temperature from heat to cold were very sudden in the promised land, made many other depressing revelations. It was noticed that the soil was rich enough in the main streets of the city of Guthrie, but that the surrounding country was sterile, capable of bearing nothing more than buffalo grass and cactus. It was discovered that the water in the one neighboring stream was not abundant; that the stream itself was small, and that the water had an alkaline flavor. It began to be suspected that there never could be a great city in such a spot, and that somebody had been working up the price of town lots for selfish purposes. The second night came after a day of much suffering in body as well as in mind. There was scarcity of both provisions and water, as well as shelter. In the night a violent wind arose, filling the air with stifling alkali dust, and bringing in its train a pouring storm of rain. The next morning nothing except the lack of adequate transportation facilities saved the proud city of Guthrie, with its bank and newspaper, from instant depopulation. Everybody who could get upon a railroad train, either inside or outside the cars, got there, and started out of the promised land. Even the eloquent Chicago reporter lost heart and sent off this mournful tale: "Guthrie is without form. The original streets have disappeared, and new sections are being ploughed every hour. Values have fallen to practically nothing, and public confidence is at a low ebb."

The story of Guthrie is the story, with slight variations, of the other parts of the new land. The rush to get out became on the second day as violent and frenzied as it had been to get in, and it is continuing daily. It is now estimated that not more than one-quarter of those who went in will remain.

Was there ever a more extraordinary exhibition of the restlessness of the American character than this Oklahoma episode has furnished? For ten years a constantly increasing throng of persons, until they numbered 50,000, has been struggling to get into Oklahoma. Probably not one in a hundred of them knew why he wished to get in. All he knew was that he was not allowed to go, and he reasoned that the land must be an extraordinarily attractive and desirable one because he was kept out of it. There never was a more successful boom in politics than this of Oklahoma. It was started, as many a political boom has been, by the judicious use of money. There is little doubt that the first boomers were paid by the railway companies to break into the Territory and endeavor to establish settlements. Every time that they broke in and were driven out again, the knowledge of their exploits spread over a wider area and reached the ears of more people. Why were they trying to get in, and why were they so often baffled? That they were ejected because the land was reserved by the Government for the Indians, did not sufficiently explain the proceedings. There must be something wonderful in the country itself which caused such unusual struggles.

Without reasoning further than this, the

unsettled and roving dispositions of the whole country began to gather on the border and peer into the forbidden land. Every fresh raid had a larger number of participants, and the increased difficulty of ejecting them sent a louder rumor abroad. It even reached other countries, and recruits for the boomers began to come from Germany, England, and even Russia. Finally the politicians had to take a hand, and a law was passed decreeing that a portion of the coveted domain should be thrown open for settlement, and a date was fixed by Presidential proclamation when legal possession could be taken. The Boomer "cities" stretching along the border swelled into marvellous proportions after this was known, and on the date of entry they contained in the morning their thousands of souls, and at night not one. They were all deserted and their inhabitants had founded new cities.

Two days later they were reinhabited for a few minutes by the same boomers getting back as fast as possible to a base of supplies. They had gone into the promised land evidently expecting to find it literally flowing with milk and honey. They seem to have taken no thought as to what they were to subsist upon, how they were to be sheltered and clothed. They had rushed into a wilderness without stopping to think how they were to live when they got there. To reach the wilderness they had crossed over millions of acres of as good if not better land than they were to find there, which they could have had for a fraction of what they had spent to reach the wilderness, and upon which they could have established homes with the benefits of civilization within their reach, and the protection of organized State governments about them. But they paid no attention to that. They left all behind and rushed forward, to meet nothing but desert privation, hunger, thirst, and mob lawlessness. The only ones among the boomers who have profited by the expedition are the cool-headed scoundrels who went into it and kindled its excitement to fury for the gain which they could make out of it. Many of them are probably on the way out now with the money of their victims in their pockets.

THE MUSICAL DEPARTMENT OF THE NEWBERRY LIBRARY.

CHICAGO, April 14, 1889.

THE fundamental purpose of the late Walter L. Newberry, in his munificent bequest for the endowment of a library in Chicago, the nucleus of which has been already organized, was to make it an exhaustive reference library for the use of scholars and the general literary public. The trustees, Mr. W. H. Bradley and Mr. E. W. Blatchford, and the accomplished librarian, W. F. Poole, late President of the American Library Association, have kept this purpose steadily in view, and, in organizing and enriching its various departments, beginning with that of bibliography, which is becoming one of the most complete in the country, have aimed to make the collections in each notable for their original search documents, manuscripts, maps, charts, and books. In this important work, assisted by well-known experts, and having the advantage of the services of experienced connoisseurs and antiquarians, they have been remarkably successful, to the extent even that the library, though it will be in a formative condition for many years, has already acquired an international reputation.

The musical department of the library has made rapid progress, and, though yet but the nucleus of what it will be ere long, it can safely challenge any other collection of its kind in this country in its complete adaptation to the needs of musical scholarship, and in the number of rare works and original editions which it contains. The preparation of the list of books occupied several months of careful research, and it was then scrutinized by musical experts, both here and in the East, among them Prof. Paine of Harvard, who asked permission to borrow titles from it for the use of the University collection. It was then sent to Europe, and for nearly a year experienced buyers have been engaged in filling the orders. In the pursuit of some of the rarest volumes, the trustees were notified of an opportunity to purchase the library of Count Pio Resse of Florence, Italy, which contained among its other valuable books many unique musical works covering the most important period of Italian musical history. One score alone, the opera of "Euridice," by Peri, to which reference is made below, induced the trustees not only to take the whole collection, but to close the bargain by cable, lest this treasure should be lost to the library. When the books arrived, they were found to be even more valuable than the catalogue indicated, large numbers of them being original editions of the most famous writers of the sixteenth and seventeenth centuries.

In scores the library is already very complete. It possesses the orchestral scores of nearly all the important Italian, French, German, and English operas (both the orchestral and piano scores of the Wagner music-dramas), of all the standard symphonies, and of the leading works of Berlioz, Liszt, Rubinstein, Dvořák, and other composers of the modern Romantic school; numerous editions of piano and organ music; the songs and ballads of various countries; the early music of the Roman Catholic and Anglican churches, the German chorales, and English and American psalmody; while a large collection of oratorios, cantatas, and chamber music is on the way, all of which is properly supplemented by a complete list of thematic catalogues.

A glance at some of the special editions among these scores will indicate both their excellence and completeness. They include the 34 volumes of the Bach Gesellschaft; the 48 volumes of Beethoven issued by Breitkopf & Härtel; the 16 volumes issued by the English Händel Society, and the 94 sumptuous volumes of the German Händel Society; the 73-volume Breitkopf & Härtel edition of Mozart, the 40-volume edition of Mendelssohn, the 29-volume edition of Palestrina, the 21-volume edition of Schubert, the 7-volume edition of Heinrich Schütz, and the 38-volume edition of Schumann, all by the same house. The 19 volumes published by the English Musical Antiquarian Society are particularly rich in early English music, including madrigals, motetts, songs, and fantasies by quaint old John Evelyn, Bateson, Bennett, Byrd, Orlando Gibbons, Hilton, Morley, Weelkes, and Wilbye (1589-1627); the songs of John Dowland, Shakspere's friend, whose "Lacrymæ" has been preserved for posterity in the plays of Ben Jonson, Middleton, Fletcher, and Massinger; the "Parthenia," the first music composed for the virginals; and Purcell's dramatic music to "Bonduca," "King Arthur," and "Dido and Æneas," this last being the first serious effort of the father of the English lyric drama. The "Musica Antiqua," a comprehensive selection of the motetts, madrigals, anthems, lessons, and dance tunes from the twelfth to the eighteenth centuries, arranged by John Stafford Smith, organist to George III., is a fitting companion to these volumes. In the same general line is the 'Publikation Älterer Praktischer und Theoretischer Musikwerke vorzugsweise des XV. und XVI. Jahrhunderts,' published under the auspices of the German Gesellschaft für Musikforschung at Berlin. Four elegant volumes, 'La Harpe d'Éole,' 'Les Sirènes,' 'La Danse Macabre,' and 'Les Cris de Paris,' by that indefatigable composer and littérateur, Georges Kastner, who died in Paris in 1867, are monuments to his industry, as they join to exhaustive and richly illustrated essays on these subjects elaborate musical settings of the same subjects in symphonic form for voices and instruments. Another extremely valuable work is the beautiful four-volume edition of Benedetto Marcello's 'Settings of the Psalms,' bound in vellum and issued in Venice in 1803, besides which the library also has the Milan five-volume edition of the same with Mirecke's piano accompaniments, revised by Cherubini. A rare novelty is the 'Sacred Songs of Francesco Soto,' published at Rome in 1588. Soto was the friend of St. Philip Neri, the father of the oratorio, and in 1575 had charge of the music in the oratory which the latter founded. Soto was also the founder of the first Carmelite convent in Rome, and a special favorite with Sixtus V., of whose chapel he was dean at the time of his death. Among the older Italian works are a set of canzonets and madrigals by Brunelli, chapelmaster to the Duke of Tuscany, Venice, 1614; canzonets by Cazzati, chapelmaster of San Petronio in Bologna, 1668; the sacred motetts of Cifra, a pupil of Palestrina, of whose music Milton was very fond, Rome, 1638; canzonets of Giovanni Battista of Gagliano, Venice, 1623; concerted pieces with organ by Vincenzo Pellegrini, Venice, 1619; and the madrigals of the Bolognese chapelmaster, Alessandro Spontone, Venice, 1585. There is also in the Italian collection a set of manuscript songs for alto with accompanying bass, beautifully written and adorned with exquisite initial capitals, which is claimed to have been the handiwork of Stradella. Its authenticity, however, has not yet been established. As an artistic work it is none the less unique.

The gem of the collection is the original edition of Jacopo Peri's opera, "Euridice," Florence, 1600, an edition which has now become so rare that only one other copy is supposed to be in existence. Its value is derived from the fact that it was the first opera which was ever publicly represented in the world. In 1597 Peri wrote the opera of "Dafne," set to a poem by Rinuccini, and the music composed in what was supposed to be the style of the ancient Greek tragedy. It was only privately performed, however, at the Palazzo Corsi; but its success was so great among the friends of Peri that he was induced to compose music in the same style to the poem of "Euridice," also written by Rinuccini, which was publicly performed upon the occasion of the festivities attending the marriage of Henry IV. of France to Maria de' Medici. In his exhaustive sketch of the rise and progress of "Opera" in Grove's Dictionary, Mr. Rockstro, speaking of the original edition, not only says that he has never seen a copy of it himself, but adds: "This score is now exceedingly scarce. Hawkins did not even know of its existence, and Burney succeeded in discovering one example only, in the possession of the Marchese Ri-

nuccini, a descendant of the poet at Florence; but a copy of the Venice edition is happily preserved in the library of the British Museum." The copy acquired by the Newberry Library is the Florence original edition (1600); that in the British Museum is the Venice reprint of 1608. It is bound in vellum and is perfectly preserved. The notation is in the old lozenge-shaped notes, the recitative being accompanied by the ordinary figured bass. A copy of the original libretto also came with it, bearing the same date and containing a dedication by Rinuccini to the Queen. Though considerably stained when received, it has been skilfully restored and is now in perfect condition. Query for the bibliographists: Is this copy the one which Burney saw, and is it not the only copy in existence?

The student of the science of music will not only find in this library the standard modern works, such as those of Ouseley, Lobe, Marx, Richter, Helmholtz, Judassohn, Hauptmann, Cherubini, Berlioz, and others, but he can fairly revel in original editions of unique works. Meibomius is represented by a fine copy of his great work, 'Antiquæ Musicæ Auctores Septem Græce et Latine,' 2 vols. (Amsterdam, Elzevir, 1652). There are also beautiful copies of Padre Martini's 'Storia della Musica,' dedicated to Maria Barbara, Queen of Spain (1757), and of his 'Esemplare di Contrapunto,' two works whose sumptuousness of print and pictorial embellishment put to shame the moderns. There are also the original editions of the three greatest treatises of the most learned theorist of his time, Gioseffe Zarlino, viz.: 'Dimostrationi Armoniche' (Venice, 1571); 'Le Istitutioni Armoniche' (Venice, 1558); and 'Sopplimenti Musicali' (1538). Of equal rarity are the splendid originals of the old Jesuit, Athanasius Kircher—the 'Musurgia Universalis' (Rome, 1650); the 'Phonurgia Nova' (Rome, 1673), an amplification of the 'Musurgia'; and the 'Ars Magnetica' (1641), a collection of songs which were supposed to be specifics for the cure of the bite of the tarantula. An extremely rare and curious work is the 'Tractatus secundus de naturæ simia seu technica macrocosmi historia' (London, 1624), by Robert Fludd, an English mystic and physician who has been credited with the invention of the barometer. There is a quaint chapter in the book on music. The oldest book in the collection is the "Musica" of Boethius, who died 524 A. D., and left behind him in this work the old Greek scales of Ptolemy and the theories of Pythagoras. The book was printed in 1491. There are also a perfect original edition in Latin of Fux's 'Gradus ad Parnassum' (Vienna, 1725), the text-book which Mozart and Haydn studied, and a fine copy of the great violinist Tartini's 'De Principj dell' Armonia Musicale' (Padua, 1767). In addition to these, there are such rare works as Rameau's 'Génération harmonique' (1738); 'Observations on the Chorus of the Papal Chapel,' by Andrea Adami da Bolsena (1711); 'Il Musico Testore,' by Zaccaria Teno (1705); 'Il Tesoro Illuminato,' by Aijquino Bresciano (1631); Berton's 'Traité d'Harmonie' and 'Dictionnaire des Accords' (1822); 'Historia Musica,' by Andrea Angelini Bontempi (1692); 'Canto Harmonico,' by Andrea da Modena (1690); and 'Trattato sopra le Fughe Musicali,' by Sabbatini, a pupil of Padre Martini (1802).

Among other works, though not in the above class, are Joaquin de Vasconcello's bibliography of Portuguese composers; all of Coussemaker's splendid volumes; Antoine Vidal's beautiful 'Les Instruments à Archet,' with Hillemacher's etchings; Jones's 'Bardic Museum' and 'Musical and Poetical Relics of the Welsh Bards'; all of Ritson's volumes on the early English ballads; Gerbert's famous 'De Cantu et Musica Sacra' (1774), and his 'Scriptores ecclesiastici de musica sacra' (1784); Gevaërt's works; the bibliographies of church music by Wackernagel, Clements, Winterfeld, and Herculeus; Czerwinski's 'Dances of the Sixteenth Century'; the standard biographies of every prominent composer and many curious old sketches of the ancients; a full line of histories in every modern language; the "gesammelte Schriften" of Berlioz, Cherubini, Wagner, Liszt, Schumann, Mendelssohn, Hiller, and other composers, including also their letters; and the dictionaries of Busby, Rees, Hiles, Smith, Jousse, Stainer, Brande, Browne, Grove, Rousseau, Choron and Fayolle, Fétis, Escudier, Coussemaker, Castil-Blaze, Forkel, Reissmann, Koch, Ambros, Riemann, Gerker, Bernsdorf, and Mendel, besides a good representation of the Spanish, Italian, and Flemish lexicons.

In the periodical department there are already on the shelves complete files of the *Allgemeine Musikalische Zeitung*, Scudo's *L'Année Musicale*, *Dwight's Journal of Music*, the *Harmonicon* (without which no library would be complete), the Hofmeister series, Chrysander's *Jahrbücher für Musikalische Wissenschaft*, Eitner's *Monatshefte für Musik Geschichte*, the London *Quarterly Musical Magazine*, the *Signale für die Musikalische Welt*, and the *Bayreuther Blätter*, and there are now on the way complete sets of the London *Musical World*, London *Musical Times*, Escudier's *L'Art Musical*, the *Berliner Allgemeine Musikalische Zeitung*, Schumann's *Neue Zeitschrift für Musik*, Hiller's *Wochentliche Nachrichten*, the *Musikalisches Wochenblatt*, and the *Gazette Musicale*, founded in 1845 by Ricordi at Milan.

In this necessarily incomplete sketch I have omitted all reference to the current publications and those of the last few years. My purpose has been to indicate the great value of the library already to the musical scholar, and to foreshadow the splendid collection which, in a year or two at most, will challenge any library in the country for completeness in every branch of musical research. And when I add that in all the other departments of the library equal taste, culture, and enthusiasm are at work to build it up, and that Mr. Poole is surrounded by a corps of expert assistants, its future usefulness can hardly be overstated. As the work of a single year, its growth is already remarkable.

GEO. P. UPTON.

THE ITALIAN FLEET.

LEGHORN, April 6, 1889.

"THE rise of iron-ship building in Italy is almost a romance," wrote the London *Engineer*, while Sir Charles Dilke, an expert in naval expenditure, is astonished at "how much Italy gets for her money," and shows "that Russia spends more upon her navy than Italy does, yet as a matter of fact the Russian navy is not worth counting by the side of the Italian navy of to-day; that Italy, in addition to the two splendid ships she has at sea, is building or equipping eight first-class sea-going iron-clads as against seven being built by France and eleven by England, and she certainly seems to have, as regards the material of her fleet, achieved remarkable results at a low rate of cost."

If Italy has succeeded in connecting "romance" and iron-ship building, the palm of poetry must be conceded to her in modern as in ancient times; and if this be due, the merit must be shared by all her best and wisest, without any distinction of party, of rank, or of wealth. Here in Leghorn, in the house of the Orlando brothers, where I am writing in the large, long dining-room, built in fifteen days for the guests—Queen Margaret included—invited for the launch of the *Lepanto*, the truth stranger than fiction is forced on one. Throughout 300 years of slavery, Italy's war and commercial navy had declined to zero. But for Nelson, the French fleet would have swept the seas and the Bourbons with their belongings into it: nor did the Revolutionary Government of 1848 realize that not until Italy should regain something of her former strength upon the sea could she hope to hold such liberty and independence as she might gain. Garibaldi's was a voice in the desert till Cavour heard and was penetrated by its urgency. In 1855 the four brothers Orlando, exiled for their participation in the Sicilian revolution, "while waiting for the next summons," set up business as engineers at Pila, between S. Pier d'Arena and Genoa, and in 1855 induced Cavour, then Minister of Public Works, to give them a commission to build an iron-clad. The first iron-clad built in Italy, the *Sicilia*, a paddle steamer, 108 feet long, displacement 200 tons, speed at trial ten knots, was launched successfully, and so pleased Cavour that when the numerous arrests for the Pisacane expedition were made, the Orlando brothers, though neck deep in the conspiracy, went scot free, though warned that "next time, iron-clads or no, they would be banished from the kingdom." Patriots first, then shipbuilders, three out of the four brothers were of the thousand who landed with Garibaldi at Marsala in 1860.

In 1865 they transferred their business to Leghorn, where their iron works now cover a surface of 93,000 square yards, the workshops 26,222, and the docks—constructed with all the latest improvements—50,000 yards. The dry-dock is 443 feet long, there are five building slips, two rail slipways that can launch a ship 333 feet long. Besides the workshops for shipbuilding and boilermaking, the brothers have a foundry with five furnaces, and cranes that lift 38 tons, and they can cast pieces of 40 tons weight. In the building-shop, which measures 440 by 73 feet, supplied with the most modern machinery, there are three travelling cranes of 40 and 20 and 10 tons, an enormous machine that planes a surface of 20 by 17 feet, and a large double lathe with four cutters which can turn a nine-foot diameter. The works are supplied with a large steam crane of 70 tons, 70 feet high, for laying on board boilers, engines, masts, guns, and armor. They employ from 1,200 to 1,600 hands, and the perfect union between masters and men is delightful to see.

In 1876, owing to the failure of the Trinacria company, the brothers had to offer a composition to their creditors. The majority agreed, and gave a long time to pay off the capital and interest, but the small fry refused, and failure seemed inevitable, when Garibaldi, who, to his grief, had accepted the national gift, insisted on their taking part of it as a loan—would accept no refusal, ordering Luigi "to be silent and obey." The firm was saved, and capital and interest were repaid years ago. A few years later the first-class war ship *Lepanto*, displacement 13,550, horse-power 18,000, speed 18 knots, length 400 feet, breadth 73, water draught 28, greatest thickness of armor (on towers) 19 inches, carrying four guns of 103 tons each, was launched triumphantly. Owing to the limited space of water and the great weight of the ship, the direst prophecies were in circulation. The Government quaked, the workmen trembled, their women folk spent treasures to secure the "Madonna's" protection, and during the ceremony said aves and paternosters

aloud. But the brothers—now aided by sons who are certificated engineers of the first class—had spent $60,000 to make all safe on the stocks, and the *Lepanto*, feeling that the future fate of private shipbuilders was at stake, behaved like a true daughter of the soil, quitting it with graceful ease for her native element. We have now just been over the *Fieramosca*, a seventeen-knot vessel of the type of the *Giovanni Bausan*, built by Sir William Armstrong & Co. at Newcastle-on-Tyne. She is to be armed with 25-ton Armstrong breech-loaders, mounted in an unarmored barbette, fore and aft, six 6-inch sponson guns, eight rapid-fire and machine guns, four torpedo tubes. This firm also built the *Clio*, the first torpedo boat built in Italy, and has launched five first-class torpedo boats, two armored gunboats (specially built for river service), the torpedo ram *Vesuvio*, with numerous steamships, gunboats, steam race yachts, despatch vessels, salvage boats, and fresh-water tanks, cutters, etc. And when one private firm has done all this, the rapid progress made by Italy is explained.

The necessity of being strong on the seas is now recognized by all, and can scarcely be expressed more strongly than in the words of Gen. Ricci, late chief of staff of the Italian Army, who in a speech to his constituents in 1887 made, for a soldier, the following remarkable statement:

"Our continental frontier is one of the strongest in the world, because the Alps, fortified as they are, and defended by 250,000 or 300,000 Italians, present an impassable barrier. I even dare say that we are too strong on the side of the Alps, and I wish to again ask the Chamber to economize here as much as possible in order to increase the naval budget, so that we may have enough ships to prevent attack on our coasts, *the weak point—the very weak point—of Italy.* . . . Every time that I, General of the Army and Alpine Deputy, appear in Parliament, I shall say 'All for the Navy.'"

But the country was slow in coming to this conclusion.

After the disaster of Lissa—due not solely to the blundering, irresolute, and timid Admiral, but also to the ignorance (in naval matters) of the Minister of the Navy, and the absence of unity in direction between the land and sea forces—Italian naval construction, instead of increasing, visibly declined. With Venice freed and Rome only to be occupied by "moral force," with crippled finances and universal discontent, the men then in power determined on "economy to the bone," utterly neglected the navy, and, to the disgust of the soldier King, cut down military expenditure to the lowest possible minimum. The Liberals (then in opposition) never ceased to insist on naval constructions and well-defended arsenals, always giving their support to the Minister of the Navy, even when hostile to the Cabinet as a whole. A remarkable instance of this was given in 1875, when the entire Liberal forces were combined to overthrow the Minghetti Ministry on account of its outrageous conduct during the recent elections. Garibaldi had just arrived from Caprera, appearing for the first time in Rome since 1849, and the terrified Ministry placed the city almost in a state of siege. Admiral Bon, who, from the time he assumed the naval office in 1873, had insisted on the inadequacy of the Italian fleet even to defend the coast, and on the insufficiency of the funds allotted, affirmed that the first step to be taken towards naval reform must consist in putting at least thirty-three out of the seventy-three men-of-war then kept in commission under the auctioneer's hammer, and to use the proceeds and the yearly appropriations hitherto uselessly spent in repairing wooden ships and converting iron guns in constructing steel and new iron ships and guns. Garibaldi, who had just taken the oath (the entire House, deputies and spectators, madly acclaiming him), stanchly supported the proposition, and Signor Bon's organic plan of reform was discussed and voted even by the most violent adversaries of the Cabinet.

When, in the following year, the Left seized the helm, the question of fortified arsenals, coast defences, naval constructions, combined with a total reform of the army system, was studied and discussed, and a certain progress was visible yearly—avowedly and actually for strictly defensive action. Italy, being at peace with all the world, calculated on devoting her time and money to internal reforms, to public works, to the development of her commerce and industries, but could not shut her eyes to the fact that republican France was even more hostile to her unity than monarchical France had shown itself, and as hostile to her rising power as the Empire had been after the consolidation of the nation by the conquest of Venice. This hostility was accentuated during the absolute dictatorship of M. Thiers, who had protested vehemently against the war of 1859, who had forced Rouher to the famous assertion that Italy should "never" rule in Rome, and who would willingly have done his very best to turn the Italians out of their capital. Hence a sudden fervor for fortifying Rome; but Garibaldi laughed the Government pretty well out of this absurdity, showing the impossibility of preventing a sudden descent on Rome when once an army had succeeded in landing:

"This army," he observed drily, "will not walk within range of your guns on Mount Mario! Hence you must fortify all the seven hills, and, when you have done this, must erect an outer system of forts. And even then? Think of the fortifications of Paris; of what use were they? And pray how long did the terrible fortifications of Nicopoli prevent the passage of the Danube? Your coast and islands are undefended, accessible to all who want to land. You must be able to blockade the enemy, to prevent him from issuing from his ports to attack yours, and this you can only do by creating a fleet worthy of our nation. You are ruining us by your useless army expenditure. The armed nation is your only resource, and until you *do* adopt the American or Swiss system, as long as you *will* have a standing army,* stick to short service and long reserves; don't keep a twentieth part of your men under the colors, stultifying them in barracks and depriving the soil of their labors, but give them military instruction in their own homes, drill and discipline them, encourage target-shooting, let every able-bodied male know how to handle a rifle or a carbine. This for the infantry. The 'special' arms—artillery, cavalry, engineers—must be brought to perfection; but remember that the *most special* arm for Italy is her navy. In neglecting her navy Italy is deliberately committing suicide."

Italy's political situation must be taken quite as much into account as her geographical configuration, when we come to examine the class of war ships which she has set herself to produce. While not pretending to dominate the Mediterranean, she cannot allow it to become a "French lake," must have a fleet sufficiently powerful to hold her own without allies against a French fleet which threatens her from Toulon, Corsica, and now from Biserta. Again, if, as at present, she be allied with great Continental Powers, her fleet is just as essential to prevent a foreign fleet from hindering her mobilization and from destroying her railroads, all of which can be reached from the sea. Hence, her resolve to possess a few first-class ships, with all-powerful ordnance, the utmost possible speed and utmost capacity of coal-bunkers. Her abandonment of side armor as a protection to stability has been severely criticised by some great authorities and highly praised by others. She believes that her monster iron-clads are the only true defenders of her extended, defenceless coast from bombardment or invasion, and counts not a little on her numerous torpedo boats for attacking the bottoms of the enemy's ships. Her first monsters were the *Duilio* and the *Dandolo*, central citadel battle ships of 11,000 tons each, speed fifteen knots, with four 100-ton guns in turrets. These ships are 346 feet in length, the armored belt 107 feet long. Later, the naval authorities demurred at the deficiency of coal endurance of ships of this type—a fatal defect this for *coalless* Italy, borne in later on their minds by England's rigid adherence to the laws of neutrality in refusing permission to France to coal at her coaling-stations during the war with China. So the *Italia* was planned, and is, with her successors, placed by Lloyd's in their Universal Register as "sea-going armor-clads." They carry lofty armored towers and a curved armor deck, "just," says Mr. King, "to keep out shot and shell from the engines and boilers, the magazines, shell-room spaces, and the channels leading therefrom to the upper deck, and to protect the guns in the casemate when not elevated above the battery and the gunners employed in firing them. But all other parts of the ship above the armored deck, all the guns not in the casemate, and all persons out of the casemate and not below the armored deck, will be exposed to the enemy's projectiles." This abandonment of side armor is defended by the majority of Italian naval authorities. The *Re Umberto*, *Sicilia*, *Sardegna* are identical. The attention Italy is paying to her torpedo fleet has called forth the following remark from a French retired admiral, who writes to M. Branda, author of 'Réformes Navales—La France sur l'Océan': "We are ready for nothing; we have nothing, not even twenty-five torpedo boats to range alongside our iron-clads, a kind of tortoise out of which we drag ten or eleven knots with difficulty, *and which are going to have to deal with the Italian fleet* backed by a hundred torpedo boats in fighting trim and steaming fifteen to eighteen knots."

To show Italy's progress in naval construction, we may put the situation of the royal navy at the end of 1886 thus: First-class iron-clads 18, second-class 3; first-class transports, store and troop ships 4, second-class 4, third-class 11; training ships 3; for local uses 11; gunboats 6; high-sea torpedoes 2; first-class torpedo boats 62, second-class 21; total, 179. During the year 1888 the following war ships were launched from royal dockyards and private home and foreign shipbuilding yards: *Principe Umberto*, first-class, 13,298 tons, built at Castellamare; torpedo ram, *Fieramosca*, 3,745 tons, Orlando brothers; torpedo ram, *Piedmont*, 2,500 tons, built by Armstrong, Newcastle; two torpedo cruisers, *Montebello* and *Monzambano*, 741 tons each, built at the royal arsenal at Spezia; five torpedo despatch-boats of 129 tons each, viz., *Aquila*, *Avoltojo*, *Falco*, *Nibbio*, *Sparviero;* the gunboat *Curtatone*, 1,050 tons, at Venice; 35 high-sea torpedoes, 85 tons each; 2 first-class coasting torpedoes, 34 tons each. Nearly completed, commenced in 1885, are the first-class iron-clad *Sardegna*, 13,860 tons, royal arsenal, Spezia; the *Sicilia*, 13,298 tons, laid down in 1884, royal arsenal, Venice; the torpedo cruiser *Confienza*,

* Such was Garibaldi's horror of standing armies that, even as he had watched with intense anxiety for the preservation of the Union and for the abolition of slavery, so, after the final triumph, he watched with equal keenness for the return to the *status quo ante bellum*. "If the United States maintain a standing army, it will be their ruin. Armed men want to fight for fighting's sake," he said.

745 tons, royal arsenal, Spezia. The *Doria* and *Morosini* iron-clads of 11,000 tons each, launched in 1888, are now arming. The following ships were laid down in 1888 and are on the stocks in the royal and private dockyards: torpedo despatch-boat *Marco Polo*, 3,759 tons; cruisers, *Lombardia*, *Liguria*, *Umbria*, and *Etruria*, 2,281 each; torpedo cruisers *Aretusa*, *Minerva*, *Urania*, *Partenope* A and B, 845 tons each, and a towboat.

Hence Italy last year launched 56 war ships of 26,300 tons total; 12 vessels of 18,021 tons were laid down; while seven ships of 50,129 tons laid down or launched before 1888 are being armed and equipped.

Side by side with her shipbuilding and gun fabricating, or purchasing, the Italians are paying the utmost attention to the enrolment and instruction of marines, and especially to the education and practical training of naval officers. In the Naval Academy, which we have just visited, 315 youths are distributed into five classes. Those who are to be naval engineers must pass two years in the University of Genoa. "Young Italy on the seas" may yet prove a trusty friend, a dangerous foe.

J. W. M.

BERNADOTTE'S QUEEN.

MARSEILLES, March 9, 1889.

THE recent death of Count François Clary, ex-Senator of the Empire, naturally brings up remembrances of the Clary family, which—except, of course, the Bonapartes—was, on the whole, the most distinguished of the new families created by the French Revolution. Its founder was also François Clary, a wealthy merchant of Marseilles who died in 1794, before the social fortune of his family had been dreamed of. He had two sons, one of whom succeeded to the business, and four daughters. Of these one married a member of the well-known family of Villeneuve; another, Baron Antoine de St. Joseph, a remarkable economist, who belonged to a family of magistrates, and had distinguished himself by travels and commercial combinations. He lived at Constantinople for ten years as head of a commercial house, and finally projected a commercial alliance between Russia, Poland, and France to develop French commerce with the Black Sea. The idea was warmly taken up by Catharine II., and was adopted by the French Government on the recommendation of the Abbé Raynal, with the aid of Count de Ségur; and it was successful. Timber and other merchandise were brought by the Dnieper, the Black Sea, and the Mediterranean to Marseilles in three months, which, by the old route of the Baltic and the ocean, would have taken three years to arrive. Antoine amassed a large fortune, and in 1786 was made a Baron. One of his daughters married Marshal Suchet, Duc d'Albuféra; the other, the Admiral Duc Décrès, Napoleon's Minister of Marine. François Clary's third daughter, Julie, married Joseph Bonaparte, and was Queen of Naples and of Spain. The fourth daughter, Désirée, married Bernadotte and died Queen of Sweden. His niece—the sister of the just deceased Count François Clary—married the Prince de Wagram, son of Marshal Berthier; and since then the Clarys have become allied with the Murats, the Niels, the Turennes, the La Croix-Lavals, and other distinguished families both of the Imperialist and the Legitimist aristocracy.

Baron Hochschild has recently published a little book, 'Désirée, Reine de Suède et de Norvège' (Paris: Plon, 1888). As the author had seen much of the Queen's circle at Paris when he was a boy—his father being Swedish Minister there under the Restoration—and as he was subsequently for many years her chamberlain, he is able from her conversations and letters to tell us much that is new and interesting. Bernardine Eugénie Désirée Clary was born in 1781, and was early sent to a conventual school; but her education was arrested by the suppression of the convents, and soon after her return home her father died. She had but slight recollections of her child-life at home, except when chance brought up some incident. On one of these she liked afterwards to dwell. There came one day to her father's house a quartermaster-sergeant with a billet for quartering soldiers. As her father hated the row and disturbance which soldiers generally made, he sent him off with a letter to his colonel asking for an officer or two instead. The sergeant thus turned off was Bernadotte. In 1794, after her father's death, her elder brother was arrested. Her sister-in-law was in despair, for the Revolutionary tribunals were terribly expeditious. She resolved, therefore, to go and see the Deputy Albitte; and, not wishing to be alone, took Désirée with her. There was a crowd of people in the waiting-room, and, owing to weariness, heat, and emotion, the little girl fell asleep. When she woke up at the noise of a door being shut, she found herself in total darkness, except for a lantern shining from the adjoining room. As it turned out, her sister had hesitated to awake her when she went in to see the Deputy; and then, being in a great hurry to deliver the order for her husband's release, had left her, thinking she could easily find her way home.

"Meanwhile, I was somewhat frightened, not understanding at all my situation, when I perceived that I was no longer alone. At the movement which I made, a man, who came out of the Deputy's room, approached me, and, looking at me with surprise, asked how I came to be there all alone at that hour. When I explained to him what had happened, he reassured me about the fate of my brother, and added: 'A little lady like you cannot go alone in the streets at night, so I will walk home with you.' On the way home we talked so much that we became very good friends. As he went away, I said that my mother would certainly like to thank him herself for the care he had taken of me, and begged him to call upon her. 'Then you will present me to your family one of these days?' he said. 'With pleasure,' I replied; 'meanwhile I should like to tell them the name of the gentleman who has protected me this evening.' 'That is perfectly right—you may tell them that my name is Joseph Bonaparte.'"

The call was made the next day: Bonaparte soon became intimate with the Clary family, and before many weeks had passed was engaged to marry Désirée as soon as she should reach the age of sixteen—she being then only about thirteen. Joseph often spoke about his brother Napoleon, who had just drawn attention to himself at the siege of Toulon. When, soon after, he came to Marseilles, he was taken to see the Clarys. He was at that time full of noisy gayety and quite a good fellow.

"His arrival," Queen Désirée related, "soon brought about a change in our plans for the future. We had not known each other long when he said: 'In a good household one of the married pair ought to yield to the other. Now, Joseph, you have an undecided character, and it is the same with Désirée; while Julie and I know what we want. You would do better, then, to marry Julie; and, Désirée,' he added (taking me on his knees), 'she shall be my wife.' And that is the way that I became betrothed to Napoleon."

Joseph and Julie were married soon after; and before Napoleon's departure from Marseilles—where he had excited against himself great difficulties, and had even been called to appear before the bar of the Convention—Mme. Clary had consented to his marriage with Désirée as soon as she should be sixteen. Napoleon and Désirée at first wrote often to each other; but of this correspondence there are preserved only the drafts of some of her letters. He was taken up with his affairs at Paris, and his letters to his fiancée became less frequent, though he never wrote to Joseph without mentioning her. She had then gone with her mother to stay with Joseph, who had been charged with a Government mission at Genoa. Meanwhile, Napoleon had fallen in love with Mme. de Beauharnais, and his letters to his brother showed more indifference to his little Désirée—or his Eugénie, as he preferred to call her. At the same time he had a little pique because, in 1795, during a journey in Liguria, she, either offended by his apparent neglect or alarmed at reports of his intimacy with Mme. de Beauharnais, had for a time ceased writing to him. He asked Joseph in one letter whether one passed the river Lethe in going to Genoa; and advised him not to give the portrait which he had sent "to one who seemed to have forgotten him, unless she asked for it again." Désirée, however, was not as inconstant as Napoleon imagined. She told afterwards how much she had suffered from his abandonment of her; and her young friends, to whom she had evidently communicated her sorrows, were satisfied of the same thing. When Napoleon married Josephine, Désirée, who was only fourteen, wrote him a touching letter, such as an older person would probably not have written:

"After a year of absence, I thought I was nearly happy, and was hoping to see you again soon and become the happiest of women in marrying you. But no! your marriage has made all my felicity vanish. It is true that I was in the wrong towards you; but you would have found me again so tender, so constant, that I was daring to flatter myself that you would pardon me everything. The day of your leaving Marseilles was very painful for me; but at least I had the hope of being one day married to you. Now the only consolation that remains to me is to know that you believe in my constancy; after which I desire only death. Life is a frightful torment to me since I can no longer consecrate it to you. I wish you all sorts of happiness and prosperity in your marriage; and hope that the wife you have chosen will render you as happy as I purposed to do, and as you deserve. But in the midst of your happiness do not altogether forget Eugénie, and pity her lot."

Wounds of the heart—especially at that early age—are soon healed; but although Désirée forgave Napoleon, she always kept a little grudge against Josephine, who had taken him from her. Sixty years afterwards she says:

"For a man of genius like Napoleon to let himself be subdued by an elderly coquette of notably doubtful repute, proves him without any experience of women. Even after his second marriage, Josephine made herself talked about, and it was not without good reason that her husband required her to join him during the Italian campaign, and that on his return from Egypt he determined to separate from her."

Mme. Clary and her daughter continued to live in Genoa as long as Joseph Bonaparte remained there, and Désirée became very intimate with Mme. Faipoult, the wife of the French Minister, who had a charming salon, frequented by all well-bred French who had taken refuge in Genoa, and by many officers of the army of Italy. Here General Duphot paid court to her, but his addresses were rejected. Faipoult, who was interested in Duphot, was anxious to forward his prospects by a marriage not only brilliant from a pecuniary point of view, but on account of the relationship to Bonaparte, and succeeded in having Duphot attached to Joseph Bonaparte's embassy to Rome, besides obtaining a promise from Désirée to

receive him politely. Duphot had meanwhile communicated to Napoleon his hopes and wishes, and the latter—doubtless desirous that his old love should marry as soon as possible—wrote to his brother: "General Duphot will deliver to you this letter. I recommend him to you as a very good fellow. He will speak to you of a marriage which he wishes to make with your sister-in-law, an alliance which I think to her advantage; he is a distinguished officer."

Whatever might have happened—and there were serious obstacles in the shape of an illegitimate child of Duphot—his death put an end to everything. The arrival of an embassy from the French Republic caused a crowd to assemble in the neighborhood of their palace and make manifestations against the Papal Government. On the evening of December 27, 1797, the Papal troops interfered and fired on the mob. Joseph Bonaparte, Duphot, and Adjutant-General Sherlock went out to stop the conflict. Duphot was simply massacred by the soldiers; the others had barely time to reënter the house. His body was afterwards recovered and brought in. Joseph Bonaparte, in describing the event to Talleyrand, says: "My wife and her sister, who was going to be next day the bride of the brave Duphot, were forcibly carried away by my secretaries and two young artists." Baron Hochschild in 1856 read aloud to Queen Désirée the correspondence of Joseph Bonaparte, and the Queen interrupted him with: "But that is not true; Joseph merely wanted to make a fine phrase. I should never have married Duphot, who did not at all please me." Désirée left Rome with Joseph Bonaparte immediately afterwards. Her stay there had been so short that she had not even had time to go to St. Peter's; and her sole recollection of Rome was the terrible scene she had witnessed from the top of the staircase of the French Embassy, when the mangled body of Duphot was brought in.

On her return to France, her beauty, her wealth, and her connection with the Bonapartes brought her numbers of admirers. One of the proposals for her hand is charmingly told. After his return from Iceland in 1856, Prince Napoleon came to Stockholm accompanied by the Duc d'Abrantès (son of Junot), who asked for a private audience of the Queen Dowager Désirée. When it was over, Hochschild found her thoughtful and dreamy. "To think," she said, "that I could have married his father! There was a time when Junot proposed to me, but he was awkward about it, and asked Marmont to do it for him. Ah! if Marmont had spoken in his own name—who knows? I should perhaps have said 'Yes'; he was so handsome."

In 1798, Bernadotte, who was then a general of division, had been Ambassador at Vienna, and was soon to be Minister of War—no longer the Sergeant Bernadotte who had knocked in vain for lodgings at the door of the Clary house at Marseilles, but who was now intimate with Joseph Bonaparte—proposed to Désirée. She did not know him well, but, as she said, "he was something different from the others I had refused, and I consented to marry him when they told me that he was a strong enough man to hold his own against Napoleon." The marriage took place on August 17, 1798. Napoleon was in Egypt, and used no influence in the matter. When he heard of it he wrote to Joseph: "I wish happiness to Désirée if she marries Bernadotte, for she deserves it."

The Bernadottes settled in Paris, and the next year their only son was born, who was afterwards known as King Oscar I. Happy, both as a wife and mother, Désirée saw Napoleon, after his return from Egypt, without embarrassment, and their relations always remained very cordial. She several times had the power of warding off his wrath from men who, he thought, opposed his plans. But Bernadotte, being a good general, had frequently to be absent; and Désirée would have passed a lonely time had she not, in addition to her child, had the society of her sister Julie. The letters of Bernadotte to his wife, written when he commanded in La Vendée, are interesting, because they show him rather as a paternal friend and counsellor—he was twenty years older—than as a husband, although there is occasionally noticeable a little marital jealousy. Bernadotte himself gave no cause to his wife to be jealous, which seems to have piqued Mme. Récamier, to whom he was apparently devoted. "Explain to me," she said one day to Mme. Bernadotte, "how it happens that whenever your husband chances to be alone with me in the woods, he always talks about politics." It is amusing, too, to find that, three years after her marriage, Mme. Bernadotte was taking music and dancing lessons, to the great delight of her husband, who was anxious to have her complete her education.

The proclamation of the Empire and the promotion of Bernadotte to be Marshal made little impression on his wife. She had seen so many extraordinary things since she was a child that everything seemed natural. So also, when he was made Prince of Pontecorvo—though she feared for a moment that it would be her duty to settle in Italy, according to the wish of a deputation from the little principality, until she was told that it was merely a title, without responsibility. When Bernadotte was sent as governor to Hanover, and afterwards to Hamburg as commander-in-chief, they were separated for a long time, but they were in constant correspondence, and she was able to keep him informed of everything going on in France. At this time she lived quietly in the hôtel which they had bought in the Rue d'Anjou St.-Honoré, and enjoyed the society of sisters, nieces, and other friends who, for political and various reasons, did not care to frequent the gayeties of the Tuileries and St. Cloud. Although her relations with Napoleon were always pleasant—he even gave her one of the three splendid fur cloaks presented to him by the Czar Alexander at the interview at Erfurt—her antipathy to the Empress Josephine and to Queen Hortense kept her from the Tuileries except on official occasions. She had parted regretfully from her sister Julie on the latter becoming Queen of Naples, but as Julie refused to follow her husband to Spain, the intercourse of the sisters was constant till 1814, when the Bonapartes were expelled from France.

After the battle of Wagram, Napoleon openly showed his dislike to Bernadotte; but a partial reconciliation was patched up, and the latter was appointed Ambassador to Rome in order to get him out of the way. Before he had started for his post, however, he was elected Crown Prince of Sweden. His wife received the news with perfect indifference; she had never interested herself about foreign countries except Italy and Spain, and would probably have been puzzled to tell where Sweden was situated. "I thought," she said, "that it was like Pontecorvo—some place of which we were merely going to take the title." She was in despair when she found that she was to go and live there and be separated from her family and friends. Nevertheless, she resigned herself, and arrived at Stockholm soon after her husband. Although she was touched by the old King's reception of her, yet she could not resist the temptation of returning to Paris, especially as none of her French ladies were willing to stay in Sweden. Bernadotte did not oppose her departure. We do not know his exact reasons: he may not have felt sure of his position in Sweden so long as the dispossessed Prince of Vasa was alive and the political relations of the Continent were unsettled; but we know that he felt sure that the Empire of Napoleon would not endure for long. He may have had some ambition to be Napoleon's successor; at all events, Bourrienne says that the Emperor Alexander gave him to understand at the interview at Abo in 1812 that the fall of Napoleon would not necessitate the return of the Bourbons, and that if Frenchmen should offer him supreme power, he could count on the assistance of Russia.

The Crown Princess, under the name of Countess of Gotland, returned to her old hôtel in Paris, which she continued to occupy for thirteen years. She received not only her old friends, but all the Swedes of distinction who passed through Paris. She was in constant correspondence with her husband, informed him of what was going on, and was on several occasions intermediary between him and French political men. Her position in 1813-14, after Bernadotte had alienated French sympathy by taking part against Napoleon, was a difficult one. The person whom she saw with most pleasure, outside of her intimate circle, was the Queen of Westphalia, "who was," she used to say, "a good-hearted woman, always ready to sacrifice herself to duty. Although our husbands were in opposite camps, she never ceased showing to me her sympathy and friendship." When, after the Restoration, Louis XVIII. had expressed a desire to be agreeable to her, she thought she might interfere in favor of her sister, the ex-Queen of Spain. But the King was inexorable.

Charles XIII. died in 1818; but the new Queen constantly saw reasons for adjourning her departure from Paris. She said one day, speaking of music: "I was playing the overture to the 'Caliph of Bagdad' when the death of the King was announced to me; since then, I have never touched my piano, thinking that when one is Queen one ought not to play badly." In 1822 she went to Aix-la-Chapelle to meet her son Oscar, who was then travelling on the Continent; it not having been considered best for him to enter France. She had not seen him for twelve years, and found him a handsome young man. The few days they passed together probably hastened her departure for Sweden. She then went to Brussels to meet her sister Julie Bonaparte, who had obtained especial permission to come there for the marriage of her daughter Zenaïde with her cousin Charles. As she wished to prolong her stay there, the Queen of Sweden wrote to Mme. de Récamier to use her influence to that end with her friend Mathieu de Montmorency, then Minister of Foreign Affairs. Before returning to Paris, she went to Switzerland and stayed some time at Prangins. While there, she received the news of the betrothal of her son with the Princess Josephine de Leuchtenberg, the eldest daughter of Eugène Beauharnais. The marriage by proxy took place at Munich; and at the same time Queen Désirée left Paris so as to meet her daughter-in-law at Lubeck and arrive at Stockholm with her. Josephine was at that time barely sixteen years of age, and took with her her favorite doll.

The Queen had had every intention of returning to Paris, but the King would not allow it. Although they had been separated from each other during nearly the whole twenty-five years of their wedded life, the King had a great respect and affection for her. He was,

however, unaccustomed to family life; and although Prince Oscar and his wife inhabited the same palace, they all had separate suites of apartments. Gradually she accustomed herself to this life of isolation, which she felt all the more on account of her ignorance of Swedish, and of the lack of French society. A southerner of southerners, she could not find the persons who surrounded her sufficiently sympathetic; and her great resource was to think and talk of her dear Paris, where her hôtel stood ready to receive her at any moment. The birth of numerous grandchildren gradually filled the void of her life; but once, after the death of her husband, she actually started to return to Paris on a frigate commanded by her grandson the Duke of Ostragothia, the present King Oscar. But, after getting a few leagues from Carlscrona, she felt herself unable to leave her land of adoption and returned. She afterwards pretended that this was only due to sea-sickness. Although she knew that she never should see Paris again, she became much alarmed by the plans of Baron Haussmann for the embellishment of the city. She could not bear the thought that the house where she had spent the pleasantest years of her life should be demolished. The Emperor Napoleon, hearing of her anxiety from his Minister at Stockholm, gave orders that her house should be respected until her death. This occurred peacefully and quietly on December 17, 1860, after she had already seen her grandson crowned King of Sweden. E. S.

Correspondence.

SOUTH CAROLINA CONVICTS AGAIN.

To the Editor of The Nation:

Sir: In your comments on my reply to your article, "Negro Convicts in South Carolina," after remarking that no one should "be sent to prison for even five years for stealing ten pounds of flour or a suit of clothes," you ask, "Can our correspondent point to the case of any white man receiving such a punishment?"

In answer to this inquiry, I send you, enclosed, a brief statement of such cases, given me by the Superintendent of the Penitentiary of this State. Among these cases I call your special attention to three: (1) John G. Jackson is sentenced to the Penitentiary for life for burglary, although in the act of burglary he succeeds in stealing nothing but a fiddle; (2) Thomas Cullen receives the same punishment for the same offence, though he succeeds in stealing only a pair of pants and $27; (3) P. B. Chappell, for stealing grain not yet severed from the freehold, is sentenced to one year's imprisonment. He is "said to have stolen twelve ears of corn from his own land which he had rented out to a colored man."

These, and all the cases given in the Superintendent's letter, are white men, and go to show that white men suffer the penalties of the severe laws against burglary and arson as well as the negroes. Whether these laws are too severe, I will not undertake to say; that question is foreign to my present purpose. Each State, in the light of its own experiences, will have to settle such questions for itself. South Carolina, for example, has very rigid laws governing the marriage relation—laws so severe that it is certain no Northern State would put up with them. We are "amenable to outside criticism of a disinterested and friendly kind." Unfortunately, not very much of this sort of criticism comes to us from the North; and even when it is of this character, it so often utterly ignores the conditions under which we live, that it is of no practical worth to us.

My remark about the gradual diminution of crime had reference only to the period between 1876 and 1883, as you will see by referring to my article. My object was to show why, in the latter year, the laws were relaxed and the punishment mitigated. But since about that time, crime seems to have increased—whether in consequence of such relaxation and mitigation I do not know. Certainly "the matter deserves further investigation." Such "further investigation" might reveal the fact that the punishments inflicted have no great terrors for the negroes. It might be discovered that a little Delaware justice (the whipping-post) would be more effectual than imprisonment in the Penitentiary. It is certain that some negroes have committed crimes *in order to* go to prison, where they might be fed and clothed without care to themselves, and might be relieved of the responsibility of providing food and clothing for their wives and children.

And there are other things that deserve "further investigation." Among these is the fact that insanity is increasing among the negroes, the increase in insanity being almost parallel with the increase in crime. There is no lack of phenomena in this race that "deserve investigation," and we welcome all investigation and criticism, "of a disinterested and friendly kind," that will enable us to do what is best for the collective interests of the people of our State.—Very respectfully,

W. J. Alexander.

University of South Carolina, April 24, 1889.

HIGH LICENSE IN PENNSYLVANIA.

To the Editor of The Nation:

Sir: In the issue of the *Nation* for April 25, you say, in reference to the operation of the so-called high-license law of Pennsylvania, "The single fact that there are in a city like Pittsburgh eleven wards almost entirely without a liquor saloon, is of itself an unanswerable argument in favor of the high-license principle as an effective agency for restricting the liquor traffic." This statement unless explained is calculated to create a false impression, and do not a little harm at the present time, when the merits of high license and prohibition are being contrasted in so many minds.

The Brooks law of Pennsylvania is not called a high-license law, and does not diminish the saloons upon "the high-license principle." The amount of the license fee is comparatively low, being $500, as compared with $1,000 and $1,200 in certain Western States. The amount of the license fee does not in the least degree act as a check to the increase of the saloons in Pennsylvania. The notable decrease of saloons in Philadelphia and Pittsburgh is due to the operation of certain prohibitory features engrafted in the law. The chief of these is the discretionary power given to the judges to refuse a license to a man even when he is able and willing to pay the license fee. The judges in Philadelphia are hearing the applications for licenses at the present time, and a far greater number of applications are being made than there is any prospect of their granting. It seems evident, then, that this diminution of the saloons of Philadelphia and Pittsburgh cannot be said to be "an unanswerable argument in favor of the high-license principle," when the law is not known in its title as a high-license law, when, as a matter of fact, it does not call for a high-license fee, and when, also, it is apparent that the amount of the fee has nothing to do with the diminishing of the saloons.

It could be shown that in other portions of Pennsylvania this same Brooks law has, in the hands of judges who favored the liquor interests, actually increased the number of the saloons; and it could be further shown that in Nebraska, where the license fee is twice as large as in Pennsylvania, the saloons have flourished under it, and grown to be a controlling influence in certain portions of the State. My contention at present, however, is, that the operation of the Brooks law in Pennsylvania cannot be fairly quoted as an argument in favor of high license.

I trust that you will give to this letter the same publicity that was given to the statement that called it forth.—Yours respectfully,

Alex. Henry.

Frankford, Pa., April 25, 1889.

THE THREE-MILE LIMIT.

To the Editor of The Nation:

Sir: The comment of "R.," of Halifax, on my little paper on the so-called three-mile limit caused that natural and proper sense of mortification when one has ventured to be a teacher, however humbly, and finds he was entirely ignorant. On reading the comment, and assuming the quotations correct, I saw their inconsistency with the passage I had quoted. I knew there could be none, and that it was my incapacity to harmonize them. It would never occur to me in the height of my presumption to question the correctness of such men as Sir Alexander Cockburn as a lawyer because I cannot understand him. To men of the class of Eldon, Kingsdown, Wensleydale, and Cockburn, etc., I bow as a devout Catholic before an inscrutable dogma. My experience is that ultimately I am rewarded by the full fruition of understanding. I have meditated for twenty years over one of these men's sayings before I fully appreciated their profound meaning.

Judge, then, of my gratification at finding that the excerpts establish my position, if read as I read them, and as I am quite confident they should be read.

Sir Robert Philimore's remark, p. 81 (2 Ex. Div.) refers to the neutral zone of three miles about which no one ever questioned. It is a limit within which warlike operations are forbidden because of the risk to the neighboring land and its inhabitants.

The quotation from Sir Alexander, p. 205, is a statement not of the law as it is, but of what it *would be* if there was the jurisdiction assumed by "R.," but which Sir Alexander is then denying. This is perfectly clear if the context is looked at. He is explaining why the arrangements about fishermen have always been made by treaty—because it is proper that there should be such a power to regulate, *but there is none*, and hence the treaty.

The citation from 208 is odd if "R." be a lawyer, whether English or American. The Chief Justice says no more than, If Parliament sees fit to legislate, of course we the judges will obey. He is referring then to the English doctrine of the omnipotence of Parliament. And please observe, the point under discussion was the intention of the law. Could it be supposed that the criminal law of England governed a foreigner in a foreign ship, because she was within three miles of the coast? He was pointing out that Parliament might so enact, and if it did, the courts must obey—for it was for Parliament, and not the courts, to say whether England would enact a law that would give a just cause of war to Germany.

I think any one who will reflect must see (which was my point) that the existence or non-existence of the criminal law of a country at a particlar place depends entirely and absolutely

on jurisdiction—and C.-J. Marshall has said *this is of necessity exclusive.* R. C. W.

PHILADELPHIA, April 27, 1889.

MR. PEARSON'S TREATMENT.

TO THE EDITOR OF THE NATION:

SIR: You speak of the minuteness of your article on Henry G. Pearson in the *Nation* of this date. Forgive me for saying it is not nearly minute enough, because it fails to set forth in detail the manner in which "he was left to struggle and perish." Pray resume the subject, and tell us all you know about it, for you will thus render a service not only to your immediate readers, but to the whole country that is still waiting to be trained in civil-service reform. SAMUEL ELIOT.

BOSTON, April 25, 1889.

[Our knowledge of Mr. Pearson's trials was in large part communicated to us orally by himself. To reproduce them in detail would require access to his correspondence, official and private. Even if we had this now, it would hardly do to anticipate the memorial of his life and services which we trust his family will some day give to the public. It is a duty which we hope his father-in-law, Mr. James, and his widow will not neglect. —ED. NATION.]

Notes.

A SECOND series of papers by Sir John Lubbock, entitled 'Pleasures of Life,' and a new volume, 'London Life, and Other Stories,' by Henry James, will be published directly by Macmillan & Co.

Houghton, Mifflin & Co. have ready for immediate publication 'The Beginnings of New England: The Puritan Theocracy in its Relations to Civil and Religious Liberty,' by John Fiske; 'Washington as a Statesman,' in two volumes of the "American Statesmen" series, by Henry Cabot Lodge; and 'The Cup of Youth,' a new volume of poems by Dr. S. Weir Mitchell.

Longmans, Green & Co. will shortly publish the life of C. B. Vignoles, an English civil engineer who was assistant surveyor in South Carolina in 1817-20, and who surveyed and mapped Florida a little later. He aided Ericsson in building the *Novelty* as a rival to Stephenson's *Rocket*, and he became one of the foremost of English railway engineers.

Ginn & Co. have in preparation for their "Classics for Children" series 'Heroic Ballads and Poems,' and 'The Two Great Retreats of History,' viz., Xenophon's (in Grote's narrative) and Napoleon's from Moscow (as related by the Comte de Ségur).

Our countryman, Dr. L. H. Mills, 19 Norham Road, Oxford, England, is to issue by subscription his work on the Gâthas of Zoroaster, during the present year or early in 1890. The price of the book, delivered in the United States or Canada, is $7.50.

A new 'Deutsches Wörterbuch,' by Prof. Moriz Heyne, in three volumes, is about to be issued by S. Hirzel, Leipzig (New York: F. W. Christern). It will be more handy and less discursive than Grimm or Sanders, and proposes to itself to fill the place of Webster in English lexicography. It has been ten years in preparation.

Alphonse Daudet's 'Recollections of a Literary Man' ('Souvenirs d'un Homme des Lettres'), translated by Laura Ensor, and published by George Routledge & Sons, is a collection of pieces of which, we think, none are new, and most are from ten to twenty years old. There are sketches of Ollivier and Gambetta, both very slight, and of various actors and actresses, still slighter in texture; some account of the genesis of 'Numa Roumestan' and 'Les Rois en Exil'; some war sketches; and an account of a morning reading at Edmond de Goncourt's, which is much the best thing in the book. But there is nothing in it that seems to us nearly so good as the best parts of 'Trente ans de Paris,' and especially nothing to approach the immortal history of that first dress-coat. Nevertheless, the reader is permitted to see, even in this volume, some of those traits of Alphonse Daudet which have made him to be loved by his friends even more than he is admired.

Under the punning title of 'La Divine Comédie . . . Française,' M. Maxime Boucheron has recently published (Paris: Librairie Illustrée; New York: F. W. Christern) a lively little book about the Théâtre-Français, its organization and its artists. It is gossip set down by a writer not without the critical faculty; and it has scattered through its pages a host of amusing little cuts, most of them with a taste of not unkindly caricature.

'In Memory of John McCullough' is the title of a thin volume recently printed by the De Vinne Press in an edition of 500 copies. It contains a sketch of the actor's career and character by Mr. William Winter, who contributes also two poems. The funeral oration of Mr. Harry Edwards, the address of Mr. W. F. Johnson, and the oration of Mr. Steele Mackaye at the dedication of the monument are also included. There is a photogravure from life for a frontispiece. Altogether, the volume is a worthy and dignified memorial of an actor of high ambition and strenuous endeavor.

A very neatly printed volume contains five 'Short Comedies for Amateur Players,' adapted and arranged by Mrs. Burton Harrison (De Witt Publishing House). It is to be regretted that the titles of the French originals are never given, and the names of the French authors only once. The proof of the amateur play is in the acting; and these little pieces have been repeatedly performed by the amateur players of New York and elsewhere. Quite the best of them is "Weeping Wives." As there has been no attempt to localize its story, the duel which unties the knot at the end of the play is quite natural, while that supposed to take place in New York in "Tea at Four o'Clock" is not.

Mr. Charles Thomas Jacobi has followed his 'Printer's Handbook' with 'The Printer's Vocabulary' (London: The Chiswick Press), which he declares to be a collection of some 2,500 technical terms mostly relating to letter-press printing, "many of which have been in use since the time of Caxton." Mr. Jacobi's book lacks the pleasant literary flavor of M. Boutmy's 'Dictionnaire de la Langue Verte Typographique,' and it is British and insular to the last degree. We find, for example, the absurd word *forme*, which seems to be the new-fangled English fashion of spelling *form*. We understand that Mr. Theodore L. De Vinne has revised and set in order the printer's vocabulary for the new 'Century Dictionary.'

That there is not honor among thieves is well known, and it is equally indisputable that piracy leads to cutthroat competition. The latest instance of this is to be seen in England, where the shilling reprint of 'John Ward, Preacher,' issued by F. Warne & Co., has been followed up by a sixpenny reprint issued by Ward, Lock & Tyler. As a rule, the British pirate, if less numerous than his American fellow-craftsmen, is also less scrupulous; but Messrs. Warne & Co. followed an American precedent, and acknowledged the author's moral rights, by sending a check to Mrs. Deland, who promptly forwarded it to Messrs. Longmans, Green & Co., the authorized English publishers of 'John Ward, Preacher,' requesting that they send it back at once to Warne & Co.

It is several years since we noticed among the American novels of the day 'Divorce,' by Margaret Lee. A new edition of it comes to us from Frank F. Lovell & Co., and is accounted for by a laudatory notice of it by Mr. Gladstone in the *Nineteenth Century* for February last. Mr. Gladstone even prompted an English edition. Nothing is more curious than the rôle which European statesmen now play as promoters of the fortunes of books—Mr. Gladstone in particular, and Bismarck also, as in the case of the 'Buchholz Family.' We have in vain asked ourselves what American statesman could send people in shoals to the circulating library for a work of fiction, or would be thought a competent critic in belles-lettres. By this remark we intend nothing disparaging. We remember once to have had our literary censure controverted by a Philadelphian, on the ground of the favorable opinion entertained of the book in question by the late Mr. Horace Binney. This seemed to us then a note of provincialism, the book not being in the line in which Mr. Binney had won a very enviable distinction.

The only fault we have to find with the guide-book called 'The New Jersey Coast and Pines' (Short Hills, N. J.: Gustav Kobbé) is, that it stops short, so far as the coast is concerned, with Atlantic City, leaving the reach from that point to Cape May without a chronicle. But this lower portion is rather in the province of Philadelphia than of New York, Mr. Kobbé's point of departure. The little book has been carefully prepared from personal visitation and from historical research, and is very interesting reading. Its road-maps are based on the great Atlas of the State Geological Survey. There are a number of "process" illustrations, which we could wish the success of the guide-book might some day replace with photographic views. In fact, an interleaved edition, to accommodate local scenes caught by amateurs with the camera, would, we think, prove to be very taking.

Houghton, Mifflin & Co.'s 'Satchel Guide for the Vacation Tourist in Europe' anticipates its twentieth edition by a fresh rewriting and resetting in smaller type, so that a good deal more matter is contained in about the same number of pages as heretofore. It has cover-pocket maps of London and the British Isles, besides folding maps of Paris, Switzerland, Holland, etc., stitched in.

Prof. J. H. Chapin's 'From Japan to Granada' (Putnams), a collection of notes made in a tour round the world, seems to have been suggested as much by the author's previous reading as by his actual view of the places described, except in the frequent references to the geological phenomena of the countries visited. It lacks that outdoor freshness which ought by nature to belong to a traveller's sketches. The threshing of old straw continues through three hundred and twenty-five pages, and pitiful indeed is the grain to be garnered at the end. The heavy and monotonous pages are seldom relieved even by a quotation. Still, the author insists that his book is "not intended in any sense as a substitute for the guide-book." In the title-chapter on Japan, despite the voluminous library containing fairly accurate information which the author

might have consulted while correcting proofs, as he certainly read widely and uncritically before writing himself, we find a swarm of errors. Fugiyama, Yeddo, Yezzo, *hari-kari*, Keigé, instead of Fujiyama, Yedo, Yezo, harakiri, Keiki, are bad enough, as is *habisha* for *hibachi*. Concerning the death of Mr. Richardson, an Englishman, whom Prof. Chapin speaks of as "an American citizen," the facts are better known than he imagines, as a dozen volumes will testify. The story told about the pony on page 43 shows how easily travellers are taken in by local guides, especially when pullers of *jin-riki-sha* act as ciceroni. A chance bit of geological information will here and there reward "the kind reader," to whom the author bids farewell from the Washington Irving hotel in Granada, on his closing page.

Dr. J. S. Sterrett sends us the 'Leaflets from the Notebook of an Archæological Traveller in Asia Minor,' published as a pamphlet by the University of Texas. They are jottings of the experiences of himself and others in getting at and transcribing inscriptions in the land of the "unspeakable Turk," extremely interesting in themselves, and told in a manner that well sets forth the romantic side of archæological field work.

The centenary of the Republic, now being celebrated in this city, is attested by a number of publications on our table, beginning with the Catalogue of the Loan Collection of Portraits, Relics, and Silverware at the Metropolitan Opera-house—a surprisingly large exhibit, particularly in the line of Washington portraits. The "Nugget Series" of the Messrs. Putnam makes a pretty volume, in large print, of the Declaration, the Constitution, Washington's inaugurals and Farewell Address, Lincoln's inaugurals and Gettysburg Address, an appendix by Paul Leicester Ford, and an index to the Constitution. The portraits of the two Presidents do not enhance the attractiveness of the setting of these 'Ideals of the Republic,' as the publishers choose to call the collection. Mr. Frederick Saunders of the Astor Library has issued 'The Washington Centennial Souvenir' (Thomas Whittaker), a "little garland of graceful and enthusiastic utterances of eminent personages from all nationalities, in honor of the Founder of the Republic." It is a good-sized string of his own, however, with which Mr. Saunders connects other men's posies. The pamphlet is illustrated in a quaint way. Mr. Benson J. Lossing prolongs his 'Pictorial Field-Book of the Revolution' in 'Hours with the Living Men and Women of the Revolution' (Funk & Wagnalls)—an illustrated pilgrimage of forty years ago. The last chapter is on Alexander Anderson, the father of American wood-engraving. 'Uncle Sam's Diary of a Hundred Years' (A. M. Ernsberger) is a somewhat crude pocket medley of history and statistics, which celebrates all the Presidents and ladies of the White House with portraits, gives an account of the several administrations, borrows a map or two from the Census of 1880, serves as a guide to New York, etc., etc.

The Albertype Co., 58 Reade St., send us the most appropriate souvenir of the centenary fête of the present week—a very large albertype print of Ward's statue of Washington before the Sub-Treasury on Wall St. The view is directly in front, showing most clearly the pedestal with its inscription, the image (nine and a half inches high), and the flanking columns of the portico.

Sun and Shade for April (Photo-Gravure Co.) is invested with a sad interest by reason of its views of the three American men-of-war lost at Samoa. For the rest, this monthly issue has the usual variety of photographic prints, including a Washington portrait, to be in the fashion.

The Ethnography of Macedonia and Old Servia is the subject of a paper in *Petermann's Mitteilungen* for March, illustrated by a map so colored as to show the position and extent of the various nationalities. It is the result of investigations made for the purpose of demonstrating the injustice of the claims of Servia upon this territory. To the writer's great surprise, he found that "the majority of the Slavs inhabiting Macedonia are not of Bulgarian but of Servian descent." His proofs are drawn from an examination of their language, customs, dress, songs, history, and origin. He estimates the whole population at nearly three millions, of whom almost two-thirds are Serbs, while the Bulgars number only 176,200 and the Greeks 171,200. Other interesting statistics are given as to the religion and political proclivities of the people, the Turkish party far outnumbering the aggregate of the others, and the Greek coming next in importance. This is followed by an interesting description of an ascent of Kilima-njaro by Otto E. Ehlers in November, 1888. The greater part of the way he was accompanied by an American naturalist, Dr. Abbott, who was hunting and collecting in the region at the base of the mountain. Herr Ehlers with great difficulty climbed to the top of the ice-wall upon the summit, but could discover no signs of a crater. At a height of over 15,000 feet he found traces of elephants, buffaloes, and antelopes in the snow. At this same elevation was the last vegetation, a species of everlasting (*Strohblume*).

The most interesting paper in the April Proceedings of the Royal Geographical Society is on Formosa, by Mr. Geo. Taylor of the Chinese Customs Service, in which he has gathered an unusual amount of information on the customs and folk-lore of the aboriginal inhabitants, whom he divides into four races. The earliest settlers, the Paiwans, have retired to the inaccessible mountains of the interior. They are inveterate head-hunters, some tribes using the heads "as public offerings at seed-time and harvest, and yet others bury the heads, erecting over each a small stone tablet. Each year a counting of tablets takes place, and the village possessing the most is awarded a handsome prize." They, in common with the other aborigines, have the same custom which prevails in parts of Central Africa, of keeping in one large house the youths of the village from the time they attain puberty until married. If their quarrels, which arise on the slightest provocation, interfere with their agricultural work or their fishing, they "appoint a day and place and fight a pitched battle. About nightfall each side counts its killed and wounded, and the one that has the most declares itself vanquished and indemnifies the victors. Amicable intercourse follows, and the matter is considered at an end." A folk-lore story of a land-crab and a monkey, who assume human shapes in order to court a village girl, told by Mr. Taylor, is characterized by the same humor as those of our Southern negroes. The greater part of the original inhabitants are fast amalgamating with the Chinese and are losing their distinctive traits, even rivalling their conquerors in astuteness. "The Chinese have a proverb to the effect that, when the savages take to wearing trousers, there is no opening left for a Chinaman."

Miss Hapgood, writing from St. Petersburg under date of April 9, reminds us that the extract from Tolstoi recently taken by us from the *Week* (*Nedyéla*) is not new, but may be read in that author's 'Life' published here in her translation about a year ago. The thing to be noticed is, that 'Life' is officially interdicted in Russia, yet extracts from it are allowed to appear in the *Week*, and eventually subscribers to that journal will get nearly the whole book.

The American Library Association will hold its annual meeting at St. Louis on May 8–11, the Southern Hotel being headquarters. A river excursion to New Orleans is on the post-conference programme, with a return by way of Mobile, Atlanta, Nashville, the Mammoth Cave, and Cincinnati.

—Historical students will welcome a new and revised edition of President C. K. Adams's 'Manual of Historical Literature' (Harper & Bros.), which has been out of print for some time. The revision has consisted in bringing up to date the bibliographical details of works previously mentioned, in adding to the main lists, in revising the critical comments, and particularly in adding to the different sections name-lists containing some eight hundred titles of recent works. An examination of the new edition reveals that this last is its most valuable feature, and students are thereby placed under renewed obligations to the author. As is perhaps inevitable in a work of such detail, not all the new nor the best editions are mentioned, and some errors still remain in the critical comments. Michelet is still described as a "monarchist and a Roman Catholic," which would have made him "stare and gasp." We had hoped to see the unworthy fling at Von Holst omitted from future editions, but it still remains as a mortification to all Americans who appreciate the German scholar's services to American history. We feel sure that Dr. Adams does not realize how it sounds. A somewhat fuller treatment of the History of Israel and of the Eastern Question would be desirable. To the works on the former should be added, at least, Wellhausen's 'Prolegomena,' Kittel's 'Geschichte der Hebräer,' and Schrader's 'Die Keilinschriften und das Alte Testament,' and either Hausrath or Schürer on the New Testament times. On the Eastern Question we miss Laveleye's 'Balkan Peninsula' and Minchin's 'Growth of Freedom in the Balkan Peninsula.' On French literature, Saintsbury is not mentioned. Probyn's 'Italy from 1815-78' should have been included. But the most puzzling omission is that of Prof. Tuttle's 'History of Prussia,' a work issuing from Cornell itself. In the classification, Creighton's 'History of the Papacy' should be under Italian, and not English history. Under recent works of importance on Spain is the entry: "B. de Sahagun's Histoire Générale des Choses de la Nouvelle Espagne, Paris, 1800 [read 1880], a work of originality and ability"—an instance in which Dr. Adams has probably relied on some undiscriminating assistant. Two pages before this, it seemed incongruous to find: "Crawfurd's Portugal is a recent book, combining description and history in an agreeable manner. Cervantes's view of Spanish manners has the high endorsement of Prescott." In works of this kind it is the hard fortune of the author to be exposed to error almost in proportion to the efforts he makes to be helpful. The more titles he gives, the more particulars about the works, the greater are the opportunities for slight errors to creep in. Consequently, such works should be judged by what they give us more than by what they fail to supply. Judged by this standard, President Adams's Manual deserves a renewed and even more grateful reception from students of history.

—In the work of the societies for the prosecution of psychical research, the study of fraud and of self-illusion proceeds *pari passu* with

the study of the manifestation of mysterious forces. Now one and now the other seems to get the upper hand. The best evidence that the English society had for the existence of thought-transference came from certain daughters of a clergyman, and a servant-girl in the same family, who have since been found out to be plain impostors. As Professor Newcomb pointed out at the time, it was so improbable as to amount to an absolute impossibility that a power rare enough to have been detected not a dozen times in all should have descended upon the children *and the servant-girl* of a single family. But if the daughters of a clergyman can be so wicked as this, what confidence can one place in clergymen even? Is not any degree of unexpectedness in lying a far less extraordinary circumstance than would be the truth of telepathy? And, more than this, if simple girls can successfully deceive these investigators, how can one believe that the investigators are possessed of those rare powers of thought and of intuition combined which are essential to the detection of intricate cases of fraud? The President of the English Society, Professor Sidgwick, says, in his last address, that the special point of their investigation has been the care with which unconscious signalling has been excluded; but it looks as if that care were not yet quite sufficiently rigorous.

—It is nearly fatal to the rather strong evidence in favor of telepathic hallucinations at the moment of death, that evidence almost as strong has been collected in favor of premonitions. For to believe that one can receive intimation in a dream of an event that is to happen five years hence, is to throw away in a moment all the knowledge of nature that has been painfully acquired by the generations that have preceded us. But if these queer tales (which are admirably commented upon by Mrs. Sidgwick, in her report on the Evidence for Premonitions) are all capable of being explained by coincidence and illusions of memory, then these same hypotheses, by putting a little harder strain upon them, may suffice to account for the other cases also. One thing which is greatly in need of explanation is the fact that the existence of the Society seems to be causing the extinction of death-wraiths. Professor Sidgwick himself considers that the Society has now reached a crisis in its history; it was hoped that the publication of 'Phantasms of the Living' would result in securing a good number of fresh cases of spontaneous telepathy recorded in writing at the moment of their occurrence, and hence before there could be any knowledge of their appositeness. But such cases have not been forthcoming, and, "as time goes on, the absence of such evidence will constitute an argument of continually increasing strength against" the Society's conclusions. It is plain that a single case of an absolutely unimpeachable kind would be worth more than the volumes that have been published of evidence that is a little less than convincing. There is no kind or degree of illusion that the best of us may not at any moment be subject to, and the only thing that is impossible is that two people in different places should have the same illusion at the same moment. If the committee could obtain two written accounts of a single scene, one by a person who was present and one by a person who saw it telepathically, and if these accounts should be found to resemble each other closely—and if in addition it was absolutely certain that they were written without collusion—then, indeed, the question of telepathy would be put upon a different footing. What mystic is preparing himself to furnish the Society with this much-longed-for evidence?

—Early in the month of March, Dr. Dujardin-Beaumetz, the eminent director of the Hôpital Cochin, read before the Board of Health of the Department of the Seine his yearly report upon cases of hydrophobia occurring in the department during the year 1888. This report has since been published in the *Bulletin Médical*, and contains much interesting information and many statistics. It appears that nineteen persons died last year of rabies in the Department of the Seine. This number is relatively considerable if it be compared with the figure for the years 1880, 1883, 1884, and 1885, in each of which there were only three such deaths. But it is, on the other hand, a shadow less than the figures for 1881 and 1886, which are twenty-one and twenty-two respectively. Of the deaths in 1888 four were due to bites of cats, and sixteen to bites of dogs. In two of the cases there was, strictly speaking, no bite at all, the virus being conveyed by the tongue of the animal in licking. The period of incubation of the disease was in these nineteen cases from twenty-five to forty days. The longest of these is a much less period than has sometimes been observed, since incubation has been known to last 139, 143, and even 245 days. Of the reasons why these periods vary, nothing is certainly known. It is probable, however, that their duration may depend upon the number of wounds received, and the quantity of the virus, and also, perhaps, upon the situation of the wounds. Contrary to what is generally thought, the diagnosis of rabies is not a simple matter. In four out of the nineteen cases the doctors went entirely wrong. In one case the disease was held to be tetanus; in three others, angina, diabetes, and delirium tremens.

—The last half of M. Dujardin-Beaumetz's report is devoted to a consideration of the treatment of rabies by the method of M. Pasteur. In the year before last, 1887, there were 306 persons reported in Paris as bitten. Out of this number the madness of the biting animal was demonstrated by experiment, or testified to by veterinaries, in 263 cases. Out of the 306 cases three only were fatal. That puts the mortality at .97 for each 100, if all the cases are included; or at 1.14 for each 100 if only the cases in which the biting animal was surely mad be taken. The above 306 cases were treated by Pasteur's method. There were also reported during the same year 47 cases of persons bitten who did not receive treatment by inoculation. Out of these seven died. So that, in round numbers, it may be said that M. Pasteur can show a death-rate of only one in 100 among his patients as against a death-rate of sixteen in 100 of those treated by the old methods. The figures for last year, 1888, tell almost exactly the same story. During the year 385 persons were treated at the Institut Pasteur. In 105 of these cases the madness of the biting animal was demonstrated; in 231 it was testified to; while in regard of 49 there was no information. Out of these 385 persons 4 died, which equals 1.04 per cent of the whole number bitten, or 1.19 per cent. of those bitten by animals that were surely mad. During the same year 105 cases were reported of persons who did not receive inoculation. Of these 14, or 13.3 per cent., died. In reference to this death-rate among those not inoculated, it is interesting to note that it closely agrees with the rate of mortality in rabies—14 to 16 per cent.—set by Bronardel and Leblanc before the method of M. Pasteur came into use. It may also be noted that severe cases of wounds by biting are more likely to be taken to the Institut and slighter ones neglected. On the whole, then, it is to be said that any person who has been bitten by a mad animal has many more chances for his life if he submits to the treatment of M. Pasteur than if he neglects it.

—M. Dujardin-Beaumetz ends his report by recommending a measure of precaution. The number of rabid animals reported in Paris increases every year. It has grown by a regular and large increment each year from 182 in 1883 to 863 in 1888. Even these figures are much within the actual number, for many such animals escape, or are not noticed and reported. The number of persons bitten is, of course, in direct proportion to the number of rabid animals, and this naturally suggests restriction of such animals as are most liable to madness from going at large. Last year, on the 8th of June, an order was published forbidding for the space of six weeks dogs to appear in the streets of Paris unless they were held in leash. The effect of this order was immediately apparent. Cases of rabies diminished in number so rapidly that for a while the Institut Pasteur almost found its occupation gone. This order was kept in force till the 1st of November, but was not thereafter renewed. Almost at once the old condition of things came back again. M. Dujardin-Beaumetz urges that this, or some more stringent regulation, shall be again put in force, and points out that in Berlin, where rigorous and persistent measures to stamp out the disease have been taken, rabies has almost, or quite, disappeared from the mortuary lists.

—The black and yellow fogs which are commonly associated with the weather of London and some other English towns have been made the subject of considerable investigation during the last few years. It is now known that these are largely the result of smoke; the black or darker variety being almost entirely so, according to the dictum of Sir Douglas Galton. Those on this side of the Atlantic who look upon London as an exceptionally healthy city —as perhaps the healthiest large town in the world—will probably be surprised to learn that these fogs are highly deleterious to health, and that the death-rate in the towns rapidly increases during the season of their prevalence. But this fact is rendered intelligible when account is taken of the quantity of carbonic acid that is thrown into the atmosphere—and retained there during heavy weather—as the result of soot-combustion. Dr. W. J. Russell found a few years ago that on a single day this quantity had increased to more than three and a half times the average amount present in the atmosphere. The question naturally suggests itself, How healthy would London be without the fogs, or to what extent is the mortality-rate diminished by special habits of its citizens? In an interesting paper recently published by Mr. Hargreaves Raffles, the author gives some curious statistical facts regarding the London fogs. It was found that during the 152 days which were comprised in the months of November and December, 1887, and January, February, and March, 1888, neither Christ Church, Lancaster Gate, nor St. Mary Abbot's Church, Kensington, was once seen from Primrose Hill, although the distance of removal was only two and three miles respectively. The same was true of the Clock Tower of the Houses of Parliament, the Scotch Church, Regent's Square, and St. Paul's Cathedral, along other lines of vision, at distances of three, one and three-quarters, and three and a quarter miles respectively. On nine days included within the same period objects were not visible at a distance of over one hundred yards, while on four days the limit of vision was fixed

at five yards. The records of the Gas Light and Coke Company show that between the 16th and 24th of November, 1887, not less than 710,251,000 cubic feet of gas, representing the carbonization of 71,000 tons of coal, were distributed, for which the public paid at the rate of £490 per hour.

PROFIT-SHARING.

Profit-Sharing between Employer and Employee: A Study in the Evolution of the Wages System. By Nicholas Paine Gilman. Boston: Houghton, Mifflin & Co. 1889.

MR. GILMAN has done a very good turn, both to workmen and employers, by putting into a compact and very readable form the results, up to the present, of the experiments made in various countries in the matter of sharing profits with laborers as an addition to their wages. The information he furnishes has hitherto been scattered through a considerable number of books and periodicals, most of them in French or German, and not readily accessible to the general reader. He shows the extent to which profit-sharing has been tried in agriculture, in fisheries, and in a great many other industries, and summarizes the whole in a very interesting table. From this it appears that it has been tried and has failed, or has for some reason been discontinued, in thirty-six cases in various kinds of industry. On the other hand, it has been tried, and is now in more or less successful operation, in 137 cases in this and other countries. Of course, in nearly every case of success there is a different mode, as well as different rate of division, but the object aimed at and the results attained are very much the same. A share in the profits in addition to wages results, on Mr. Gilman's showing, wherever the system has succeeded, in securing greater diligence and fidelity and economy on the part of the workmen, and consequently a larger quantity or better quality of the product, and, what is of more value than anything else, a friendlier feeling on the part of the employed towards the employer, and a more complete identification of their interests.

The causes assigned for the thirty-six failures are instructive. In twenty-five cases the failure was due to some sort of shortcoming or misconduct on the part of the men. Either the payment of the bonus failed to increase the quantity or improve the quality of the product, or it failed to improve the relations of the employers and the workmen, or was, after trial, despised and rejected by the workmen, or produced on their part undue interference with the conduct of the business. Corresponding explanations with regard to the successful cases Mr. Gilman does not give, but the stress he lays all through the book on the importance of faith and good-will and humanity on the part of the employer, points to the conclusion that in most if not all of these cases there has been in the concern some man of great force of character, and of dominating importance to the business, who has in a measure imposed the system on his partners and on the workmen, and has watched the working of the experiment with something like paternal interest. Even under these conditions, however, as Mr. Gilman admits, complete success is hardly attainable without a high degree of responsive intelligence on the part of the workmen. In a curious exhortation which he addresses at the close to employers and employed respectively, he recommends the system only in part on business grounds. He advises employers to try it, because it will give them better profits, but also because, in trying it, "they will be doing a man's part towards a rational solution of existing troubles," and because, if they succeed, it will give them, besides profits, "the consciousness of having helped mankind nearer to the kingdom of God." He urges newspaper editors to take the matter up, because "the facts and arguments of profit-sharing have a novelty, interest, and value which entitle them to the widest dissemination and discussion." He appeals to the clergy of all denominations to preach profit-sharing, as a means of procuring "industrial peace," and abating class selfishness, and "socializing Christianity."

Mr. Gilman is very careful to guard himself against the charge of formally offering profit-sharing as a solution of the "labor problem"; and yet it is easy to see that he has not rid his own mind of the notion that it is in this way the discontent of the laboring class is to be met. He says: "The wages of the laboring class have undoubtedly risen steadily within the last fifty years, but they have not kept pace with the demands, just or unjust, of those who have labor to sell. The constant cry is for higher wages and fewer hours of work." This is all true, but the force of the observation lies in the application of it. It is quite evident that he reminds us of this with the view of showing that profit-sharing is one way out of the difficulty. There is no doubt that it is an excellent thing for both employers and employees to try, and for clergymen to preach, and that a general determination to try it would have an ameliorating effect on the condition of a certain number of laborers. But to suppose that it would solve "the labor problem" is to mistake the nature of the labor problem.

The labor problem is now, and has always been, not how to reconcile labor and capital, but how to make the earth support its rapidly growing population—a population which everywhere closely follows up all improvements in the means of production, and follows them up with increased demands in the way of comfort. No way of dividing the product will ever greatly, or for any great length of time, produce content as long as new-comers are constantly pressing for a share, not on the best possible terms, but on any terms. No matter how many laborers you cover with profit-sharing, there is soon a very large body without the gates who start the labor problem afresh, and are eager to have it solved at once, so far as they are concerned—not in the way that will most hasten the Kingdom of God, but in the way which will most speedily put them in possession of food and clothing; and that way is the receipt of fixed wages. If laborers were a fixed, or even a slowly increasing quantity, there would, with no improved powers of production, be but little difficulty in satisfying even their unreasonable desires. What makes all the industrial trouble is, that wherever they collect in masses, their number soon surpasses the demand for them, and if some are maintained in a high degree of comfort, others must live in a corresponding degree of penury. This is the labor problem in London, in Paris, in New York, in Chicago, and in every place else in which there is much writing or preaching about it. Coöperation and profit-sharing are both devices simply for putting a small minority of the laborers, of unusual intelligence and self-restraint, into the category of capitalists. They do not provide for the surplus of labor which is sure to flow to every place in which large masses of capital have accumulated and are seeking investment.

Nor does Mr. Gilman take into sufficient account the fact, which he does not conceal, that his examples of successful profit-sharing are all drawn from prosperous concerns, while the truth is, that the majority of concerns are not prosperous. It has been said that ninety-five per cent. of those who go into business as employers of labor fail. If this be an exaggeration, it is certainly not an exaggeration to say, as M. Levasseur does, that ten per cent. succeed, fifty "vegetate," and forty go into bankruptcy. The reason of this is obvious, and is very concisely stated by Mr. Gilman himself, viz., "executive talent is one of the rarest of human endowments." Consequently it may be said that in ninety cases out of a hundred there would be no profits to share, and the experiment would be abandoned in disgust by the workmen in the first or second year. To sum up: Profit-sharers among workingmen, like coöperators, will always be a sort of *corps d'élite*—an aristocracy, that is to say, of talent and character, whose condition will have no perceptible effect on the "labor question," but whose numbers, nevertheless, every lover of his kind must wish to see increase. We can no more by profit-sharing escape the working of the law of population on subsistence than we can by taking thought add one cubit to our stature.

THE LAST WAR IN AFGHANISTAN.

The Life and Opinions of Major-General Sir Charles Metcalfe Macgregor, K.C.B., C.S.I., C.I.E., Quartermaster-General in India. Edited by Lady Macgregor. 2 vols. London: Blackwood & Sons. 1888.

ALL who like to read of deeds of personal daring will find ample store of such in the early military life of Sir Charles Macgregor. That degree of courage which will carry a man without discredit through the incidents of a battle is common enough; not so the absolute fearlessness which was the great distinguishing characteristic of Macgregor. In the commerce of ordinary life, silent, reserved, almost repellent in his manners, the approach of danger had the effect of transforming him into a genial and joyous companion. He seems to have positively relished danger. "He was," says an early comrade, "the only man I ever met in actual service who really liked fighting." He sought out occasions of single combat with as great an eagerness as a knight of the Middle Ages. To lead a handful of irregular cavalry against desperate odds was the supreme delight of his young days.

There are, however, many excellent fighting soldiers who, except in the midst of battle, are good for very little. Sir Charles Macgregor did not come under this category. He was an indefatigable student of his profession in the widest sense—diligent in all knowledge which can be extracted from books, and even more diligent in that knowledge which comes from a careful study of the actual ground on which campaigns have been or are likely to be fought. Thus it was that, while yet quite a young man, he ranked second to none in the British Army in India as a soldier of knowledge, experience, and judgment. He had paid especial attention to the advance of Russia in Central Asia towards the Himalayan frontier of India. Over a large part of the country traversed or still to be crossed, he had himself travelled, and he, perhaps more than any of his contemporaries, has given shape and direction to the Afghanistan policy pursued by the Indian Government from the Viceroyalty of Lord Lytton down to that of Lord Dufferin. It is on this account that the publication of his 'Life and Opinions' possesses an interest and importance greater than

could belong to the mere story of a brilliant and daring soldier. It lifts the veil, so to speak, from the inner history of Lord Lytton's abortive invasion of Afghanistan, and shows—though this is far from Lady Macgregor's intention—how blindly and completely the Indian Government has been playing, at immense cost, the game of Russia, if it be true that that Power meditates an invasion of India.

British India is governed by a Viceroy, who, of necessity, knows nothing of the people or the country until he begins to govern them. He is assisted by five officials—Members of Council—who are not chosen for this duty for reasons of exceptional fitness, but merely arrive at it by way of seniority. The supreme difficulty which affects this singular government is that of "getting into touch" with the people. And to make this difficulty as great as possible, it is the practice of the Supreme Government to migrate for six months of every year out of India altogether to Simlah—a station lying deep in the folds of the Himalayan Mountains. This also is the headquarters of the Commander-in-Chief. Here, if we except the writers and native clerks in the Government offices, there are no natives to trouble the serenity of the high official world. Simlah is the chief resort of all the pleasure-seekers and office-seekers of British India. Every one who can get a few days' leave from the burning heat of the plains hurries thither. All the pretty women, with or without their husbands, are eager to partake of the sunshine of the Viceregal presence, to dance at the balls and eat of the dinners of Viceroyalty. And for six months of every year, what is officially described as "the Government of India" is carried on in the midst of a saturnalia of balls, picnics, lawn-tennis tournaments, social scandals, and a ceaseless babel of gossip. It is needless to say that India is not really governed from Simlah. The Government would go on without any appreciable shock to its existence if Simlah and all its inhabitants were to be suddenly transferred to another planet. What actually proceed from Simlah are the great schemes of conquest, the wars and annexations, for which India has to pay. Russophobia was hatched in Simlah so far back as 1838, prior to the first war in Afghanistan; and to Russophobia in Simlah belongs the credit of hatching and nursing into maturity the second war also.

Among the Anglo-Indian Russophobists, none of his day took the disease in a more acute form than Sir Charles Macgregor. The great end and aim of an Anglo-Indian Russophobist is to precipitate a collision between Great Britain and Russia in the desert of Central Asia, and the case of Sir Charles Macgregor is instructive as showing how a man is brought into this peculiar condition of mind. Macgregor was a soldier to the backbone. Military glory was that which he valued beyond everything else in the world. In India itself he saw, or thought that he saw, that opportunities no longer existed for the winning of such a fame as he coveted. He longed for a larger field, a more worthy adversary, and discovered both in the rapid advance of Russia in Central Asia. Macgregor was unquestionably sincere when he urged the Indian Government to cross the deserts of Afghanistan and attack Russia in her own territories; none the less was the wish the father to the thought. In the event of such an enterprise being undertaken, Macgregor was himself certain of employment in a war such as he had dreamed of and longed for all his life; and it is impossible to read his biography without feeling that his passion for military distinction had gone far to warp and pervert his military judgment. When war broke out between Russia and the Ottoman Empire, consequent on the massacres in Bulgaria, Sir Frederick Roberts (the present Commander-in-Chief in India) was at the head of the Quartermaster-General's department, with Colonel Macgregor as his assistant. Under their joint auspices a plan of campaign was drawn up, to be carried into effect if Great Britain (as all Simlah society hoped and expected) took the field in order to repeat, as the ally of the Turks, the monstrous insanity of the Crimean war. The object of this plan, as stated by the authors, was to "checkmate the advances of Russia on the north of Persia, the northwest frontier of Afghanistan, and in Central Asia," and the way in which all this was to be accomplished was by taking possession of Afghanistan, driving out the reigning family, and sending a British force right through Afghanistan—a march of 900 miles across a desert and unpeopled country—to occupy Herat as a base of offensive operations against Russia.

This plan was really quite as impracticable as a scheme for the occupation of the moon. Nevertheless, on the strength of it, a quarrel was literally forced upon the unfortunate Amir Shere Ali, and three divisions of British troops, under the command of General Donald Stewart, were started from Moultan in the forlorn hope of getting to Herat somehow. Although they encountered no resistance, the impossibility of finding food for their baggage animals destroyed the mobility of these divisions by the time they got to Kandahar. They lost thirty thousand camels on the march. The animals which survived were too much exhausted to proceed further. Food for so large a force could not be found in and around Kandahar; and, after existing for a time on half rations, one-half had to be sent hastily back to India in order to keep the other half alive. This unmitigated failure left the Viceroy, Lord Lytton, and his advisers without either plan or policy in Afghanistan, except to get out of the country with as little ignominy as possible; and although the war was prolonged for more than a year after the first occupation of Kandahar, the British operations, from first to last, were governed by no higher object than to obtain a decent excuse for getting away without a public confession of failure. Macgregor acted as chief of staff to Sir Frederick Roberts when that officer marched to Kabul after the attack on the British Residency and the slaughter of Sir Louis Cavagnari and his escort. He was, therefore, behind the scenes all along, and has recorded his experiences in a diary kept from day to day. Lady Macgregor, as in duty bound, has very severely "edited" this diary before giving it to the world, but enough remains to show that, in the records of human folly, England's last war in Afghanistan will always retain a very distinguished place.

Macgregor survived the war only a few years. As a soldier in the field, he had, in the course of it, exhibited the courage and capacity which characterized his military career throughout, but—and this certainly is strange—he lived to the end of his life a Russophobist. Almost his last work was to draw up an elaborate statement on "The Defence of India" against an inevitable Russian invasion. This is too minute and technical to be discussed in a notice of the author's life; but one statement may be noticed. The second war in Afghanistan demonstrated, as, in truth, the first had already done, that it is impossible to move large masses of troops in Afghanistan. The impossibility is occasioned by the total want of forage for the baggage animals within any measurable area of country. Camels, which must constitute the greater part of the transport of troops operating in Afghanistan, need, if they are to be kept alive, to graze at large; but when, about sunset, the encamping ground is reached, and the animals unloaded, how is it possible to allow thirty thousand camels to graze at large in a desert country, with gangs of thieves ever on the watch to snatch up unconsidered trifles? The thing is impossible; consequently the British camels in Afghanistan marched all day and starved all night, and died by tens of thousands. Oblivious of this circumstance, Sir Charles Macgregor, in his "Defence of India," assumes that Russia, when she delivers her attack, will enter Afghanistan, in three columns of the collective strength of 95,000 men! That means, at a moderate calculation, two hundred thousand camels. If Russia attempted anything so wild as this, it is needless to say that the whole army, men and animals alike, would infallibly be starved to death long before they reached the heads of the Khaibar and Bolan passes.

The Life of Young Sir Henry Vane, Governor of Massachusetts Bay and Leader of the Long Parliament, with a Consideration of the English Commonwealth as a Forecast of America. By James K. Hosmer, Professor in Washington University, St. Louis, etc. Boston: Houghton, Mifflin & Co. 8vo, pp. 588.

"THE English Commonwealth as a forecast of America"—in these words lies the key to Prof. Hosmer's life of Vane. It is not a mere biography, but is written with a purpose; and if the reader of its pages is sometimes tempted to think that the American bearings of Vane's career are insisted upon overmuch, and are sometimes a little far-fetched, the closing chapter, "Why the Story of Vane is Timely," sets this all right. Mr. Lowell said to M. Guizot (p. 561) that the American Republic "will last just so long as the traditions of the men of English descent who founded it are dominant there." Wiser and more pregnant words could not have been uttered; and the book before us is a weighty contribution to this result—that the traditions of our English ancestors shall continue dominant among us.

How can this be done better, we are asked, "than by setting forth the career of some one great man, if such a one can be found, who was at once an Englishman and an American?" Such a figure was Sir Henry Vane the younger:

"We have seen him begin his public career in 1636 as a citizen of Massachusetts, where, in the position of Governor, he fought stoutly against the other colonial magnates for a free toleration of all religious beliefs. Returned to England, we have seen him, at the outset of the Long Parliament, the chief reliance of Pym in bringing Strafford to destruction. In 1643 he brought the Scots to help the sinking cause of the Parliament. As much to him as to Cromwell was due the victory of Marston Moor, perhaps also the victory of Naseby—successes which in the Civil War turned the scale against the Stuart despotism. He was the heart of the Rump and the Council of State when Cromwell smote Ireland and won the fields of Dunbar and Worcester. He reorganized and administered the Navy when Van Tromp and De Ruyter were on the point of sweeping it from the seas—standing back of Blake when England won the empire of the deep, as the elder Pitt stood back of Wolfe and the younger Pitt back of Nelson. First of men, we have seen him, in 1656, recommend the expedient of a *Constitutional Convention*, that the *People*, after the American fashion, might lay down for themselves the 'fundamentals' of a proper polity" (p. 566).

Even if Vane's claims to recognition, as pre-

sented in this sketch, may be somewhat exaggerated, there are enough here of unquestioned services of the highest value to raise the question why he has fallen, as our author admits, into a degree of obscurity. Students, perhaps, would rank Vane, among the men of his age and party, next to Cromwell, Hampden, and Pym; but, to the majority of careless readers, his name probably hardly calls up any distinct memory or association. His activity, nevertheless, extended more than ten years after the deaths of Hampden and Pym, and he alone, of all men of equal eminence—unless we except Hampden's death upon the battle-field—stands by the side of Eliot as a martyr for his cause. Surely the heroic death upon Tower Hill should have guaranteed his memory against even the degree of oblivion into which it has fallen.

The cause, no doubt, of the measure of forgetfulness of which he has been the victim is twofold. While Pym and Hampden lived, Vane's youth placed him quite in their shadow; in the maturity of his years and powers it fell to him to cross the purposes of the man of destiny, and the growing recognition of Cromwell's greatness has made it appear that the Parliamentary leader who ventured to oppose him was, of course, in the wrong. At any rate, from this moment he withdrew into private life, and only emerged from it three years later (1656) to be thrown into confinement by the dictator. Perhaps we can see, at the present day, the signs of a reaction from the exaggerated hero-worship of which Cromwell has been the object since Carlyle's collection of his letters and speeches. Recent scholars have pointed out serious flaws in Carlyle's work, resulting from his overweening admiration of power and success, and exhibiting an astonishing lack of critical acumen and historical accuracy. For our part, we are profoundly convinced that if Cromwell made mistakes, it was chiefly in those points in which he differed from Vane. There is no more melancholy chapter of failures in history than Cromwell's fruitless efforts to establish a form of free government in England after the fatal act of the dismissal of the Rump by the armed hand.

The first step in this direction, the exclusion of the eleven members—an act as lawless and unjustifiable as King Charles's attempt to seize the five members—is passed over by Mr. Hosmer with only a brief paragraph (p. 269), and with no comment upon its policy and no intimation as to whether Vane opposed it, as he did Pride's Purge and the dismissal of the Rump. But this was the act of violence that began the series of acts by which the military authority finally placed itself above the civil.

We cannot agree with Mr. Hosmer that the act of attainder by which Strafford was punished "was just, since Parliament could make laws for every case" (p. 131). Of course Parliament had the *power* to "make laws for every case," but that does not make a procedure *just* which sets at naught all the safeguards of the English law, and deprives a man of life without calling upon the judgment of his peers. With good reason the American Constitution has prohibited this iniquitous procedure; and we cannot think that anything in the long run was gained, in Strafford's case, by substituting this for the more equitable procedure of impeachment. On the other hand, we agree on the whole with Prof. Hosmer in his defence of Vane against the accusation of dissimulation. Like an even greater man, against whom the same charge is made, William of Orange, he had to deal with unscrupulous antagonists, with whom it was a first principle that they were under no obligation to keep faith with their opponents. Both of these distinguished men showed themselves "wise as serpents," a match for their antagonists in astuteness and the use of devious methods. We do not assert that they never went beyond what was right and justifiable in this; but their shrewdness and sagacity as men of the world were qualities needed at the time, and implied no moral obliquity.

The chapters which touch upon Vane's religious beliefs are very valuable. Clear-headed and sagacious in political matters, he is shown to have been visionary in questions of religion. Especially after he was forced from public life, his mind, in retirement, found employment in religious speculation, and occupied itself with those theories, so popular at the time, which seemed to undermine the foundations of society. Here may perhaps be found one cause of his separation from Cromwell.

The book is a thick one, and its dimensions are in great part due to its being not merely a life of Vane, but a history of the times. But this is generally justified by the plan of the work; and certain chapters, which seem almost digressions, are shown to be necessary parts of the author's theme—the development of the English Constitution upon American lines, under the influence of this Massachusetts Governor. The volume is handsomely printed, with an index, a portrait of Vane, plans of Marston Moor and Naseby, and a copy of the great seal of the Commonwealth. The personal reminiscences of the author, in visits to Edgehill, Marston Moor, Naseby, and Raby Castle, add greatly to the interest of the book.

The Philobiblon of Richard de Bury, Bishop of Durham and Chancellor of Edward III. Edited and translated by Ernest C. Thomas, Barrister-at-Law, late Scholar of Trinity College, Oxford, and Librarian of the Oxford Union. Lockwood & Coombes. 1889.

It is singular that so early and interesting a monument of English literature as the 'Philobiblon' of De Bury should have waited until this late date for proper editing. It was written in 1344, and was sufficiently popular to be many times copied, so that at present no less than thirty-five manuscripts of it are known. The first edition was printed at Spires in 1483; but no English edition appeared until 1598–99, and no English translation until that of Inglis in 1832. Paris gave us the first critical text as late as 1856. The present editor, however, having examined nearly all the manuscripts, is obliged to discredit both the Paris edition and Inglis's translation as being inadequate, and gives us the results of his own exhaustive labors in so beautiful a work of the bookmaker's art that we may well be content to accept this as the first standard issue of De Bury's celebrated essay on the love of books. He has established a Latin text, accompanied with full and careful notes of readings and interpretation, and added a translation, in excellent and fitting English, which retains the flavor of old books; and to these he has prefixed biographical and bibliographical introductions which leave nothing to be desired.

Richard de Bury belonged to that class of mediæval ecclesiastics who were more concerned with the State than the Church. At the first the tutor, he was afterwards the friend and counsellor of Edward III., and spent his life in works of diplomacy and government. He rose by the holding of great offices, and received his bishopric as a reward for political service. He himself admitted the superiority of the learned and pious Graystanes, who was elected to the see, and was forced to abandon it by the King's will and in accordance with the Pope's promise of the next vacant episcopal chair to De Bury; and on hearing of the death of his rival in retirement, being so much touched that he wished the messenger to withdraw, he is said to have answered his companions, "If you had known his worth as I do, I believe you would grieve as much as I; for he was fitter for the Papacy than I or any of my fellows for the smallest dignity in Holy Church." De Bury, however, had the redeeming grace of a love for scholars and learned men, with whom he surrounded himself, and he had a passion for collecting books, to which circumstance we owe his essay and he owes his fame. He lays down the principle that "no dearness of price ought to hinder a man from the buying of books, if he has the money that is demanded for them, unless it be to withstand the malice of the seller or to await a more favorable opportunity for buying." He had, too, unusual opportunities for collection in consequence of his high position at court and of his frequent travels on the Continent. He confides to the reader that "we were reported to burn with such desire for books, and especially old ones, that it was more easy for any man to gain our favor by means of books than of money"; and he adds, of those who employed this means, "In good-will we strove so to forward their affairs that gain accrued to them, while justice suffered no disparagement." One of the abbots of St. Albans bought favor in this way by presenting him with a Terence, Virgil, Quintilian, and Hieronymus against Rufinus, selling him besides thirty-two other volumes for fifty pounds of silver; but it is recorded that De Bury was smitten with conscience, and afterwards restored some of the books to the library, although he had carried out that other part of the contract which was not included in the pounds of silver. In one way and another he thus gathered his precious library, which he destined not for himself, but for Oxford. At the close of his life he drew up the rules for the custody and use of the collection, and it was as a sort of prologue to these regulations and commentary upon his gift that he wrote the brief essay which was his only literary work.

The treatise itself is entirely ecclesiastical in its Latinity, the style being described by the editor as, "like that of many among the mediæval writers, 'made of the Scripture.'" It is, nevertheless, very agreeable reading, and affords several piquant illustrations of the state of the clergy with respect to books. The description of the condemned brother who has fallen into evil courses, and is saved from impending punishment by proving his "benefit of clergy" by reading in the book, and that of the Oxford scholar who uses the precious volumes only to defile them by his uncleanly habits, are passages that will stick in any reader's memory; and the entire tract glows with the enthusiasm of the book-hunter. Paris was naturally a Mecca for the Bishop, but one is hardly prepared for such an outburst as that with which he greets the hearth of a then decaying scholasticism: "O Holy God of Gods in Sion, what a mighty stream of pleasure made glad our hearts whenever we had leisure to visit Paris, the paradise of the world, and to linger there!"—and this was a Paris without boulevards! That is a heartfelt prayer, too, which he puts up in the "Complaint of Books against Wars": "Almighty Author and Lover of peace, scatter the nations that delight in war, which is above all plagues injurious to books!" But the volume has already passed, even in the imperfect form in which we have hitherto possessed it, into the list of those half-dozen defences of books which, like the de-

fences of poetry, are fiery effusions of the literary passion.

But did De Bury write the essay that bears his name? There is a tradition that Robert Holkot was the author, doing it in De Bury's name and at his order, and in seven manuscripts it is ascribed to Holkot. This claim was formally put forth by Altamura and Echard on the authority of Laurentius Rignon and Lusitanus. The editor had decided that little weight was to be given to these authorities, a century later than De Bury and Holkot, or to the notes of the manuscripts, and he was disposed to conclude that Holkot, who was De Bury's chaplain, had at most the part of a secretary in the preparation of the work. He is forced to acknowledge, however, at the very end, that the question is made more doubtful by a passage which a friend has just brought to hand from Adam Murimuth, the canon of St. Paul's, a lawyer and diplomatist. This has never been published or referred to, and is a very unfavorable view of De Bury's character by a man who had "ample opportunities of collecting trustworthy information as to the leading men of his time." He describes De Bury as a man who owed all his benefices to the solicitation of the great and to ambition, prodigal in extravagance in life, and at his death disclosing the greatest poverty. Although only "mediocriter literatus," he says, he wished to be reputed a great scholar, and hence collected a great number of books by gift and purchase. The traits here indicated support an adverse view, and the "account of De Bury's poverty," says the editor, "agrees only too well with several significant indications in Chambre's life, and in the Durham records: *sub judice lis est.*" It seems certain that his library was dispersed immediately on his death, probably being used to liquidate his debts.

It hardly need be added that recent attempts to make De Bury out a scholar, and, as Dr. Creighton calls him, a man "penetrated with the principles of humanism," have nothing to go upon even in the text of the 'Philobiblon.' He had met Petrarch, it is true, and their common taste as collectors might draw them together; but Petrarch complained that he would not answer his letters. It is perhaps best to regard him as an ecclesiastical man of affairs, with liberal tastes and the passion without the knowledge of books; and whether he or his chaplain wrote the words of the work that bears his name, it is hardly to be questioned that it was the spirit of De Bury that gave it life and still breathes in its pages.

Essays Religious, Social, Political. By David Atwood Wasson. With a biographical sketch by O. B. Frothingham. Boston: Lee & Shepard. 1889.

MR. FROTHINGHAM'S volume is in three parts. We have first an autobiographical fragment covering Mr. Wasson's childhood upon a seacoast farm in Maine, Brooksville, near Castine, where he was born in 1823. We have next Mr. Frothingham's biographical sketch, and then eight essays on different but related subjects, political, sociological, and religious. The autobiography is an interesting bit of personal experience related in the sincerest possible manner, somewhat too hortatory in spots. Mr. Wasson's recollection of his early religious training could never be described as "emotion recollected in tranquillity." It always exasperated and excited him; always loaded his style with epithets of indignation and contempt. Work and religion were the two enemies of his childish peace, but religion was the more dreadful of the two, and his treatment of it is the more exhaustive. Mr. Frothingham's sketch is an elaborate and somewhat redundant characterization rather than a distinct account of Mr. Wasson's life. The circumstantial element is very slight, and is presented for the most part in the way of passing allusion. Mr. Frothingham has great sympathy with his subject, and seizes clearly on the salient points of Mr. Wasson's character and thought; but it is the history of a mind and not the history of a person that he has given us. No doubt the limitations of Mr. Wasson's health were such that his biography is resolved into the history of his mind to an unusual degree. But there is a remoteness in Mr. Frothingham's treatment which is eloquent of a literary and not a personal relation to the man. Mr. Wasson was a writer of letters of uncommon brilliancy, few of which are so much as quoted here. He was so much of a poet that the absence of any mention of the fact (it is once implied) is a remarkable defect, probably to be explained by Mr. Frothingham's regarding his volume as supplementary to the volume of poems published a few months ago with Mrs. Cheney's introduction. Whatever the explanation, the circumstance must be regarded as unfortunate.

Mr. Wasson was one of a group of men who occupied a distinct and prominent position in the later stages of the Transcendental movement. The most obvious members of this group were Samuel Johnson, Samuel Longfellow, John Weiss, T. W. Higginson, and O. B. Frothingham. Deeply affected by Emerson and Parker, they were obliged as they went on to reckon with the scientific movement that came in with a flood. Mr. Frothingham went over to the enemy; the others all stood fast, taking up into their thought much from the scientific movement, but denying the inferences of its expositors upon the psychological and theological sides. Evolution found with all of them a ready acceptance, but they held fast to the idea that nothing is evolved which is not involved. Mr. Wasson entered Bowdoin College in 1845, but did not complete his course. He studied theology at Bangor, and in 1851 was settled as pastor of an evangelical society in Groveland, Mass. In a year a council dismissed him because of various heresies. A liberal society was organized for him, and the most of his little preaching was done there in two years, six months at Worcester, Mass., for T. W. Higginson, and two years, from 1865 to 1867, for Theodore Parker's Society in Boston. Increasing invalidism was the occasion of this contracted span of pulpit work. In 1840 he had thrown his antagonist in a wrestling match at the cost of his own back. The hurt was dreadful at the time, and spinal disease declared itself definitely about ten years later. During his last years he was almost entirely blind. Mr. Frothingham cannot sufficiently praise the cheerfulness with which Mr. Wasson bore his physical ills. But we are obliged to wonder, as we read his essays, if we are not dealing largely with a sick man's thought. In its higher ranges it is always optimistic. It is extremely pessimistic when it confronts the problems of our industrial life. This is the tone of a recluse, of a man anxious to serve, and yet compelled to stand and wait. Evidently Mr. Wasson was a man of active spirit. If action had been permitted him, he might not have been so much oppressed by circumstances on which he is compelled to brood in silence and apart.

As the names of the eight essays printed here are not in the brief list of Mr. Wasson's Essays on pp. 391–393, we are left to infer that they have not been before published. They are given without note or comment, or any indication of the time when they were written or the circumstances which called them forth. They are very attractive and inspiring in their religious bearings. These are most evident in the essays "Nature the Prophecy of Man" and "Unity." Though Mr. Wasson did not look to science for his fundamental truths, its enrichment of his thought is evident on every page. His theism is clearly distinguished from the deism of Voltaire and Rousseau, with whom he often breaks a lance. The sociological and political essays have for their burden the foolishness of democracy and individualism. For republicanism and individuality Mr. Wasson had a sufficient admiration. It is impossible not to feel the influence of Carlyle on his secluded thought, though he often differs from him frankly, and was one of his sternest critics at the time of Carlyle's utter blindness to the issues of our civil war. Something of physical violence in the style is also suggestive of Carlyle. There is much in these essays that is striking and important. The style, though full, is not diffuse, but packed with careful meaning. They suffer from the time that has elapsed since they were written. In "The New Type of Oppression" the absence of any mention of trusts is eloquent. One gets a very different impression from Mr. Bryce's treatment of our social and political situation; more hopeful and, we are inclined to think, more just.

The First Ascent of the Kasaï: Being Some Records of Service under the Lone Star. By Charles S. L. Bateman. With 57 illustrations and 2 maps reproduced from the author's original drawings. London: G. Philip & Son. 1889. Pp. xx, 185, 8vo.

THE Belgian expedition for the exploration of the Kasaï, the largest of the southern tributaries of the Congo, reached Stanley Pool in July, 1885, having made the descent of the river from its head-waters. It was under the command of young Lieutenant (now Captain) Wissmann, and was accompanied by some two hundred Baluba, a race of negroes dwelling in the region between the upper courses of the Kasaï and Sankoro. The carrying back of these natives to their homes was the main object of the expedition of which this attractive volume is the account; Mr. Bateman (then in the employ of the Congo Free State) being in command of one of the two steamers used for this purpose. The voyage up the river was marked by no noteworthy incident, save the regrettable destruction of several villages on the lower Kasaï, deemed necessary as a punishment for an unprovoked attack on Lieutenant Wissmann's party during their descent. Like Stanley on the Congo in 1877, he was obliged for eight days to keep up a continuous fight with the hostile natives, who literally barred the river with their canoes.

At the point at which the Baluba were disembarked to continue their homeward journey overland, Mr. Bateman was directed to establish a station, which was named Luebo, after the stream on which it was placed. He gives a clear and entertaining account of the manner in which the site was prepared, the buildings erected and plantations made, as well as of the daily routine of station life, a principal feature of which was "Zanzibari drill," the station being under military discipline. "On Sundays no working parties were detailed, . . . and on Saturdays from two P. M. the men had their time to themselves, and the rations were paid in cowries." The natives of this district were the Bakèté, a somewhat effeminate race, but with singularly regular and refined features.

They are agriculturists, and cultivate a great variety of plants "arranged in symmetrical plots and beds, and separated by wide, perfectly straight alleys, weeded, swept, and maintained in the greatest neatness and order." The settling of a trader, Senhor Carvalho, at the station enabled the author to learn the Portuguese methods of business, which he characterizes as an "unostentatious species of slave-dealing." Slaves were bought from one tribe for "six yards or under of cotton cloth" and sold to another for ivory. This trader gave for a slightly damaged tusk "two young girls, five crosses of copper, 5,000 cowries, 200 twisted Venetian beads."

In June, 1886, Mr. Bateman made a land journey to the station Luluaburg, about one hundred and twenty miles to the east, in the heart of the Baluba country. He had for a companion Lieutenant Wissmann, who was on his way to the East Coast, his second journey across the African continent. At this place a native chief who had defied the authority of the King and the commander of the station, made his submission in a manner which reminds one of a scene in Gulliver:

"After protesting his entire devotion and absolute service, poor Congolemosch retired to a distance of some five or six yards from us, and, throwing himself down on his face, rolled himself towards Lieut. Wissmann's feet. There he licked the ground with his tongue, and, covering his extended hands with dust, raised them in a suppliant manner towards Lieut. Wissmann, who, at this point, lifted him up, and the ceremony came to an end."

The Baluba are in some respects a remarkable people. A few years ago their king abolished fetishism, and they "are in reality without a religion." In its place there has been formed a secret society under the name of "Lubuku, *i. e.*, friendship," into which both men and women are initiated, the chief rites of which seem to be hemp-smoking and the promiscuous intercourse of the sexes. At all the cross-roads there are priapean figures about a foot in height on a round pedestal raised upon a pole. "In front, a flat stone supports a basket, into which passing market-people, and all who have concluded a bargain, make a point of dropping grain or other food, which any starving or destitute person is at liberty to eat; but no prayer or supplication whatever is offered before these fetishes, so far as I know."

Mr. Bateman, who was relieved of his command in December, 1886, carefully abstains from any comments on the present condition or future prospects of the Congo Free State. He is not so reticent in regard to the value of missionary labors among the natives, but gives an unfavorable opinion, not of the zeal of the missionaries, but of their capacity to influence the negroes permanently for their good. It should be noted, however, that he speaks hopefully of the Roman Catholic missions. He has very fully illustrated his narrative, some of the chromolithographs and etchings being excellent specimens of their kind. We can heartily recommend this volume as an interesting account of African life—the first, if we are not mistaken, written in English by an officer of the Congo State; of course, excepting Mr. Stanley.

A Genealogy of the Van Voorhees Family in America; or, The Descendants of Steven Coerte Van Vorhees of Holland and Flatlands, L. I. By Elias W. Van Voorhis. G. P. Putnam's Sons. 1888. Large sq. 8vo, pp. 725.

THIS carefully prepared and handsomely printed volume is in some respects disappointing. In the first place, it is only an index-genealogy, by which term we mean one which merely records the names and dates of births, marriages, and deaths, without any attempt to give interest to the matter by biographical details. Such a genealogy, however well done and however useful to the family, is distinctly second-class. In this case, we are satisfied that the plan chosen has done great injustice to a family which may not have produced any great men, but has undoubtedly had many members worthy of some slight commemoration at least.

We are greatly disappointed in the arrangement, which is on some plan not elsewhere in use, and which does not enable the reader to understand the relationship of the various persons. It cannot be too often repeated that the standard plan adopted by the New England Historic-Genealogical Society is not only the best, but the only sensible, clear, and practical mode. Every deviation from it is an unnecessary freak of ingenuity, always productive of regret. After mankind has settled upon one way of arranging the alphabet, what is the use of printing it in any different collocation of letters? Again, an unnecessary diffuseness of type, however grateful to the printer, adds to the difficulty of comprehension of the subject, as well as to the cost. This book, on a proper system, could have been printed in half the number of pages, and been, moreover, doubled in usefulness.

On the other hand, we desire to give the author full credit for his evident care, thoroughness, and liberality in preparing his book. Dutch genealogies are hard to compile, owing to the scantiness and obscurity of the records, and the excessive variations of the names in the various branches. The ancestor here was Steven Coerte Van Voorhees, son of Coerte Alberts, and grandson of Albert —— (possibly Van Voorhees).

An engraving of the Van Voorhees coat-of-arms is given, without any proof that it belonged to any progenitor of the emigrant. In fact, we presume that, at the period of the emigration, Dutch surnames were in a transition state such as had ceased long before in England, and probably in Scotland and Wales. In that stage of development the surname changed at each generation. William was the only name of a man—his son Steven was Steven Williamson, and *his* son John became John Stevenson. After a few generations, the last accidental surname became hereditary; but own cousins might start two families entirely distinct in name. Then, as the Williamsons, Stevensons, Johnsons, etc., became too numerous for comfort, other special names were adopted: Williamson from Leyden became Van Leyden; from or near Hees, Van Voorhees, etc. But we suspect that, just as in England, a name derived from a place is no warrant of descent from the lord or owner of that place. When Boss Tweed was complimented with the arms of the Marquis of Tweed-dale, he was soon told that the shield bore quarterly the arms of Fraser and Gifford, surmounted by the arms of Hay, but that Tweed had no part therein.

We have written thus fully about a book deserving of much praise, because we have noticed lately a tendency to substitute the splendors of typography for the more humble results of genuine devotion to genealogy. A mere calendar of names is of little worth, but a record preserving even a slight memorial of individuals, however obscure in position, may hereafter be of interest to many. Some of the less pretentious genealogies contain admirable biographies, and where they record only the story of enterprise and struggles, they give life to the picture. Often, indeed, the character of an entire tribe will be shown by the lives of the scattered members. In one the impulse is to action: soldiers and sailors abound. In another the tendency towards the bar, the pulpit, or the medical profession, or a love for mechanics or trade, will be the main feature. Such results may yet justify the time given to the fascinating but often tedious study of family history.

BOOKS OF THE WEEK.

Anderson, W. C. A Dictionary of Law, consisting of Judicial Definitions and Explanations of Words, Phrases and Maxims, and an Exposition of the Principles of Law. Chicago: T. H. Flood & Co.
Arnold, Matthew. Reports on Elementary Schools. 1852–1882. Macmillan & Co. $2.25.
Baldwin, W. J. Hot-Water Heating and Filtering; or, Warming Buildings by Hot Water. Engineering and Building Record.
Barnard, C. My Handkerchief Garden. 25 by 60 feet. E. H. Libby. 25 cents.
Cornaz, Suzanne. Nos Enfants et leurs Amis. Macmillan & Co. 40 cents.
Darling, C. J. Scintillæ Juris. London: Stevens & Haynes.
Davidson, T. Prolegomena to In Memoriam, With an Index to the Poem. Boston: Houghton, Mifflin & Co. $1.25.
Facts about the Salvation Army. Rand, McNally & Co. 50 cents.
Guimps, Baron R. de. Pestalozzi; his Aim and Work. Syracuse: C. W. Bardeen. $1.50.
Hathaway, W. Living Questions: Studies in Nature and Grace. Fords, Howard & Hulbert.

HENRY HOLT & CO., Publishers, New York.

THEODORE MUNDORFF, OPTIcian. Care of the sight. Brazilian pebbles, eyeglasses, opera-glasses, field-glasses, etc. 1167 Broadway, New York, under Coleman House.

POSTAL DICTIONARY.

A Manual of Postage Rates, and Information upon Every Postal Subject which concerns Merchants, Professional Men, Occasional Correspondents, and All who Use the Mails.

Arranged in dictionary form, comprising about 150 titles (with complete index of over 400 cross-references), designed to furnish all facts bearing upon any particular topic, under its subject-title. Compiled from official sources by the Publisher of the New York EVENING POST. 94 pages. Mailed on receipt of price, 15 cents.

THE EVENING POST, NEW YORK.

JUST PUBLISHED:

MARGERY;

A Tale of Old Nuremberg.

By Georg Ebers, author of 'Uarda,' etc. Two vols., paper, 80 cts., cloth, $1.50 per set.

W. S. GOTTSBERGER & Co., Publishers,

11 Murray St., New York.

For sale by all booksellers, and by mail on receipt of price.

The Nation.

NEW YORK, THURSDAY, MAY 9, 1889.

The Week.

THE charge which has been made or hinted against Bishop Potter, apropos of his centennial address, that he hurt President Harrison's feelings by being too pointed, has been disposed of by President Harrison himself, because as soon as he got back to Washington he gave his brother an office, and, it is said, invited Dudley to the White House. These things he would hardly have done if he had been touched by the Bishop's remarks, or cared particularly about the example of George Washington. With Col. Elliott F. Shepard at his back, he can well afford to despise the criticisms of other theologians. Nevertheless, the theologians seem to be rousing themselves and getting on his track. Bishop Huntington of Central New York has given his view of the manner in which Washington would behave, were he alive and in office to-day; and we are bound to say it is a view which can hardly fail to be offensive to the friends of the Administration.

The President gave on Tuesday the first tangible indication of a desire to redeem the pledges of his letter of acceptance, in the matter of civil-service reform, by appointing Messrs. Hugh S. Thompson and Theodore Roosevelt to the vacant places in the Civil-Service Commission. Mr. Thompson is a South Carolinian, who was at one time the Governor of his State, and was Assistant Secretary of the Treasury under President Cleveland, but had, we believe, neither act nor part in Mr. Maynard's little game and is entirely devoted to the reform. Mr. Roosevelt is well known in this State. He is erratic and impulsive, but he is enthusiastic, energetic, and honest, and may be relied on to see that the law is faithfully executed. In fact, the Commission as now constituted is the best we have had, and makes one feel as if the Potter sermon were really beginning to tell. It is noteworthy, too, that Mr. Thompson, the Democrat on the Commission, is the very Democrat selected by the Democratic President for the same place, and not a dummy nor a weakling.

The Senate investigation into Canadian railroads and their operation in the United States has been made interesting by the presence, as witnesses, of Mr. Albert Fink and Mr. John King. The drift of their testimony is to the point that the prohibition of pooling in the Inter-State Commerce Act is injurious, that it has not cured any of the evils that it was intended to remedy, and that it has introduced some that did not before exist. Upon the general effect of the act, taken as a whole, their testimony was less decisive. Mr. King said that one good result of it had been the revelation to the railroads that there was a power superior to themselves. This he considered a benefit to society, although his road would have got $500,000 more money last year if the Commerce Act had never been passed. The competition of Canadian railroads was not necessary, in his opinion, to keep down rates in the interest of the shipper; there would be enough for that purpose without them. But the Canadian railroads were doing useful work, and it was only necessary that they should be brought to the same judgment-seat and held to the same rules as the American roads with which they compete. This strikes us as the keynote of the subject in hand. We have certainly the power to compel observance of our laws by any person or corporation operating in our territory. We have that power under existing laws, if the Commerce Commission's decision in the recent case at Buffalo is sound. If the Grand Trunk Company has suddenly picked up 39 per cent. of the trunk-line business at Chicago, there must be a reason for it not known to the public or to the competitors of that road. Of course, the Commerce Commission is not bound to ferret out that reason: the Commission is already overworked. Perhaps Senator Cullom's committee may throw some light upon this mystery before the investigation is concluded.

An excellent bill requiring the sworn publicity of election expenditures by campaign committees and candidates, after election, is before the Massachusetts Legislature. It is, we believe, the first measure of the kind which has appeared in any of our Legislatures. There have been measures introduced similar to the one which Mr. Crosby presented in the New York Legislature, requiring candidates to publish, after election, sworn statements of all expenditures for campaign purposes. The Massachusetts bill requires publication by both committees and candidates, and is therefore much more comprehensive and desirable. It provides that every political campaign committee, State, city, town, or district, which expends over $100, shall have a treasurer, through whose hands shall pass all the money received or expended, who shall keep a detailed account of all receipts, and of the manner of all expenditures, and who shall, within twenty days after election, "file with the Secretary of the Commonwealth a return, setting forth all of the Committee's receipts, and a detailed statement of all its expenditures and disbursements." Any member of the Committee who receives or disburses any money for political or campaign purposes, is required to give the Treasurer a detailed account of the transaction, and the latter must include it in his return. Whoever shall be elected to Congress or to any State office is compelled, within ten days after election, to file with the Secretary of State a detailed statement of all "moneys contributed, disbursed, or expended by him in attempting to secure, or in any manner in connection with, his nomination or election to such office, provided that all such moneys shall exceed in the aggregate one hundred dollars." An important provision of the bill is one declaring illegal the expenditure of money to influence the action of a caucus or convention, or the result of an election, or the vote of any person in caucus, convention, or election, except by certain legitimate means like circulating printed matter.

The Massachusetts Legislature has passed an act forbidding the docking of horses' tails and punishing it by fine and imprisonment—a very praiseworthy piece of legislation, which we should be glad to see copied in this State. The President of the Massachusetts Society for the Prevention of Cruelty to Animals sends us a "plea for the horse" on this subject which he addressed to the Legislature, and which is for the most part very sensible and forcible. But it is marred, as some of the documents of our temperance friends are, by trying to prove too much. For instance, when Mr. Angell says that "the Almighty gave the horse his tail that he might protect himself from tormenting insects," he asserts something which he cannot possibly know. No one knows why the Almighty gave the horse his tail any more than why he gave man his eyebrows or his beard. If he gave the horse his tail to protect him from the flies, for what purpose did he give him his mane? The mane does not keep off the flies, and, as a matter of fact, neither does the tail, as any one may see for himself by turning a long-tailed horse out in a field in August. A horse's worst suffering from flies, as everybody knows, goes on in places which the tail cannot reach. Moreover, if the tail is a divinely ordained instrument of protection, it must be sinful to cut the hair of it short, although when kept long it is apt to be both dirty and troublesome, and disfigures the horse, in the opinion of a large number of owners. If, too, every appendage an animal has is sacred and has a final cause, is it right for a man to cut his hair or his beard? The truth is that, although docking, like all mutilation, ought to be prohibited because it is cruel, it is absurd to attack it on the ground that horses have a divine right in long tails. On the other hand, a long tail rapidly becomes a great repository of mud and other filth, which somebody has to keep clean; so that if the Almighty meant the horse to have his tail long, he would, in our opinion, to which we challenge contradiction, have given him the means of washing and combing it out. There is, in truth, no better defence for long tails in horses than long hair on man.

Nobody knows how many horses went down on our wretched pavements during the recent parades, because those cases only were reported which resulted in serious injury. But the number was very great. All

along the lines horses were falling, for the reason that we have not in New York a pavement fit for them to travel over—a fact which seems peculiarly absurd when taken together with a glorification of the material progress of a century. No doubt the streets of New York were fitter and safer for horses when Washington was inaugurated than they are now, after a hundred years. No skill of horsemanship avails to keep a horse upright on them if anything goes wrong with him. Inspector Conlin, who was thrown and bruised in Fifth Avenue on Tuesday of last week, is an accomplished horseman, and Mr. Nyegaard, to whom a like accident happened in the same street on Wednesday, breaking his leg in two places, is head riding-master at the largest school in New York, and can save a horse from falling where anybody can. Yet his horse, though prepared carefully for the known dangers of our pavements, went down under him when barely in motion. A horse in harness does somewhat better if, like the cab horse in 'Pickwick,' you "bear him up werry tight and take him in werry short, so as he can't werry well fall down," yet fallen horses in harness are a common enough sight, while saddle horses, which are a good deal more "abroad," never are safe anywhere in the streets. It happens very oddly that almost all the casualties during our celebration of a century of progress should come from the want of decent roads, which are of the rudiments of civilization.

The Thomas Iron Company on Monday made another cut of one dollar per ton in the price of pig-iron, the new rates being $17 for No. 1 and $16 for No. 2. The price in England has been advancing lately, having reached 40 shillings in the Middlesboro District and 44s. 2d. in Glasgow. The state of the iron industry, both here and abroad, is exactly the opposite of what was predicted by the supporters of Harrison in the campaign of last year. If Harrison was elected, we were to have good times in manufacturing circles, and good wages and active trade. If Cleveland was elected, we should have bad times and reduced wages and dull trade. England, according to the same prophets, was looking on with intense anxiety and pouring out her money for the Cleveland ticket, hoping to "deluge" us with iron if he were elected. Well, the Harrison ticket was successful, and what do we see? England is so driven by the demand for iron that all her works are *fully* employed. She could not supply any considerable American demand, even if there were no tariff on iron, without disappointing her present customers. On the other hand, our works are either reducing wages or closing up, and prices are falling. What *would* have been said by our tariff friends if all this had happened under a second Cleveland Administration?

The copper market abroad is slowly returning to the normal conditions of supply and demand. For the first two weeks of April the arrivals at the principal English ports were only ninety-one tons in excess of the sales for consumption. The statistical position on the first of May showed, for the first time in eighteen months, a diminution of the stock on hand. The price in the English market is £38 per ton for "good merchantable," which is 17 shillings lower than the price ruling before the French Syndicate, under the leadership of M. Secretan, began operations. The public, however, look for still lower prices, the stock on hand being so disproportioned to the ordinary conditions of the trade. This is estimated at not less than 125,000 tons, but is probably greater—the London *Economist* of April 20 says 175,000 tons. The fact that this large stock is now in strong hands counts for nothing unless the mining companies can be persuaded to restrict their output for a long time. The *Economist* of the 20th says that "some of the people principally interested in the syndicate, including the liquidators of the Comptoir d'Escompte, have been in London this week endeavoring to patch up an arrangement with the producing companies, but we understand that the difficulties in the way of a settlement appear to be increasing rather than diminishing. The European companies seem to be willing to accept any terms the representatives of the syndicate choose to offer; but the American and Cape companies, which really hold the whip hand, have adopted a firmer attitude." It is one of the humors of the copper situation that M. Secretan, after having been fined his entire fortune for his participation in the syndicate, is now under prosecution in the courts for an additional fine of 50 to 10,000 francs for violation of an article of the Penal Code on forestalling and regrating.

There seems to be no doubt that the American Congress of next October will be at least well attended. The invitation to be represented at it has already been accepted by Mexico, Columbia, Chili, Ecuador, the Argentine Republic, and the Central American republics, and they will, unquestionably, be joined by the other countries invited. The only possible exception is Brazil, from which empire no intimation has yet come. The attitude with which the Spanish-American representatives will come to the conference may be inferred from a most suggestive article in *Las Novedades* of April 26. That paper is the official organ in this country of Spain and Spanish America. It refers to the almost absolute indifference of the South American press to the coming Congress—an indifference which our own observation, as far as it goes, fully corroborates. Nothing but the vaguest references to the matter are to be encountered, and these, while expressing an amiable desire for political friendship with the United States, do not at all contemplate any efforts to promote our commercial interests. *Las Novedades* itself has all along maintained that little is to be expected from the conference except empty talk, and significantly says to those who think they see such a "good thing" in it for American trade: "The Congress will not be a bed of roses, and even may turn out to be a free fight as soon as it is proposed to the representatives of Spanish America to virtually reëstablish, in favor and for the benefit of the United States, the colonial system which they destroyed in 1810."

It goes on to quote from a private letter written by a man who, it says, is "one of the most eminent of the public men of South America," as follows: "I do not believe that the Spanish-American republics will fall into the snare prepared for them in the projected Continental Congress. Uniformity of weights, measures, and coinage; better postal facilities; subsidies to new lines of steamers engaged in the South American trade—all this would be possible and useful; but unification of tariffs, or anything like it, never. They propose, for example, that we should admit their cotton and woollen goods free of duty, in exchange for a similar concession to our products, such as coffee, tobacco, cocoa, copper, etc. But this would imply the destruction of our customs revenue, two-thirds of which comes from duties on precisely those fabrics." Such remarks as these are only samples of what we are likely to hear in the future. Our public men and merchants are destined to have their eyes opened most disagreeably, if they persist in our old mistake of regarding the political leaders of South America as children in arms, just the persons to be taken in by a little Yankee smartness. They will find that the republics to the south of us have as well-settled a commercial policy as our own, and at least as intelligent. They will have to encounter a sentiment of nationality as proud and strenuous as our own, quick to resent any attempt to disregard or override it. They will meet delegates fully their equals in education, skilled in diplomacy, versed in economic law, and far from proposing to take the iron by the hot end. In short, they will probably get another chance to learn the simple lesson they seem to find it so hard to master—that talk and tricks cannot circumvent the natural laws of trade.

As soon as the news of Mr. Blaine's selection as Secretary of State reached Spain, it caused a sensation in that country. The newspaper *El Imparcial* at once declared the announcement of the name of the new Secretary to be of the gravest importance to Spain. The Minister of Foreign Affairs said the same thing in the Cortes, and promptly moved that the squadron in the West Indies be immediately strengthened. It seemed to be generally felt that there was danger of the loss of Cuba, and patriotic talk about there not being money enough in the world to buy that island grew to be the common thing. But our portentous Secretary roared most gently in response to Spain's ruffling, and hastened to assure the haughty Dons, so the cable shortly told us, that they would find him the quietest and most peaceable man in the world. As to Cuba, his intentions were of the most honorable sort; all he wanted was to buy her sugar, not herself. Chili will doubt-

less take courage at this and dismiss her fears. The *Estandarte Católico*, a paper published in Santiago, referred in its issue of March 4 to the probable accession of Mr. Blaine, "the famous ex-Minister and ex-candidate who gave us so much trouble in former years. We learn from private advices that Blaine, who makes no concealment of his hatred of Chili, perhaps on account of the unpleasant memories which the name suggests, will do everything possible, if he succeeds to the Secretaryship, to show us hostility." But this is to forget that Mr. Blaine has grown older in the past eight years, and is no longer the fighter he once was.

The opening of the Paris Exposition is so much like other events of the kind with which the public are now familiar, that there is little to be said of it from the mechanical or the artistic point of view. Notwithstanding the abstention of the great Powers of Europe and the temporary withdrawal of their ambassadors, the Exposition is a success. The action of the Powers in this matter will probably strengthen the republic as a form of government, since the alternative to it is some form of monarchy, Cæsarism being one of the forms. It is perhaps natural and excusable that the great Powers should decline to take part in the celebration of an event which cost them millions of lives and hundreds of millions of money. It is still an open question whether the French Revolution was a good thing or a bad thing for the world—whether the undoubtedly good results that flowed from it might not have been gained with less suffering and cost. But it is not doubtful that to the reigning families, the governing classes, and to Order as it is now represented and defended in Europe, the Revolution was hell upon earth. Therefore they need not be expected to show it any welcome to-day. To do so would be a false pretence. But the temporary withdrawal of their Ministers, lest their ears should be saluted with the music of the "Marseillaise," is a small business. No disturbance will grow out of it, but the effect of it on the French mind will probably be to confirm their attachment to the principles of the Revolution and to the Republic as the outcome of it.

Another stage has been reached in the German system of compulsory insurance for workmen. Our readers will remember that the legislation as it stands now provides for insurance against sickness and accident; the next step is to bring about compulsory provision for the care of permanent disability from old age or other cause. We have noted in these columns the first shape of the bill by which this part of the system is to be established, and in the Harvard *Quarterly Journal of Economics* we find an account of the measure as it stands at the present session of the Reichstag. The original bill introduced by the Government was first modified by the Government itself, and has been further modified in the committee to which it was referred by the Reichstag. All the modifications are in the direction of more liberal provision for the workmen; and as the beneficiaries continue to pay only a third of the contributions (the other two-thirds being paid by the employers and by the Imperial Treasury, respectively), this means that a still heavier levy is made on the rest of the community for their advantage. The scheme has become more top-heavy, in that the pensions for the aged or disabled workmen are graded, varying according to the wages they have been earning. It remains entirely bureaucratic—the Government runs the machinery throughout; the approach to Socialism is nearer and nearer. Later advices inform us that the committee has completed its labors, and that its amended draft of the bill is ready for action by the Reichstag. The chances are that the measure will be passed, perhaps with more modifications. It will form the last important part of this gigantic scheme for help to the poor.

The *Indépendance Belge* recently published a report of a speech made in the Italian Parliament by Count Giusso, ex-Mayor of Naples, and now a deputy from that city, which sets forth in strong terms the great depression in agriculture, and the critical condition of the public finances, brought about by the new policy of protection and militarism. The Count recites the disastrous exhibit made by the foreign trade of Italy in 1888—exports decreased by $24,000,000, and imports by $42,000,000. He admits that some new branches of manufacture have become flourishing at the expense of the people, saying: "We have preferred the shop to the land; we have preferred the coal which we do not possess to our Italian sun; we have preferred the motive force of steam to the most powerful motive force in the universe—the sun; and we are naturally suffering the sad consequences." He makes a moving recital of the alarming distress existing in the agricultural provinces of the South, affirming that "the Utopian idea of creating an industrial Italy on the ruins of agricultural Italy, has been a colossal error, big with disastrous results." From one end of the Peninsula to the other the cry is, he says, "Give us the means of selling our products, and we will pay the taxes." All this certainly seems to be borne out by the late report to Parliament of the Chairman of the Budget Committee, Signor Luzzatti. He shows that the floating debt of the Treasury will be $100,000,000 by June 30, while the deficit for the current year will not be less than $46,000,000 if the increased military expenditures are put through as proposed. That Crispi shares the common opinion that the trouble is largely due to the abrogation of the French commercial treaty, is shown by his having got himself authorized by the Parliament to open negotiations with France for a new treaty. Yet there is a strong war party urging the Government to seize upon the chance for conquest just now offering itself in Abyssinia, and it is hard to say what the result will be.

Mr. Parnell's admission, before the Commission on Friday, that he had declared in a speech that the Land League had suppressed secret societies in Ireland, when he did not himself believe it, and had uttered the falsehood with the deliberate purpose of deceiving the House of Commons so as to prevent the passage of the Coercion Bill, is the most extraordinary and least comprehensible incident of the Irish trouble. It hardly needs examination from the moral side, but as a matter of policy it is a singular blunder for an astute man to commit. More flagrant fibs for the purpose of deceiving Parliament have been told by distinguished Englishmen—more flagrant because they concerned matters within their personal knowledge. The most noted was Lord Salisbury's in 1877, when he denied, in the House of Lords, the authenticity of the published copy of his secret understanding with Russia, with naked intent to deceive; but he did not afterwards get up and acknowledge that he had lied, and chuckle over it. Disraeli was a dexterous practitioner of the same mode of catching Parliamentary votes, but neither he nor Salisbury lost character with his party through his departures from truth, because he showed some respect for public opinion by keeping quiet after he was found out. Mr. Parnell had far stronger reasons for caution than either of them, as he spoke before a hostile or prejudiced community which already doubted his word, and because the fortunes not only of the Irish party, but one may almost say of the English Liberal party, depend on his coming well out of his present ordeal.

The explanation offered by Parnell on Tuesday only makes the affair more mysterious than before. On examining the speech, out of which the Attorney-General sought to prove him guilty of self-contradiction, he now says he discovers that what he said in the House of Commons was quite true—namely, that the League had extinguished "Ribbon Societies." So that it was when he said that he had deliberately tried to deceive the House of Commons that he was saying what was false. How so astute a man as he failed to examine the speech before answering the Attorney-General's question, and how, without examining it, he promptly confessed that in making it he asserted what he knew to be untrue, is, of course, inexplicable at this distance. His election as a life member of the National Liberal Club and his receiving the freedom of the city of Edinburgh since the affair occurred, seem to indicate that the Liberals explain it by some sort of nervous breakdown under the strain of a prolonged and trying cross-examination. The cross-examination ended on Wednesday morning, and, but for the above-named incident, without doing him any damage. Probably the slight importance apparently attached to it is in part due to the fact that the object of the proceeding is to connect Parnell with the promoters of crime and outrage; and this being so, the revelation that he told fibs in the House is deemed of comparatively small importance.

NATHAN AND DAVID.

BISHOP POTTER'S address at St. Paul's on April 30 was remarkable in two ways. It was the first, and, indeed, we may say the only public and official attempt to call attention to the moral lessons of the occasion. It was he alone who reminded the public that the Constitution was not an automatic thing; that it did not work of itself; that the manner of its working and the results of its working depended on the moral and intellectual quality of the men behind it; that in a voyage in the "Ship of State" we are as much dependent for a happy and prosperous issue on the men who watch and steer, as in a voyage in one of the "ocean greyhounds." All, or nearly all, other commentators on the great anniversary have told us over and over how rich we have grown under the Constitution; how many miles of railroad we have made; what the increase in hogs, cattle, grain, banks, and coasting steamers has been since George Washington assumed the Presidency. Bishop Potter took on himself the solemn and salutary duty of asking whether, besides growing in wealth, we had in the last hundred years grown in grace; whether the statesmen of to-day were of the same type as those of Washington's day; whether they were living up to the standard of public duty which Washington set up; and in short, whether the Government was really travelling in the road on which the framers of the Constitution started it.

These questions have often during the last few years been put in books and pamphlets and addresses of one sort or another, but have for the most part wasted their force on the desert air. Bishop Potter has rendered us all the inestimable service of putting them, in church, in full canonicals, to the audience which they most concerned. The imaginary picture which he drew of Washington dealing with an office-seeker who asked that public office should be treated as "spoils" for his benefit, was as impressive—considering the surrounding circumstances—as anything recorded in literature since Nathan reminded David of all the trust the Lord had placed in him, and of the gross and shameless way in which he had abused it. The enterprise in which the people of the United States are engaged is, in truth, a moral far more than a commercial enterprise. Its final success depends far more on moral than on material conditions. The "business" view of it has a thousand trumpeters. Our politics is full of "business men," with their clubs and their organs. The last campaign was "a business" canvass, we are told, and the Cabinet is full of "business" men seeking and giving "business." The land is filled with the voice of the drummer proclaiming to all the world what a "business" country this is. Let us, therefore, be grateful to the preacher who rose up in his place in the pulpit, on the most solemn of our anniversaries, to remind us that nations do not live by "business" alone, but by recognizing and encouraging in the public service the qualities which alone make private life respectable or useful.

The second service which Bishop Potter has rendered to the community is in reminding the practitioners of the spoils system that they cannot in our day get rid of Mugwumpery and all that the term implies. They are constantly flattering themselves, especially when they win an election, that the Mugwumps have disappeared, and that their ears will be no more troubled by protests against gambling in the public offices and stealing money out of the Treasury as salaries for party hacks and adventurers. They are in this like the Indians on the plains, who, in former years, whenever they cut off a detachment of troops, thought they had killed all the white men there were, and that they should thereafter possess their hunting-grounds in peace. The spoilsmen have chosen to give the name of Mugwumps not only to everybody who finds fault with their system and exposes their little games, but to every office-holder who, by refusing to be active in politics and by displaying marked diligence and capacity in the discharge of his official duties, establishes a claim in the public eye to the permanent retention of his place. It was for this reason solely that they hated Mr. Pearson and hunted him to death. They are intent to-day on warning every man in the public service that he must not make himself conspicuous by his devotion to his duty, or in any way make himself a contrast to the general run of political "workers." They flatter themselves that by these and similar processes they will stamp out the pestilent notion that the Government is entitled to the same faithful service as the private employer, and owes its faithful servants the same confidence and rewards which the private employer owes to his.

Bishop Potter's utterances will do them a world of good in showing them that they are never safe from Mugwumps, and never will be safe as long as there exists in America a man or woman who hates fraud and injustice and cruelty. Probably the last place in the world in which they expected to see a Mugwump start up and warn them of the wrath to come was the pulpit of St. Paul's Church on the thirtieth day of April. It seemed even more unlikely that they should find their Nathan there than at a Plummer or Wanamaker "banquet;" and yet there he was, in prophet's robes, pouring on them a prophet's blasting scorn.

DISMISSAL OR REMOVAL.

THE *Watchman*, the Boston Baptist organ to which we referred last week as asking for a suspension of judgment with regard to President Harrison, has since then initiated a fresh wriggle touching Postmaster Pearson's removal. Admonishing the *National Baptist* on the sin of talking of Pearson's having been "displaced for political reasons during the closing hours of his life," the *Watchman* says, with an air of sadness:

"We have noted not a little said in the same strain of remark with the above, but chiefly in the secular press. For the most part it is not difficult in all this to detect a spirit of a partisan, at least of a political animus quite akin to that spirit, which, in the same breath, is unsparingly condemned. 'Displaced,' as in the foregoing, 'removed,' 'turned out,' are the words used to characterize the matter of Mr. Pearson; all of which fail utterly to meet the case. Mr. Pearson was not 'removed' nor 'displaced.' He had served faithfully two successive terms, of four years each, the second term having expired with the advent of April, as his father-in-law, ex-Postmaster-General James, had served—with Mr. Pearson as his assistant—since 1873; an administrative term never, certainly in New York, paralleled as to its length in the same family. He was simply not reappointed for a third term."

We wonder whether the writer of this has ever asked himself why four years or eight years should be considered long enough for an able and competent man to remain in charge of an important business. Has it ever occurred to him to inquire whether the Superintendent of the Adams Express Company or the Manager of the Pennsylvania Railroad Company every year calls into his presence those of his subordinates who have held their places for four years and addresses them as follows?—"I have, gentlemen, the highest appreciation of your talents and character. You have done your work admirably and the company is much indebted to you. But you have got to go. Every one of you has held his place for four years, and some of you, by an extraordinary stretch of indulgence, for eight years. You know as well as I do that four years is the American business cycle—that is, the period for which an American ought to stay in any one place. No one ought to keep a business place on a salary more than four years, because the object of the business is, of course, to give the largest possible number of persons a hack at the salaries. There are now many applicants for each of your places, who have been for some time urging me to dismiss you at once, in order that they might have their turn in carrying on our business; but I have shown them the absurdity and unfairness of dismissing you until you had served four years, and they have generally acquiesced in my reasoning. The fact is, when you go at the end of four years, or at the end of eight, you are not dismissed at all, or displaced either. You simply fail to be reappointed. You might say you were discharged, or removed, if you had to go at the end of two years, or three years, or six years; but I challenge any man within the sound of my voice to say whether he thinks he is removed when he goes away at the end of a quadrennial term. Doubtless those of you who have spent eight years in our service may find it difficult to get other employment, and your families may suffer in consequence, but no right-minded man will repine under this when he remembers that he is cast on the world under the quadrennial rule. He suffers from this as he suffers from cold in winter, but no one is to blame because winter comes."

The editor of the *Watchman*, if he were present at such a scene as this, would be both amused and indignant, and yet its absurdity in the case of Postmaster Pearson is just as great as it would be in the case of the railroad employees. Such is the effect of long usage in blunting even the commonest business perceptions. The four-year term, when enacted in 1820, was simply meant

to provide a period at which officers intrusted with the public funds would necessarily have to make an accounting. It was found that, owing to a faulty system of inspection, or the absence of any system, officers who were in default were frequently allowed to run on for years without being brought to book. So it was provided that every such officer's term should legally expire in four years from the date of his appointment, so that at that date he would be compelled to make an accounting. When the spoilsmen came into power under Jackson, this act was eagerly seized on as a good mode of applying the hog theory to the public service—the theory, that is, that the public service is a fund paid out in salaries which a certain number of individuals are entitled to share in their turn. So they soon made it appear that, at the end of four years, not only should an officer make an accounting and submit to an audit, but should vacate his place, so that somebody else might get some of the "pap" he had enjoyed during this period. This doctrine has through mere familiarity permeated the intellectual apparatus of great numbers of good people, like the editor of the *Watchman*, until at last they have come really to believe that there is some principle of government which requires that an efficient and experienced officer should be dismissed, by not being reappointed, at the end of four years, although, if they heard of a railroad president or the superintendent of an express company carrying on his business in this way, they would think him crazy.

"THE TOBACCO FRAUDS."

On the 25th of February last, Secretary Fairchild wrote a letter to the United States District Attorney in this city, submitting certain "facts" to him to see whether "therein there was sufficient evidence to convict certain guilty parties of violation of the statutes" against fraud in collection of the revenue on Sumatra tobacco. He then continued:

> "This I leave to your better judgment; but I consider that Assistant-Appraiser Sturges and Examiner Hammill knowingly aided in admitting this tobacco to entry upon false classification, and upon payment of less than the amount of duties legally due thereon, and I have therefore caused their dismissal from the service. Appraiser McMullen's attitude towards the whole matter was one of such indifference and inefficiency, and this was so in accord with much of his conduct heretofore, that I procured his dismissal; but I am not disposed to believe that he wilfully aided in this attempted fraud, and therefore I do not ask you to prosecute him. Upon consultation with the Collector, you may determine that you can also make a case against some of the owners of the tobacco."

It will be seen that he here charges two of his subordinates with an indictable offence, finds them guilty himself, and inflicts on them the terrible punishment of dismissal in disgrace, and in the same breath asks the District Attorney to see whether there was "sufficient evidence" against them for an indictment. Be it remembered, "sufficient evidence" to warrant their dismissal with public opprobrium must be sufficient evidence to warrant their indictment and trial. If Mr. Fairchild's "facts" justified his inflicting this frightful injury on two officers of long standing in the service, on his own mere motion, they must necessarily have justified the submission of the charge to a jury. When a grand jury finds an indictment, it does not say that the charge is proved. It simply says that there is good ground for judicial inquiry.

We felt sure all along that there was no more substance in these "tobacco frauds" than in the "sugar frauds"; that they were both concocted in support of a scheme of long standing for getting rid of Mr. McMullen, the Appraiser, and of as many of his Republican assistants as possible, so as to leave Assistant-Secretary Maynard a clearer field for his peculiar operations. We were, therefore, not at all surprised to learn last week that District-Attorney Walker had reported to the Attorney-General, that there were no facts sufficient to maintain an indictment, and that nothing more would be heard of "the tobacco frauds." So far so good. But this failure to indict, this confession that there was no evidence which the Grand Jury would consider reasonable ground for suspicion, does not redress the great wrong of which ex-Secretary Fairchild has been guilty. He has printed in a public official executive document (No. 142), thus making it a privileged communication and putting himself beyond the reach of legal punishment at the hands of his victims, a charge of the most disgraceful character, which they have no opportunity of answering, and which must for ever remain a deep injury and mortification to themselves and their children. He has added injury to the insult, so far as lay in his power, by dismissing them from the service a few days before he himself went out of office. Should a public officer be allowed to commit acts of such atrocious cruelty and injustice, and then quietly escape into private life with the reputation of a reformer? We think not, and there are few honest and intelligent men who will not agree with us. Mr. Sturges, the Assistant Appraiser, who has been stigmatized in this outrageous way, and in nineteen years of service has borne an excellent character, did not actually examine the bales of tobacco in which the alleged frauds occurred. The actual work was done in the usual course by an examiner, and yet throughout Mr. Fairchild's letter, line after line, and paragraph after paragraph, the whole work is described as having been done "by Sturges," with the obvious intention of representing him as the direct perpetrator of the alleged fraud.

What aggravates Mr. Fairchild's offence is the peculiar nature of the duty on Sumatra tobacco. Sumatra tobacco consists of large, strong, flexible leaves, which are imported into this country solely for the purpose of making cigar wrappers. The law under which duty is levied on it makes it liable to 35 cents per pound if the pound contains less than 100 leaves; to 75 cents per pound if the pound contains more than 100 leaves. It will be readily seen from this that it must often depend on the weight of a single leaf whether any particular pound pays 35 cents or 75 cents. Moreover, the tobacco in the bale is more or less charged with moisture, and a pound drawn out from the bale, which, when first exposed to the air is only liable to 35 cents, may, after fifteen or twenty minutes of desiccation, become liable to 75 cents. The bales, too, are examined by sample. A few "hands" or bunches of the tobacco, each fastened with a string, are drawn forth, and the whole bale is assessed according to their weights. The temptations to fraud created by this ridiculous mode of levying the duty are plainly great; but so is the liability to honest error. Both facts have to be borne in mind by any one proposing to attack the character or livelihood of an appraising officer.

In the present case the amount of which the Government, according to Mr. Fairchild, was defrauded was $6,354.52. The number of bales on which the alleged fraud was perpetrated was 275. To assess the duty on these, 29 were examined by sample in the manner described. Of these latter, 24 were reëxamined, also by sample, by the Secretary's order, in order to detect the fraud.

The samples drawn per bale weighed from 2¼ to 3¼ pounds, or about 1½ per cent. of the weight of the bale. The number of leaves drawn from each bale ranged from 220 to 359. The general range of count of leaves was from 5 to 0 above and below the dividing line between the rates of 35 and 75 cents; the extreme departure from that line being 12 above and 14 below. The weight of the "hands" ranged from 2 19-32 ounces to 6 24-32 ounces. A single bale taken at random shows the following departures from the dividing line for the ten hands drawn, in their order: 6 leaves below, 11 above, 2 above, 3 below, 2 above, 1 below, 9 above, 5 above, 6 above, and 3 above. Taking these facts together, it is perfectly safe to say that the bales in both importations run exceedingly close to the dividing line, and that two successive drawings of samples for classification would be as little apt to produce the same result as would two successive turns of a kaleidoscope.

The most important fact in this connection is that a slight fluctuation in the examined samples between the first and the second inspections is quite sufficient to account for even a much larger discrepancy in results, as regards amount of duty, than is shown in this case; for it must be borne in mind that a change from 35 cents to 75 cents in the rate is an advance in duty of over 114 per cent. upon all the tobacco affected by such change, and *that a single leaf in the count may produce that change for an entire bale;* or say 180 pounds at 40 cents (the amount of advance) would give an increase in duty of $72. That this is not fanciful can be shown by practical illustration from the statements in the document before us:

Lot No. 1, *ex P. Caland*, contains twenty bales, weighing 3,373½ pounds, all originally classified at the 35 cents rate, but reclassified—80 per cent. at 35 cents and 20 per

cent. at 75 cents—giving aggregate amounts, viz.:

First classification	$1,180 67
Second classification	1,450 51
Difference in duty	$269 84

Upon a reference to the statement of details relating to the examined bale No. 579, it will be seen that in the count of 304 leaves drawn, the transfer of a single leaf from one hand to another would increase the above difference 50 per cent., making it $404.76, instead of $269.84.

We might carry these illustrations further, but the above is sufficient to show the extraordinary recklessness with which Mr. Fairchild acted in attacking the character of his subordinates and driving them from the service. There ought to be some legal remedy for such gross abuses of power. A civil service worthy of the country will not be obtainable until such a remedy is provided.

CANADIAN AND AMERICAN RAILROADS.

A COMMITTEE of the United States Senate, in pursuance of a resolution of that body, has commenced an inquiry to learn whether any railroad lines located in the United States are owned, operated, or controlled by the Grand Trunk Railway Company, the Canadian Pacific, or any other company or corporation; whether commerce originating in the United States is diverted from American to Canadian lines, and if so to what extent and by what means; and whether there is any discrimination in the charges made for tolls or otherwise against American vessels which pass through the Welland and St. Lawrence Canals. The Committee are charged also to "inquire fully into the question of the regulation of the commerce carried on by railroads or water routes between the United States and Canada, and to represent what legislation, if any, is necessary for the protection of the commercial interests of the United States, or to promote the enforcement of the Act to Regulate Commerce, approved February 4, 1887"; the act referred to being the Inter-State Commerce Act.

The phrase "protection of the commercial interests of the United States" has an ominous sound, because the accepted meaning of protection is to give one citizen or class of citizens an advantage over others, both being Americans. Commercial interests always include two parties, sellers and buyers; but when we talk of protecting commercial interests we always mean the interests of the seller. For all purposes of legislation the buyer is completely ignored, and mainly for the reason that he does not take pains to make himself heard and felt at Washington city. Government is a corporation in which the only effective shareholders are those who stir about and make a noise and a fuss. This, we judge, is what certain railroads have been doing. They are sellers of transportation, and they want protection against the competition of the Canadian railroads that enter our territory.

Mr. Joseph Nimmo, Jr., has been firing off pamphlets on this subject at intervals for two or three years, in which the grievance of competition with the "subsidized" Pacific Railway of Canada is set forth in a glaring way. "From the very beginning," says Mr. Nimmo in his latest essay, "the projectors and promoters of that enterprise, in making a commercial survey of this country from the Atlantic to the Pacific, were in the habit of using expressions which seemed to say: 'Moab is my washpot, over Edom will I cast out my shoe.'" If anything of this sort can be proved before the Committee, means must be found, of course, to improve the ideas of the Canadians and their manner of putting them to us. The particular expression which brings Moab and Edom into Mr. Nimmo's recollection is found in an official publication of the Canadian Government, in which it is said: "Already notes of alarm have been sounded by the American press at the manner in which the Canadian Pacific Railway is cutting into the business of the transcontinental roads of the United States." Now, cutting into the business of a railroad can only be accomplished by doing it at lower rates. This is especially true where the cutting road is a longer and more roundabout route. The Canadian Pacific Railroad, for most purposes of competition with our lines, runs on three sides of a parallelogram, while ours run on the fourth side. At equal rates, therefore, it would get no competitive business. It can only compete successfully by offering lower rates, and this, we believe, it does not do at present. Mr. Van Horne, the President of the Canadian Pacific Company, in a brief letter to Mr. Nimmo, says that the business done by his road from one American point to another does not constitute 4 per cent. of its earnings. If it constituted 40 per cent., it ought not to be interfered with by Congress, unless the law-making power, contrary to all recent examples, is going to busy itself with means to raise the cost of railroad transportation to the shipper. Both the Western farmer and the Eastern manufacturer are content to be considered the washpot of Moab, and to be pelted with the shoe-leather of Edom, if these come in the form of lower rates of fare and freight.

It may be, however, that the Inter-State Commerce Act has weighted our own lines with burdens and conditions which make the competition of Canadian roads unfair. The Grand Trunk Railway was found recently to be carrying coal from Buffalo to Hamilton and other points in Canada for seventy-five cents per ton, although its published schedule of charges was one dollar. The Michigan Central Company complained of this as a violation of the Inter-State Commerce Act. The Grand Trunk contended that its Canadian line was not subject to the act, and that, if it were, no damage or injury had been shown to have resulted from its action in the premises. Both points were overruled by the Commission, and it was ordered to make its charges conformable to its published tariffs.

It would be very strange if facts had not transpired since the passage of the Commerce Act showing the need of special treatment and amendment as regards the relations of the Canadian and American railways. The investigation will, doubtless, tell what these are and suggest the proper course to be pursued. But it should be understood that any measure for the "protection" of our railways against those of Canada means that our people should be compelled to pay more money for transportation than it might be had for. The public will be able to see this when it is put before them, even if they cannot see the true color of protection when it comes to them in the form of manufactured goods.

THE CUNEIFORM TABLETS OF TELL EL-AMARNA.

PHILADELPHIA, April 25.

PROF. SAYCE calls Egypt the land of surprises. A recent and most remarkable surprise is the finding of an official correspondence carried on some three thousand years ago between Egypt, Babylonia, and other Eastern districts. As often happens with important finds, the discovery was purely accidental. Fellaheen, while searching for bricks to serve as building material in the mounds at Tell El-Amarna, a village lying about one hundred miles to the south of Cairo, came across several hundred small clay tablets covered on both sides with cuneiform characters. The tablets were offered for sale in Cairo; as the result of a competition that naturally ensued in archæological circles, the Berlin Museum carried off the lion's share with about 160 tablets, the British Museum secured 81 pieces, the Bulak Museum about 60, while some 70 are still in private possession. Such is the simple story of a discovery that turns out to be of the first magnitude.

From Egyptian and other sources it was known that King Amenophis IV. of Egypt, who reigned about 1,300 years before this present era, had established an official residence on the site of the modern Tell El-Amarna. Owing to the religious reformation which he attempted to carry out in his kingdom (his aim apparently having been to establish sun-worship alone, in place of the prevailing polytheism), this ruler is generally known as the "heretic" King. He failed in the attempt, and soon after his death the city he founded was deserted and fell into decay. Extensive mounds alone remain to testify to the former grandeur of the place, but there is little doubt that a thorough excavation would bring to light considerable portions of the buildings at present buried beneath accumulations of dust and rubbish. That the palace of Amenophis IV. actually stood at Tell El-Amarna is now fully confirmed by the precious tablets that were taken out of the mounds, for the greater number of them are letters written in the Babylonian-Assyrian language, addressed to none other than this very king. The material on which these curious letters are written is the soft clay commonly employed by the Babylonians, from whom the custom was adopted by the Assyrians. The conservative instincts of Oriental nations led to the retention of this material, even at a time when the more convenient papyrus was already known to the Babylonians, much as we, in the age of paper, still use the mediæval parchment for certain official documents. The average size of the tablets is three inches square, but some are as large as nine by five inches.

Passing to the contents of these tablets, we find that they open up a vista of the relations existing between the political powers of a gray antiquity, which is to the highest degree surprising. We find the diplomatic intercourse

between Egypt and Babylonia to be far more lively and intimate than we had any reason to suppose; we see Egypt maintaining close relations with other countries, scarcely known to us by aught but their names, though they must at one time have played no insignificant part; we see the rulers of the Nile receiving regular reports from their officers stationed in various quarters. Only a small proportion of the tablets have as yet been published, and of these not all have been fully deciphered. Scholars are now at work on the collections in Berlin and London; but enough has appeared to enable us to form a general idea of the nature of the more important of the letters. Even at the present imperfect stage of our knowledge, we are warranted in drawing certain conclusions of considerable moment.

Among the correspondents of the Egyptian King, there is one who has a special interest for us, from the fact that he was already known from the monuments in cuneiform writing which we possess. He is Burnaburiash, the King of Babylon. On a brick found in southern Babylonia several decades ago, this King, styling himself (in accordance with official custom) the "powerful," commemorates a temple that he erected in honor of the sun-god; it was no small surprise to scholars to meet with his name again on a tablet found in a locality so far removed from Babylonia as Tell El-Amarna. For reasons that need not be detailed here, the identity of the two Burnaburiashes in question is beyond all reasonable doubt, and we have thus obtained an exceedingly important meeting-point of Egyptian and Babylonian chronology. In one tablet to the Egyptian King, the Babylonian, after referring to an unpleasant message that he had received from his Egyptian colleague, calls upon the latter to give him renewed assurances of his good will and confirm the friendly relations formerly existing between the two countries. As an index of his own peaceful policy, Burnaburiash recalls the presents that on former occasions he had despatched to the Egyptian court. The latter part of the tablet is unfortunately quite mutilated, and the continuation is therefore somewhat obscure. It appears that Burnaburiash lodged a complaint against Amenophis for an injury that had been inflicted on a Babylonian, and demanded an explanation and also the payment of damages. It is evident that a regular diplomatic intercourse had existed between Egypt and Mesopotamia for some time previous—how long before the reign of Burnaburiash, it is of course impossible to say; but as the latter is a monarch of the so-called Kossæan dynasty, with whom a new era in the political history of Babylonia begins, it is not too hazardous to date the beginning of the interchange of messages between Egypt and Mesopotamia from at least the rise of this dynasty—that is, about the sixteenth century. As far as we know, the relations between the two countries were always of a friendly character, which is in itself a rather remarkable fact, for the monuments both of Egypt and Mesopotamia as a rule speak only of wars and devastations, rarely of peace and good will.

Apart from its contents, the letter is also interesting from its opening formulas, in which the Babylonian embodies a greeting to his brother, much as an Eastern potentate would do to-day. The letter begins:

"To Naphuria (surname of Amenophis) the great King, the King of Egypt, thus speaks Burnaburiash, the great King, the King of Babylonia, thy brother. To me and my house, to my horses and chariots, to my officers and my country, may there be abundance of peace. To my brother and his house, to his horses and to his chariots, to his officers and his country, may there be an abundance of peace."

Horses apparently took precedence, in the eyes of these rulers, of human beings, though, on the other hand, we must remember that by horses are here meant war-horses, and the expression "horses and chariots" is but a synonym for army.

Even more interesting is the correspondence that passed between Egypt and a ruler who calls himself Dushratta, King of Mitanni. Some of the letters are addressed to Amenophis IV., but others to the latter's father, Amenophis III. We may properly suppose that the son carried the correspondence with him as "official archives" upon the removal of the seat of residence to Tell El-Amarna. Most important among these are the letters which refer to the marriage of Dushratta's daughter to Amenophis III. From Egyptian sources, we already knew that the latter had married an Oriental princess. We now encounter a most remarkable confirmation of this testimony, and in the Tell El-Amarna tablets we have a great part of the correspondence in which the details of the marriage, including what appears to be the marriage dowry, are settled. Dushratta in this correspondence addresses Amenophis invariably as his son-in-law. It may not be uninteresting to give also the introductory formulas used in this correspondence, which varies somewhat from the one above quoted:

"To Nimmuria (surname of Amenophis III.), the great King of Egypt, my brother and son-in-law, whom I love and who loves me, speak as follows: Dushratta, the great King, the King of Mitanni, thy brother and father-in-law, who loves thee. Peace to me; to my brother and son-in-law peace; to thy house, thy wives, thy nobles, thy men, thy chariots, thy horses, thy land and all that belongs to thee, peace in abundance."

It will be noticed that the message is not directed to Amenophis, but to the messenger who is asked to make the announcement that follows to the Egyptian King. The tablet in such a case serves the purpose of a memorandum for the messenger, who is supposed to execute his commission by word of mouth. Dr. Winckler of Berlin is of the opinion that this indirect form represents the older and Babylonian method of sending a message, and that the direct one is due to an innovation introduced by the Assyrians. It is hardly possible to pronounce definitively on this point at present, but the suggestion is an interesting one. Of the land of Mitanni we know almost nothing. A notice in the inscription of a great Assyrian King who ruled in the twelfth century before this era, enables us to fix its position approximately in the northwestern corner of Mesopotamia. The same notice informs us that it was a favorite hunting-ground. It is interesting to note that Amenophis III., too, was very fond of the chase. On a scarabæus he tells us that he slew over one hundred lions by his own hand. We also know from Egyptian sources that he visited Mesopotamia. It has been ingeniously conjectured that, while chasing lions and bulls in the forests of Mitanni, he met the lady of his love at the court of Dushratta.

Egyptian monuments tell us that the name of this princess whom Amenophis married was Thi or Thna, which fact likewise receives a most striking confirmation from another of the Tell El-Amarna tablets, in which a woman, Ti, is incidentally referred to as the mother of Amenophis IV. The alliance between the royal families of Egypt and Mitanni led to further marriage negotiations in the succeeding generation. This same Dushratta, in another tablet, sends a despatch to Amenophis IV., in which he states that Manê, his "brother's grandson," is desirous of winning the affections of a fair Egyptian, who was none other than the daughter of Amenophis IV. Dushratta hopes that the King will look favorably upon the petition, and that he will grant Manê permission to pay a visit to the Egyptian court. He also recalls the amicable relations which have hitherto existed between the two kingdoms, and, in addition to sweet words, sends his Egyptian colleague handsome presents and large quantities of gold. He also hints that there is more to follow if Amenophis consents to the marriage. Politics in those early days, it will be seen, did not differ so very much from modern conditions.

In addition to Burnaburiash and Dushratta, there are quite a number of other correspondents who send messages of various kinds to the Egyptian court. Among these, the most important, again, so far as ascertained, is a ruler of the country of Alashia. Several despatches of this King have been found, but unfortunately in all the name of the ruler is broken off. As for the country itself, this is the first mention of it that has ever been met with. From the contents of the letter, however, it is evident that it must have been a dominion of no little importance. This King, too, addresses Amenophis as his brother, refers to his wives, nobles, horses, and chariots, and evidently was on a footing of familiarity with the mighty Pharaoh. So far as they have been deciphered, the letters speak chiefly of an exchange of commodities between the two rulers.

Finally, there are to be mentioned the reports to Amenophis from Egyptian governors and officers stationed in various quarters. Little has as yet been deciphered of this division of the find, but it is more than probable that the reports contain information which will enrich our knowledge of the political history of ancient Egypt. The names of the places whence the despatches are sent excite the greatest interest. Among these we read Sidon, Jaffa, Megiddo, Ascalon, Byblus, and other places on the Phœnician coast and in the interior of Palestine.

An exceedingly curious and noteworthy circumstance is the fact that this correspondence with the Egyptian court should have been carried on in Babylonian, and not (as we had reason to expect) in Egyptian. That Burnaburiash should make use of Babylonian may be natural, but that Dushratta, whose language was certainly far different, probably not even Semitic, should do so, is rather surprising. This, together with the fact that the Egyptian officials stationed in Phœnicia and elsewhere also employ the Babylonian language, shows conclusively that its use and knowledge were not limited to the land where it arose. It would seem, indeed, though the conclusion appears somewhat hazardous, that Babylonian occupied an important position as the language of diplomatic intercourse among the Powers of antiquity, much as French did until recently among the European Powers, and as Latin did in the Middle Ages. There is no doubt, moreover, that these tablets were actually read by the Egyptian officials into whose charge they were given. Many of them still show traces of marks made by the Egyptian scribes to assist them in separating the words from one another. Others contain annotations and memoranda certifying to the receipt of the despatch and the date of its arrival, but written in the ordinary Egyptian characters and language. So one of these subscripts informs us that a certain letter was received at the time that the court was in Thebes, mentioning the year of the King's reign and the day of the month,

Another proof that the Egyptians devoted themselves to the study of the Babylonian cuneiform is furnished by a tablet with mythological contents found in the Tell El-Amarna collection. The tablet is marked by dots of Egyptian origin that separate the words, and evidently served the purpose of a "reading-book" used by some scribe while acquiring the very difficult and intricate cuneiform system.

There is little reason to question now that the soil of Egypt contains further treasures such as have been found at Tell El-Amarna. The discovery of this remarkable correspondence is as rich in the promises it holds out for the future as in the direct gain which results from it. A few years ago several cylinders inscribed with cuneiform characters were found in Egypt which, upon examination, proved to be documents deposited by the great Nebuchadnezzar in the sixth century while in Egypt, in commemoration of his campaign against the land of the Nile. Between the days of Burnaburiash and those of Nebuchadnezzar the contact between Mesopotamia and Egypt, now more close, now less so, now of a friendly, now of a hostile character, was never entirely broken. We may confidently look forward to having one day in our possession tolerably complete records of this contact.

MORRIS JASTROW, JR.

FRANCE UNDER THE OLD REGIME.

PARIS, April 18, 1889.

I MENTIONED at the time it was published a volume by the Vicomte de Broc on 'France under the Old Régime, its Government and Institutions.' In this volume, M. de Broc undertook to give an account of the political and administrative state of France under what we familiarly call the "ancien régime." He now gives us a second volume, in which he undertakes to paint the manners, the intellectual and moral state of the country, before the Revolution. He is not a mere "laudator temporis acti," but he surveys French society impartially, and shows its defects as well as its qualities.

To understand a society well, we must first look at its education. In the old times, education varied according to the class into which a child was born. There was no uncertainty, no vocation: a young man was expected to do as his fathers had done; a nobleman could only become a soldier or enter the Church. The girls were generally educated in a convent, whether they belonged to the nobility or to the bourgeoisie. M. de Broc gives some curious facts touching the cost of their education. The 'État de la Ville de Paris' in 1757 has the prices of board (*pension*) in the convents of Paris; the board varied between 400 and 600 livres, not including the dresses, light, fuel, or washing. There was, besides, 300 livres for a maid when she was required. In the fashionable convent of Penthemont (where the Princesse de Ligne was educated—see the 'Histoire d'une grande dame au dix-huitième siècle,' by Lucien Perey), the price of board went as high as 1,000 francs. Girls belonging to the financial and judicial world were more moderate: they paid from 250 to 350 livres in various convents, such as the Dames de Sainte-Maria, the Cordelières, the Chanoinesses de St.-Augustin, etc.

For a century, Saint-Cyr received the poorer girls belonging to the nobility; they were 250 in number, and had to prove four degrees of nobility at least, on the paternal side. Would you have an idea of their life? They got up at six in the morning, heard mass every day at eight, worked till twelve, the dinner hour; the recess lasted till two, when the work began again till six o'clock; they went to bed at nine. A very severe life, as you see—quite as severe as the life of the boys educated in the colleges of the Jesuits. There were four classes at Saint-Cyr, and the complete education included grammar, catechism, sacred history, general history, geography, mythology, music, dancing, French literature. You will note this element of mythology, now almost completely wanting in all our systems of education. Many girls learned Latin and philosophy; Mme. de Sévigné and Mme. de Lafayette knew Latin, Mme. de Grignan was familiar with Descartes; Mme. Dacier translated Homer; later we see Mme. Du Châtelet, the friend of Voltaire, studying Newton. In his "Femmes Savantes" Molière attacked pedantry in women, not real learning. The "Précieuses" had made themselves ridiculous, but Fénelon, in his 'Éducation des filles,' insisted upon the necessity of a solid education for women.

It is not so easy to defend the *ancien régime* on the subject of marriage. The seventeenth and eighteenth centuries did not allow much choice in this matter; the marriages were always arranged by the families, and treated as mere matters of business. The Duc de Nivernais was fourteen years old when he was married to a daughter of the Comte de Pontchartrain, aged fifteen. I could cite hundreds of such examples. When Mlle. de Sully was presented to Du Moulin, for the celebration of her marriage with M. de Rohan, she was so small that Du Moulin asked if she was presented for baptism. There are amusing details in Dangeau, in Mme de Sévigné, in Bussy-Rabutin, on such marriages between mere children. It is easy to imagine that these were not always happy. The Princess Palatine wrote in 1721: "To love one's children is a very common thing; to love one's wife is completely out of fashion. . . . Among people of quality I hardly know one example of affection and fidelity." The Princess was, perhaps, too severe, as well as Montesquieu, who writes in his 'Lettres Persanes': "Here, in Paris, a husband who loves his wife is a man who has not sufficient merit to make himself beloved by another." Dancourt, the dramatic author, says in his 'Bourgeoises de qualité' (1692): "Jealousy is a bourgeois passion which is hardly known among people of quality."

Paternal authority was much greater in old times than it is in our century; the father was the Roman paterfamilias, and had an almost despotic power. In the 'Roman bourgeois,' one of the rare novels which describe the inner life of the old bourgeoisie, you may read: "We were seven children in the house, all wearing beards, but the boldest would not have dared to cough or to spit in the presence of my father: a word of his made the house tremble." Chateaubriand, in his 'Mémoires d'Outre-tombe,' describes graphically the terror which he felt in presence of his father in the old castle of Combourg. The right of primogeniture was never as absolute in France as it is even now in England; all over the South, which had kept the Roman law, it did not exist. The custom of Paris gave to the eldest a separate portion, and besides, two-thirds of all the remainder if there were two children, one-half if there were more. The customs of Maine, Anjou, Tours, Loudun, Poitou, Blois, Angers, gave to the eldest two-thirds of the estate.

M. de Broc gives curious details on dress under the *ancien régime*, and on the mode and expense of living. His documents are, on this last point, the budget established by Mme. de Maintenon, in 1679, for her brother, the Comte d'Aubigné, who had just been married, and, at a later period, the budget of the painter, Joseph Vernet (taken from Léon Lagrange's biography of Joseph Vernet). Mme. de Maintenon was an admirable housekeeper. "Your eating expense (*dépense de bouche*) must not exceed six thousand livres a year [and she reckons four lackeys and two coachmen in the household, as well as three women and a valet]; let us add a thousand livres for the dress of Mme. d'Aubigné, as, with what I give her, it will be quite enough; then a thousand livres for the wages and dresses of the domestics; a thousand for the rent of the house; three thousand for your clothes, the opera, and sundry expenses." This amounts in all to 12,000 livres, for a household of twelve people. Joseph Vernet lodged in the house, and, having no rent to pay, spent about 10,000 livres. In all the budgets of old times, the dress of the gentleman enters for a larger sum than the dresses of the lady. The servants are more numerous and are satisfied with much smaller wages. M. and Mme. d'Épinay, when they married, had immediately sixteen servants. Among the small bourgeoisie the servants were almost exclusively women, and Molière's plays show us what important members of the household these women often were. They remained in the same family all their lives, and became almost members of it. The *menu* of a family dinner was, in 1740, very much what it is now. Brillat-Savarin gives us, in his 'Physiologie du Goût,' such a *menu* for ten people, and it could serve now under the same circumstances. Some fashions have changed: the plates were only changed three times during a dinner—after the soup, an invariable part of a French dinner, after the second course, and during the dessert, after the cheese.

Life in Paris has often been described. The 'Tableau de Paris,' by Mercier, is still found in a complete library. M. de Broc gives us, after the description of the capital in past times, a monograph on life at court, at Versailles; he shows us life in the provinces—first in the cities, afterwards in the châteaux. The great events in the cities were the solemn "entrées" of princes and governors; many of them were made the subject of fine publications, with engravings, which are now much valued by bibliophiles. Life has always been deemed more agreeable in Paris than in the provinces; the very word "provincial" savors of contempt. Hear what La Bruyère says of small cities in general: "I approach a small town and I am already on the height from which it is discerned. It is on the slope; a river goes round its walls and then enters a fine meadow; a thick forest protects it against the north wind. I see it in so good a light that I can count its towers and its churches; it looks as if it were grouted against the side of the hill. I say to myself: 'What pleasure it must be to live under such a beautiful sky and in so delicious a place.' I go down into the city, and I have not slept two nights in it before I feel like all its inhabitants—I want to get out of it." Lesage, in his "Turcaret," criticises the small divisions and jealousies of the provincial towns.

As for life in the châteaux, we do not possess many documents. Mme. de Sévigné describes minutely her daily existence at the Rochers, in Brittany, in her charming style: "Such is the rule of our convent; we inscribe over the door: 'Holy Liberty,' or 'Do as you like.' No numerous gatherings of people, no festivities." "When I am out of Paris," says she, "I want nothing but the country." She is not afraid of solitude, she dislikes importunate visitors. Very different was the life led at the magnificent Château de Grignan, but the Comte de Grignan was governor of his province and had

to entertain many people: he kept open table all the time. There is nothing in our modern life which can equal in magnificence the existence of the Duc de Choiseul at Chanteloup. We have on this subject an excellent document in the letters of the Abbé Barthélemy to Mme. du Deffand. It must be noted, however, that, with all this magnificence, there was not much of what we now call comfort, and the same may be said even of Versailles. We find curious notes also on the Château de Brienne in a book by M. Babeau (Troyes, 1877). This château was inhabited in the last century by Comte Loménie de Brienne. There were almost always as many as forty guests at the château, each of whom had a complete apartment. Babeau has described also the Château de la Chapelle-Godefroy, inhabited by Orry, the Controller-General of the Finances, and by Jean de Boullogne, after him, who was also Controller-General. Diderot shows us the existence of Baron d'Holbach at Grandval, in his letters to Mlle. Voland, as well as the life of Mme. d'Épinay at Chevrette. Arthur Young, in his 'Travels,' says at Aiguillon, which had been rebuilt by the Duc d'Aiguillon, one of Louis XV.'s Ministers, after he fell into disgrace: "Exile forces the French nobility to do what the English do for their pleasure, to reside on their domains and to embellish them"; but he is found reversing this judgment at Liancourt, in the Duc de Larochefoucauld's house: "I recognized at Liancourt the falseness of all the views I had formed before my journey concerning a French country-house. I expected to find a copy of the capital, I was in error. Life and occupation resemble much more those of the residence of an English lord than people would generally imagine. You find tea for your breakfast; then you can ride, hunt, look at the plantations, the gardens; you dine at half-past two instead of the old hour of twelve; music, chess, all the other amusements of a drawing-room help you to spend the remaining hours, as well as a library of seven or eight thousand volumes."

M. de Broc ends his interesting volume with details on the modes of travelling in France, on the post-office, the newspapers, and the country theatres in the provinces during the period which preceded the French Revolution.

Correspondence.

THE EXCAVATIONS AT DELPHI.

To the Editor of The Nation:

Sir: I have just received the *Nation* of March 28, containing Mr. Stillman's letter on the proposed excavations at Delphi. Mr. Stillman says "that if the directors of our School of Hellenic Studies at Athens understood the position of the proposed excavations at Delphi, it would not be possible for them to enter into the proposed bargain with the Delphini for the privilege of uncovering what may chance to remain of the appurtenances of the Oracle." I feel bound to send a brief reply to Mr. Stillman's letter, as being one of the directors of the American School of Classical Studies at Athens, and as having taken some trouble to "understand the position of the proposed excavations at Delphi." I have had direct sources of information *from all sides*. At this moment I have in my possession the state papers relating to agreements and valuations, and I returned from Delphi last week, where, in company with Mr. Rolfe of this School, with all the papers before me, I studied the site and had communication with the representatives of the people of Delphi.

I am fully convinced of Mr. Stillman's good intentions, and, in many respects, sympathize with his views; but he ought to have taken a little more trouble in ascertaining the facts. I do not wish at the present moment to enter into the whole question of excavations at Delphi; but I may mention the fact that Mr. Stillman is wrong when he asserts that "the price of the village has been raised from about $25,000, which is the highest value that can be put on it, to $80,000." I have before me the official valuation made by the French surveyors, as well as that made by the Greeks, and I can assure him that their estimate is considerably more than double that amount. He is furthermore misinformed concerning the action of the other schools. The German School has taken no steps whatever in the matter, and has neither "refused to enter into such competition," nor "has it recognized the moral claims of its sister institutions." But, what is perhaps more to the point, Mr. Stillman might easily have informed himself of what my own action in the matter was before rushing into print. My colleague, Professor Tarbell, was in Athens at the time Mr. Stillman wrote his letter, and he could have relieved himself of the necessity of surmise or of forming hasty conclusions by simply inquiring of my colleague what the American School had really done. He would then have found that, two months before his arrival at Athens, I was busily engaged in guarding the interests of pure scientific inquiry and of national courtesy with reference to the claims of the French School, in the very spirit which he now endeavors to contrast with the misguided blindness of our course of action.

I cannot enter upon the question as to what happened before my directorship, which began this last winter; and I must leave it to those who were themselves concerned to show the position of the School in previous years. But what I feel bound to do now is, to give the outline of my own action in the matter. Prior to my arrival here last December, I had not the slightest idea of the possibility of our taking up the excavation of Delphi. I was under the impression that the French School was about to begin. The day after my arrival the Greek papers announced that I had arrived in Athens, "sent by the American Government to enter upon negotiations for the excavation of Delphi." This was the first intimation I received. I was then more credibly informed that the right to excavate Delphi had been offered to the Americans. I thereupon looked into the matter on all sides, and finally came to the conclusion that, whatever our claims might be, we ought to waive them all if there was any possibility of the French School undertaking the excavations within a reasonable period. This attitude was entirely based upon a feeling of scientific and national courtesy. I took definite steps, as a responsible director of the school, to express these views. Some time has elapsed since then, and I have realized, on the one hand, that a large portion of my countrymen in America, who have the interests of science and of this School at heart, are strongly desirous of seeing the excavations at Delphi carried on by the American School; while, on the other hand, I have been informed on the best authority that there is no reasonable prospect of the right of excavating being granted to the French, but that it will be given either to the Americans or to the Greek Archæological Society. From that moment the question of excavating this the most famous of ancient Greek sites lay between the Greek Archæological Society and ourselves, we having a prior claim.

I am now, and shall in the future be, guided by the following considerations:

(1.) Delphi *must* be excavated in the interest of science.

(2.) The excavations must be carried on on a large scale to be of real value. (I may write another letter on this question, in which light may be thrown upon some of Mr. Stillman's remarks concerning the "price," or rather the cost.)

(3.) These excavations ought for many reasons to be undertaken soon. If the excavation of the whole site had been carried into effect twenty years ago, the cost would have been much lower.

(4.) If it were possible for the French School to do the work immediately, they ought to have first claim; if not, the interest of science ought to be paramount, and every true French scholar would be gratified at the idea of this important work being undertaken, and he, with the rest of the civilized world, will be grateful to whosoever brings this about. And if this should be carried into effect by Americans, to them will come the gratitude.

Your obedient servant,

Charles Waldstein.

American School of Classical Studies,
Athens, April 17, 1889.

THE AMHERST POSTMASTERSHIP.

To the Editor of The Nation:

Sir: Your selection of the postmastership at Amherst, Mass., to point a contrast between President Cleveland and President Harrison (p. 335 of your last issue) is so inappropriate that I cannot refrain from stating the actual facts. In reality, the course of Mr. Harrison respecting Mr. Couch and the course of Mr. Cleveland respecting Mr. Couch's predecessor are exactly alike. As a supporter of Mr. Cleveland, I am sorry to have to say this, but the facts are as follows. It should be premised that neither case is a case of removal; in each the term expired and the holder was not reappointed.

Mr. Couch's predecessor had been appointed eight years before, at the instance of President Seelye, then member of Congress. His appointment was, in an unusual degree, in accord with the principles of civil-service reform. A vacancy suddenly occurring, he was appointed not only without his solicitation, but without his knowledge. What you say of Mr. Couch was equally true of him, that "he had been a most faithful public servant, and had conducted the office on the principles of civil-service reform, retaining the assistant of his predecessor." The Springfield *Republican* said that, in the matter of accounting with the Department at Washington, he had stood higher than any other postmaster in Massachusetts, save one. It is equally true that "his reappointment was asked for by nearly the entire faculties of the two colleges and by the leading business men, including," if I remember rightly, "the President of the National Bank and the proprietors of the mills." The signers of his petition were the recipients of nine-tenths of the mail-matter received by the office, and included both Republicans and Democrats of prominence. At that time, as now, the first test of what the new President would do under such circumstances was presented in this case. The politicians of the victorious party insisted upon a change, and Mr. Cleveland appointed Mr. Couch, then Chairman of the Democratic Town Committee. Both Mr. Couch and the new appointee are eminently fit men, and neither one is at all the typical party-worker. The only objection that could be made in either

case is the radical objection that, in the interest of the service, the best appointment to make in such cases is, almost always, a reappointment.

The non-partisan observer will perceive that the disadvantage of the comparison rests, if anywhere, on President Cleveland. The former case elicited no protest from the *Nation*; if the latter is felt to call for one, it at any rate cannot justly take the form of a contrast.—I am, sir, very respectfully yours,

J. Franklin Jameson.

Providence, April 27, 1889.

[Our files will bear witness to our faithfulness in holding up to public censure the current violations of civil-service reform principles and pledges by Mr. Cleveland's Postmasters-General. They will also show that we conceded the justice of President Cleveland's claim that a wholly partisan civil service should be reduced to one in which the political elements were fairly mixed and equalized, though this necessarily involved the turning out or replacing of some worthy officials. Such an equalization would, of course, have invited the reaction we are now witnessing even if it had not passed the middle line as to numbers, and had, in new appointments, scrupulously adhered to the business (or "public office a public trust") principle, as appears to have been the case with the Amherst postmastership, and not to the spoils principle. Still, without ignoring the real abuses of the late Administration, we hold that the circumstances of the Republicans' return to power were very different from those of Mr. Cleveland's accession as respects the civil service. Moreover, the Republican party asked last November to be reinstated in the Government expressly in order to correct and suppress the abuses perpetrated under Mr. Cleveland; and President Harrison, in his letter of acceptance, solemnly put himself in line on this chapter with the Chicago platform. Both the party and the President must now be tried not by the shortcomings of the Cleveland Administration, but by their own professions.—Ed. Nation.]

PROHIBITION IN IOWA.

To the Editor of The Nation:

Sir: Will you permit me to correct what I believe to be an erroneous idea in the communication from "A Travelling Man" in your issue of April 25? He says, "The aim of prohibition is, I believe, to keep those who crave liquor from getting it." The gentleman in question may have been led to think that such was the principal aim of prohibition, by the fact that some who advocate prohibitory laws take so narrow a view of this great question. To the majority of prohibitionists, however, this is but a minor point, and becomes insignificant when compared with the far more important purpose of saving from the evils of liquor-drinking our young men and young women, not only of the present, but of all future generations.

There are very few, even of the most radical prohibitionists, who will not readily admit that it is next to impossible to entirely prevent old topers from getting an occasional drink, even though the laws may be most carefully formed and rigidly enforced. This is especially true in localities where foreigners are in the majority. The greatest good which the far-seeing prohibitionist hopes to obtain from prohibitory laws is that, in those places where public opinion is in favor of the law, not only the young may be saved, but many who are already slightly addicted to the use of intoxicants may also be reclaimed; and that in those places where public opinion may not favor prohibition, liquor-selling may be placed under the ban of the law, and thus save that large number of young people whose pride will prevent them from having anything to do with a traffic carried on in open defiance of the law. It is needless to say that there is a large number of such young people, who, under other circumstances, would see no harm in visiting a saloon and drinking there when they see the authorities (a body of men which, in smaller places, often includes the leading church-members and most highly respected citizens) foster and protect the dram-shops.

I may also add that "A Travelling Man" rather overreaches himself when he says: "I have known men to drive forty miles to town for a drink." Any one who is acquainted with the State of Iowa knows very well that in no part of the State can one drive forty miles without passing a large number of villages or small towns. Knowing that in evading the law the wiles of the toper are legion, and knowing also that if there is any liquor to be had he is sure to know about it, it is certainly pretty good evidence that there are parts of the State of Iowa (that included within a radius of forty miles, or an area larger than eight average counties) where prohibition is a *complete* success.

Having lived in Iowa over twenty years, and knowing something of the working of the prohibition law, I think I am justified in saying that there are many other parts of the State where the same condition prevails; in other words, that the prohibition law in Iowa is, except possibly in a few river towns, as well enforced as any other law in the State.

Yours truly, Selby A. Moran.

Ann Arbor, Mich., April 29, 1889.

HIGH LICENSE IN PENNSYLVANIA.

To the Editor of The Nation:

Sir: Being a constant reader of the *Nation*, I am annoyed with your treatment of the liquor question, as giving the impression of having made up your mind first and seeking evidence afterwards, in true theological style. Last year's restriction of license was carried so far that back-door drinking was common (there being three drinking-places without license near our works), patent-stopper bottles for bottling at home became a prominent feature at grocery stores, and many of the saloons were enlarged and overcrowded—some of the proprietors making enormous profits out of their monopoly. This year promises to be much worse; the courts apparently being anxious to show the public the danger of giving one man so much power as is given by the Brooks Law.

In the *Nation* of April 25 you say, "The single fact that there are, in a city like Pittsburgh, eleven wards almost entirely without a liquor saloon, is itself an unanswerable argument in favor of the high-license principle as an effective agency for restricting the liquor traffic." High license may be good, but it seems to me that the above is almost self-evident proof that it has been carried to an absurd extreme. With tariff, oleo., liquor, dressed-beef, prison-labor, etc., agitations in the air, there is danger of the law-breakers becoming the majority, and therefore more respected than the law-makers. I am sorry to see the *Nation* in such unsuitable company.

Respectfully yours, W. Walker.

Pittsburgh, Pa., April 29, 1889.

[We do not seek evidence "afterwards," but all the time, and we are obliged to our correspondent for what he offers. We are all liable to err in thinking that the results of *any* system of restricting the liquor traffic will be immediately demonstrable; but prohibitionist and high-license advocates ought to be agreed in accepting the diminution of saloons—*i. e.*, of the frequency of temptation—as a gain to the community. Either policy tends more or less to promote illicit selling and drinking.—Ed. Nation.]

THE VOTE IN SALEM, MASS.

To the Editor of The Nation:

Sir: I wish to call your attention to an error in your issue of April 25. In speaking of the vote in this State on the prohibitory amendment, you say: "Salem is the one place of considerable size which went that way [*i. e.*, for the amendment] with a sweep by the remarkable vote of 2,009 to 879." Now, while you have given the exact figures, you have just reversed them, the actual vote being 879 *for* the amendment and 2,009 *against* it. Your showing would speak but poorly for the common sense of the people of Salem.—Yours very truly,

H. P. Peirson.

Salem, Mass., April 27, 1889.

THE RHINES VOTE-RECORDING MACHINE.

To the Editor of The Nation:

Sir: In your issue of the 25th inst., your correspondent "J. H. W." (whose position as an authority on ballot reform in this country is well known to all those familiar with the literature of the subject) has made very just and forcible objections to the Rhines machine as at present constructed; but it occurs to me that other objections may also be made.

The Constitution of almost every State requires elections to be by ballot. According to the dictionaries, this word may mean not only a piece of paper, but (as originally) a little ball, or anything else used for casting a vote secretly; and we may fairly interpret the constitution as not confining the citizens to the use of paper ballots. Unquestionably, however, when these constitutions were adopted, it was meant that the ballots, of whatever material or construction, should be cast separately by each voter, or by an election officer for him, into a box; and a machine by which each voter presses certain buttons, and by means of unseen machinery records his choice in the form of a particular number in a particular column on a long strip of paper, is certainly not within the letter of these constitutions. Whether it be within their spirit, will be an open question till it is settled by some court of last resort, and in the meantime it is open to very grave doubt. In Pennsylvania, where the Constitution is peculiarly explicit in regard to identifying the ballots by numbers, and even, oddly enough, by an endorsement of any voter's name who may wish it, a constitutional amendment would undoubtedly first be required.

There is no provision in the Rhines machine for voting for any one not nominated, nor do I see how such a machine can possibly provide for this, as has been done, I believe, in all the ballot-reform bills introduced in the various

legislatures, by directing a sufficient number of blank spaces to be left on the ballot, so that names can be inserted. It may be argued that the right of voting for any one not nominated is of little value; but as our State constitutions stand at present, every voter has a right to vote for whom he pleases, and a law compelling him to vote only for candidates who have been nominated in a certain manner, and a certain length of time before the election, would probably be unconstitutional. Besides, in the case of ward or township officers, and particularly in the case of division election officers, the right to combine in an independent movement after the time for nominations has passed may be a very valuable one.

The possibility of the machine getting out of order during an election, as well as of its being secretly arranged beforehand by the officers in charge so as to produce fraudulent results, suggest objections that may perhaps have some foundation. At the same time, the machine is a most ingenious one, and if it should really be possible to secure a free and pure ballot by such a contrivance as this, American inventiveness will have given the world the greatest of many gifts. CHARLES C. BINNEY.

PHILADELPHIA, April 27, 1889.

THE HIGHER LAW OF LEGISLATURES.

TO THE EDITOR OF THE NATION:

SIR: I am aware of the impropriety of attempting to discuss a grave constitutional question within the narrow limits allowed an occasional correspondent. It was expressly conceded in my former letter that many excellent authorities might be found for the conclusion announced by Prof. Bryce. To institute a comparison between the conflicting cases was not my purpose. I desired to assert, and to emphasize by such citations as I found at hand, the fact that a conflict exists, and that, in my humble opinion, the prevailing doctrine is opposed to the conclusion of Prof. Bryce.

It must be confessed that the English Parliament is, at present, more apt to respect the rights of an individual than an American State legislature. This superior consideration for private right is due, however, not to the compelling authority of Magna Charta and the Petition of Right, nor to any regard for what is called the English Constitution, but to the superior honesty, ability, and fairness of the members of Parliament. Both of the famous statutes referred to were directed against the King and the Executive. Like other laws of Parliament, they may be repealed or disregarded by Parliament. The memorable judgment of Lord Coke in Dr. Bonham's case—"Sometimes the common law will control acts of Parliament, and adjudge them to be void; for when an act is against common right and reason, or impossible to be performed, the common law will control it and adjudge it to be void"—declared rather a rule for the construction of statutes than a principle for their control. While this judgment received the sanction of two of his successors, it has repeatedly been repudiated, and can no longer be regarded as the "law of the land." It must also be remembered that Sir Thomas More was beheaded because he affirmed in a private conversation that there were things which no Parliament could do: "For example, no Parliament could make a law that God should not be God; no more could it make the King the supreme head of the Church." Moreover, the rolls of Parliament are full of laws which violate what every American—yes, and Englishman—would hold to be self-evident principles of right and justice. Passing over the laws adopted in times of religious or political excitement, when men's minds were so disturbed as to be incapable of justice, the oppressive power of Parliament may be illustrated by the infamous law adopted in the time of Elizabeth for the regulation of labor (5 Eliz., chap. 4). This provided that every person under the age of thirty years, not having forty shillings a year, should be compellable to serve as a yearly servant in the craft in which he was brought up; that all persons between fifteen and sixty years, not otherwise employed, should be compellable to serve in husbandry; that a servant unlawfully quitting his employment should be imprisoned; that servants should not leave the city or parish in which they were employed, without a testimonial, under penalty of imprisonment; that a master taking a servant without a testimonial should be fined.

This law also established an assize composed of the county justices, with power to define the hours of work which should constitute a day's labor, and fix the rate of wages to be paid; and, with a view to enforcing the observance of the schedule adopted, provided that any master who paid more than the prescribed wages should be fined and imprisoned, and that if workmen combined to raise wages, they might be hung.

When it is remembered that the average rate of wages established by these assizes was about ten cents a day, and that universal misery was the result, one may well question the efficacy of that spirit of the common law to which Lord Coke appealed. By what express limitation would such a law be declared unconstitutional in America? (See Rogers's 'History of Wages.')

This law was in force at the time of the Declaration of Independence, at the time when Lord Thurlow declared an attack on the charter of the East India Company to be an "atrocious violation of private right, which cut every Englishman to the bone," and Mr. Burke, in the fervor of his magnificent oratory, pronounced the rights of man to be indeed sacred things, and declared that "A formal recognition by the sovereign power of an original right in the subject cannot be subverted but by uprooting the holding, radical principle of government and even society itself."

It is hardly necessary to adduce other proofs that even a parliament of Englishmen, however thoroughly imbued with the sentiment of justice, is not to be trusted with the liberties of the people. A hundred instances of wrong will recur to every reader of history. Ireland's discontent is the heritage of a people for long years subjected to every form of outrageous oppression which the ingenuity of selfishness could devise. The Americans who made this Commonwealth remembered these things. To guard against them, they established constitutions wherein were recited the purposes for which governments are established, chief among which was the security of life, liberty, property, and the pursuit of happiness. These instruments declared also the scope and limitations of the various departments of government, and confided to the courts the duty and right of interpretation. To deny to the courts the power to avoid a law which manifestly and flagrantly disregards the purposes for which a constitution is adopted, while conceding to them the right to enforce the limitations expressive of, and necessarily incompletely expressive of, those purposes, is palpable, monstrous folly. Danger to the individual cannot be involved in this doctrine. The courts may restrain, they cannot initiate oppression.

In reply to one of my critics, I submit the following cases in which laws have been actually annulled by the courts, although not forbidden by the express provisions of any constitution. They illustrate the necessity as well as the reasonableness of the doctrine under consideration.

A law imposing a tax for a private purpose (25 Iowa 547, 20 Mich. 473, 103 Mass. 102, 60 Maine 128).

A law imposing a debt on a municipality or person which it or he had not contracted (16 Mass. 83, 51 Ill. 33, 51 Pa. St. 22).

A law forbidding a man to sell his property lawfully acquired (13 N. Y. 381).

A law releasing a debtor from the effect of a judgment (3 Vt. 179-360).

A law suspending the statute of limitation in favor of a particular claim (11 Mass. 398).

A law requiring a person in the possession and enjoyment of property to begin a suit to establish his title (11 Minn. 499-866).

A law appointing an agent for a municipality, without its consent, with power to buy and sell on its account (31 Vt. 233).

A law authorizing a personal judgment against a non-resident without personal service (95 U. S. 714).

A law requiring the owner of realty to enjoin a person proposing to do work on his property, and that otherwise the fact that the work was done should be conclusive evidence that it was done with the owner's consent (1 Lawyer's Reps. 777).

A law providing that a person having color of title to land, whether in possession or not, who paid taxes for a series of years, should have a legal and good title (18 Ill. 506).

A law divorcing a husband and wife, and granting alimony to the latter (4 Har. and McH. 477).

Yours truly, I. H. LIONBERGER.

ST. LOUIS, April 29, 1889.

THE ADMINISTRATION OF JUSTICE IN SOUTH CAROLINA.

TO THE EDITOR OF THE NATION:

SIR: I have watched with interest and concern the discussion in the last few numbers of your paper on the subject of "Negro Convicts in South Carolina," and am moved to this obtrusion by the conviction that I can remove some of the misapprehensions under which you are laboring.

In limine, let me say that in your editorial of the 25th inst. you overlook entirely the suggestion made by Prof. Alexander, that "the purpose of the [Governor's] Statement is to inform the public as to whom he has pardoned, and in the briefest possible way of the ground of his action. He naturally mentions only the mitigating circumstances. The impression, therefore, is apt to be made that these persons were unjustly punished in the first instance. But if one will only take the trouble to investigate, he will find that there is quite another side to the picture than that presented in petitions." And you proceed to produce other instances, and draw other inferences from the bare statements accompanying the Governor's report, and without any other knowledge of, or, so far as appears, any inquiry into, the facts of the case. With this I should have little concern, except that you make your deductions the premises on which you affirm "that South Carolina juries convict negroes where legal proof of guilt is confessedly wanting, and judges and Governor support them in such disregard of all rules of law"; and again: "Public sentiment demands that a negro who has the misfortune to be suspected of crime shall

be sent up until the suspicion is forgotten, and somebody asks the Governor to let him out."

The Q. E. D. of your articles seems to be that the law is not administered fairly, and is used for the oppression of a class and a curtailment of its liberties. This is a grave charge to bring against any community, and when it can be refuted by a simple statement of facts, I feel it my duty to present them to you, and, through your widespread and influential paper, to lay them before the public.

It is, of course, well known to you that the laws of this State make no discrimination for or against the colored citizen; and I confess that, knowing the negro as I do, I sincerely regret that such discriminations cannot be made. The difference of moral stature is such as to make it hard indeed to punish him, by a procrustean code, with the same severity as the white man for certain crimes, of which, without doubt, he has not the same moral perception—but this merely in passing. It is in reference to the administration rather than the enactment of our laws that I am able to speak from experience, having been for nearly thirteen years the prosecuting attorney of a large circuit in the State, and one containing a great majority of colored citizens. And I state generally that, during these years of service, I do not recall a single instance wherein race prejudice has been to any degree a factor in the conviction of a negro. We are not unlike other people, and American people, and prejudices do exist, especially with the illiterate and uninformed; but that it impresses itself on the administration of justice in the manner you imagine, cannot be substantiated. Juries are proverbially uncertain, and justice must sometimes miscarry; and while I have known instances in which white men have been acquitted for crimes against negroes, who, in my judgment, should have been convicted, yet the same failure of justice occurs in cases wherein the offence occurs between persons of the same race, and history shows that it is more or less prevalent all over the civilized world. The proposition which I dispute here is, that, under the administration of our laws, negroes are convicted because they are negroes, and without the same regard to the weight of the evidence as is exercised in regard to white men.

It would take some time, but I fancy little difficulty, to get the full statement of each case you cite, and show that there were facts, and controlling facts, in each case which do not enter into your reasoning; but that has been already pointed out by Prof. Alexander. I will only advert to one of them, which happens to have come under my especial observation. I refer to the case of Marcus Horlbeck, cited in your article of the 25th inst. Your criticism of that case is:

> "The legal enormity of this case can hardly be described. A jury, sworn to try the prisoner according to the law and the evidence, deliberately plots to secure the imprisonment for life of a man of whose guilt they have grave doubts; and Judge Hudson lends himself to this scheme . . . and the Governor complies. . . . It is an elementary principle of the criminal law, which it is inconceivable that the judge did not impose upon the jury, that unless the jurors are convinced beyond a reasonable doubt of the guilt of the prisoner, a verdict of acquittal must be rendered; and above all, in a capital case, the prisoner is entitled to the benefit of every reasonable doubt."

When this case occurred, our citizens were startled by its horrible and disgusting details. The prisoner was a well-known pimp in the lowest slums of iniquity in the city—a locality inhabited almost entirely by women of the most degraded character and most revolting habits of life. The deceased, who was a stranger here and a cripple, having but one arm, was decoyed to an upper room, approached by a narrow and crooked stairway, while in an advanced stage of intoxication. On leaving this den and on the stairs he was struck on the head from behind by the prisoner, and felled to the bottom of the steps. This blow caused his almost instant death; and this for the purpose of robbing him of the contents of his purse. These facts were sworn to by more than one eye-witness. If these facts were sworn to by unimpeachable witnesses, there is no jury in Christendom, who could have found any verdict but "Guilty," who would not be justly chargeable with non-observance of their oaths. But in this case the eye-witnesses were necessarily all men and women of the basest sort, all denizens or habitués of the slums. This condition of the evidence is what caused the "doubts" in the minds of some few of the jury, and hence the compromise verdict. The facts as above given were sworn to directly and positively by the witnesses. I venture to say that there was no single juror who did not feel morally certain that the defendant was guilty, but their doubts arose from hesitation to take human life on the oaths of such witnesses.

Now, you must admit that it would be a most dangerous rule of evidence that witnesses not otherwise impeached are not to be believed in courts of justice simply because they are engaged in disreputable occupations and lead disreputable lives, especially when, as in this case, they are not contradicted by the circumstances of the case. Were such a rule adopted, crime would go unpunished directly in proportion to the degraded character and associations of the parties thereto. How could it be possible to produce an eye-witness of high personal probity and character to the case in point?

You must bear in mind what, from your papers, seems not to have been as yet called to your attention, that in this State there are no degrees of murder, as in many other States; and for a man convicted of that crime there is but one punishment, viz., death; so that, if a jury are convinced, beyond a reasonable doubt, that a defendant is guilty, but believes that there are extenuating circumstances, it has become the unwritten law that they add to their verdict a recommendation to mercy, which almost invariably works a commutation of sentence. This recommendation is also added in cases, like the one under discussion, when, while there is no possible ground of extenuation if the charge be true, yet there is such slight doubt of the truth of the facts (not amounting to reasonable doubts as prescribed by law) as causes the jury, or some of them, to hesitate to give their entire assent to the execution of the supreme penalty of the law. And I defy any community to prove that compromise verdicts of this kind do not occur frequently in their midst.

Under these circumstances the verdict in this case was returned, and the Governor, following the almost unvarying precedent, commuted the sentence as reported. On this jury were two colored men, and the opportunity was afforded the prisoner of having more had he so desired.

Your allusion to the duty of a judge to charge the jury to resolve doubts in favor of the prisoner is, again, based upon a misapprehension. In point of fact, conviction is rendered difficult by the pointed and emphatic manner in which this injunction is impressed upon the juror, as the reading of any charge will show. In this very case his Honor impressed this duty upon the jury.

In addition to refuting particular cases which may be advanced, many others might be adduced going to substantiate the proposition for which I am contending. One case, State vs. Marshall Amaker, occurred in Orangeburg County in 1887, in which a jury of twelve white men convicted a white man charged with the murder of a negro. And, to the credit of the colored men of Berkeley County, a negro who was charged with killing a white man (I refer to the case of State vs. Nimmons) was tried by a jury consisting of one white and eleven colored men, and they brought in a unanimous verdict of guilty on the evidence.
